Preface

The first edition of the *Encyclopedia of Psychology and Religion* was published in 2010 by Springer under the joint editorship of David Leeming, Kathryn Madden, and Stanton Marlan. Since that time, the encyclopedia has been a “living” online project leading to a three-volume second edition in 2014 and now a four-volume third edition, under the editorship of David Leeming with assistance from Lee W. Bailey, Ann Gleig, and Jaco J. Hamman. Dr. Leeming taught courses in myth, religion, and literature for many years at the University of Connecticut in Storrs and has published several books on these subjects, including the *Oxford Companion to World Mythology*, and for a number of years he edited Springer’s award-winning *Journal of Religion and Health*. He is Emeritus President of the Blanton-Peale Graduate Institute, the original sponsor of the encyclopedia.

The *Encyclopedia of Psychology and Religion* grows out of the developing awareness of the need to reintegrate the studies of the mind with those of the spirit. By bringing together the disciplines of psychology and religion, it unites the two areas of thought concerned with the behavior and motivations of human beings and provides a crucial new resource for the collaboration and mutual illumination of these two fields. For those active in the study of religion, the encyclopedia offers new tools for understanding the images, structures, symbols, and rhythms that constitute the vocabulary of religious experience. For those in the field of psychology, it reveals deep patterns of meaning and practice that inform human culture and personal identity.

In our third edition, containing some 1000 entries, we have made a point of including the perspectives of scholars and clinicians outside of the English-speaking world. The result is an encyclopedia that is genuinely international in scope.

The *Encyclopedia of Psychology and Religion* serves as a valuable and accessible reference work in both electronic and print versions for academic libraries and their patrons and will be of particular use to the growing community of researchers, teachers, clergy, therapists, counselors, and other professionals concerned with the developing reintegration of the fields of religion and psychology.

Acknowledgments

The Editor and Associate Editors wish to thank the members of Springer-Verlag staff in both Germany and the United States for their support on this project. We are particularly grateful to Carol Bischoff, Michael Hermann, Andreas Maisch, Sindhu Ramachandran, and Andrew Spencer for their consistent help and support.

About the Editor

**David A. Leeming**

University of Connecticut
Storrs, CT, USA

Blanton-Peale Institute
New York, NY, USA

Ph.D., M.A. New York University, B.A. Princeton University

Professor Leeming taught for 8 years at Robert College Lycee in Istanbul, Turkey, before beginning a career at the University of Connecticut, where he taught English and Comparative Literature for 26 years.

For 10 years he worked at Blanton-Peale Institute in New York, first as Editor of *The Journal of Religion and Health* (Springer), and eventually as President of the Institute. He was Co-editor-in-Chief and Managing Editor of the first edition of Springer's *Encyclopedia of Psychology and Religion* and Editor-in-Chief of the second edition.

Research

Professor Leeming is the author of many books on mythology, including *Goddess: Myths of the Female Divine* (with Jake Page, Oxford, 1994); *God: Myths of the Male Divine* (with Jake Page, Oxford, 1996); *Myth: A Biography of Belief* (Oxford, 2002); *Jealous Gods and Chosen People: The Mythology of the Middle East* (Oxford, 2004); *The Oxford Companion to World Mythology* (Oxford 2005); *Medusa: In the Mirror of Time* (Reaktion, 2013); and *Sex in the World of Myth* (Reaktion, 2018). He is also the author of several biographies, including *James Baldwin: A Biography* (Knopf, 1994).

Abraham and Isaac

Anais N. Spitzer
Department of Religious Studies, Hollins
University, Roanoke, VA, USA

The pivotal story of the Akedah (the “binding” of Isaac) occurs in *Genesis* 22 wherein God commands Abraham to sacrifice his long-awaited and only son with his wife, Sarah. This divine dictum is considered a test, since at the last minute when Abraham draws the knife to kill Isaac, God sends an angel to stay the sacrifice, and a ram is substituted in place of his son. God rewards Abraham for not withholding his only son from God and therefore passing the test and promises Abraham numerous offspring, guaranteeing Abraham that he will be the “father of nations” blessed by God. It is Abraham’s absolute faith in God that makes him willing to sacrifice Isaac, and it is precisely this strict obedience that renews Abraham’s covenant with God and, in turn, God’s covenant with the patriarch, Abraham (which begins with God’s first call to Abraham in *Genesis* 12:1–3) and his subsequent generations. The *Akedah* constitutes the foundation of the three monotheistic (also called Abrahamic) traditions: Christianity, Judaism, and Islam. It is Abraham’s near sacrifice of his son that establishes his absolute faith in God while simultaneously defining faith within the context of these monotheistic traditions.

Qur’anic Significance

In the Qur’an, Abraham is no less a man of faith than in the Hebrew Bible. He is considered to be the first monotheist because he is “sound in the faith” and, thereby, a Muslim (one who submits to God) (3:60). The sacrifice story occurs in Sura 37:100–113. There are two notable differences. First, Abraham learns in a dream that he must sacrifice his son, and he reveals this to his son: “My son, I have seen that I should sacrifice thee” (37:101), to which his son replies, “My father, do what thou art bidden” (37:102). Lastly, the Qur’an does not specify *which* son is to be sacrificed: Isaac or Ishmael, Abraham’s firstborn through his slave, Hagar. Therefore, many Muslims assume that it was Ishmael who was offered for sacrifice, since he was the firstborn. However, according to some Qur’anic scholars, there are an almost equal number of authoritative statements within Qur’anic tradition that consider Isaac the intended victim as there are those that point to Ishmael (Delaney 1998, p. 170).

Søren Kierkegaard

In one of his most famous pseudonymous works (penned under the name, Johannes de Silentio), *Fear and Trembling* (1843/1983), Kierkegaard uses the *Genesis* 22 account of Abraham’s near sacrifice of Isaac in order to engage in a philosophical meditation on the question of faith.

Although cast within the philosophical tradition, *Fear and Trembling* opens the question of Abraham to the individual and private sphere, thereby adding a psychological component. Kierkegaard was not the first to engage the story of Abraham's near sacrifice of Isaac philosophically. His writings were a direct response to and critique of those of the preeminent German philosopher, Georg Wilhelm Friedrich Hegel (1770–1831).

Like Kierkegaard, Hegel considered himself a pious Christian. Hegel's interpretation of Abraham appears in an early essay, "The Spirit of Christianity and Its Fate" (written between 1798 and 1799 and published posthumously), and forms the basis of what eventually matures into Hegel's idea of the dialectic, which he elaborates in his famous *Phenomenology of Spirit* (1807/1977). In his early writings, Hegel declares that "the first act which made Abraham the progenitor of a nation is a disavowance which snaps the bonds of communal life and love" (Hegel 1948, p. 185). For Hegel, Abraham the Jew characterizes "the Jewish multitude" that "wreck [s] [Jesus'] attempt to give them the consciousness of something divine" (Hegel 1948, p. 265). Abraham represents "unhappy consciousness," a term that Hegel later elaborates as "inwardly disrupted consciousness" of a "contradictory nature" (Hegel 1977, p. 126). In other words, Abraham as unhappy consciousness doesn't realize the implicit unity that underlies all things. Unhappy consciousness is but the second, unfulfilled step in the dialectical process, which moves from identity to difference to, finally, the identity of identity and difference. As such, unhappy consciousness is imperfect and incomplete, not yet having reconciled and harmonized identity and difference and realized the inherent unity of thinking and being.

Kierkegaard recovers Abraham as the highest and truest man of faith. Kierkegaard considers Abraham to be a "knight of faith" who believes despite reason and demonstrates that faith is a matter of lived experience. Importantly, Abraham also demonstrates that there is in fact a "teleological suspension of the ethical"; in other words, Abraham, the single individual, is higher than

the universal, ethical sphere. In this way, Abraham's act cannot be comprehended by reason alone nor subsumed under the ethical order, which is dictated by reason. In an act of absolute faith, the "knight of faith relinquishes the universal in order to become the single individual" (Kierkegaard 1843/1983, p. 75). The individual is higher than the universal. Furthermore, for Kierkegaard, interiority is higher than exteriority. Thus, "the paradox of faith is that there is an interiority that is incommensurable with exteriority" (Kierkegaard 1843/1983, p. 69). Faith, therefore, in its paradoxical absurdity (it is absurd since it cannot be completely comprehended by reason alone) involves a leap into the unknown. And this must be carried out alone by the single individual in the fear and trembling of uncertainty. This act and experience of faith is intimately personal and private.

Freudian Perspective

Although Freud wrote extensively on fathers and sons, he repeatedly emphasized the significance of the son killing the father, and not the inverse. In *Totem and Taboo*, where Freud discusses the Oedipus complex, the focus is on the son killing the father, even though the Greek story of Oedipus begins with Laius' attempt to murder his son. Freud, however, takes up the myth after these events have transpired in order to bring attention to the later part of Oedipus' life and to his killing his father. Even in *Totem and Taboo*, where Freud attempts to trace the origins of monotheism through an exploration of the primitive, primal horde, it is the act of the sons usurping and sacrificing the father that founds the basis for religion. Freud emphasizes sacrifice, but not of the son. Furthermore, Freud's later work in which he deals with the question of Jewishness and religion, *Moses and Monotheism*, focuses on Moses – not Abraham. The anthropologist Carol Delaney devotes several chapters of her book, *Abraham on Trial: The Social Legacy of Biblical Myth*, to this thought-provoking absence, arguing that Freud's exclusion of Abraham and his

omission of the dynamic of fathers killing sons point to “a glaring scotoma or blind spot” in Freud’s work (p. 189). Her study is an exploration of the significance of such a curious absence. Many Freudian scholars and psychoanalysts have attempted to use the Abraham and Isaac story as a corrective to what they consider to be the shortcomings of Freud’s Oedipus theory. What Delaney and others possibly overlook is the feminine element that figures predominantly in the Oedipal story and thus underlies Freud’s Oedipus complex. This component is not overtly present in the Abraham and Isaac story, and for this reason, perhaps, Freud chose Oedipus over Abraham.

Jungian Perspective

Jung’s most extensive engagement with the idea of sacrifice occurs in his work *The Sacrifice* (Jung 1956, pp. 613–682) and in *Transformation Symbolism in the Mass* (Jung, CW 11, pp. 296–448). From Jung’s perspective, sacrifice is an act of the unconscious and “the impulse to sacrifice comes from the unconscious” (Jung 1956, p. 660). From the ego perspective, however, an act of sacrifice is impossible psychologically because the ego cannot decide to make a sacrifice. Rather, “an act of sacrifice takes place,” revealing that “a process of transformation is going on in the unconscious whose dynamism, whose contents and whose subject are themselves unknown” (Jung 1956, p. 669). Sacrifice is a mystery and can never be fully understood by ego-consciousness since it is impossible to “derive the unconscious from the conscious sphere” (Jung 1956, p. 670). Thus, the “I” can neither demand nor fully comprehend the sacrifice. Jung argues that, although the conscious may like to consider itself higher than the unconscious, it is the unconscious that is greater than the conscious. In “the act of sacrifice the consciousness gives up its power and possessions in the interest of the unconscious” (Jung 1956, p. 671). The ego unwittingly sacrifices the “I.” Read in another way, just as the ego cannot choose to make a sacrifice, the “I” can’t do therapy, but therapy, nonetheless,

happens. This uncontrolled and absolute giving (which is a relinquishing of the egoistic claim and therefore not overseen by ego-consciousness), which is a form of self-sacrifice, is a self-possession (the autonomous, transcendental self which includes unconscious components as opposed to the self identified strictly with the ego and consciousness) since the self causes the ego to renounce its claim on behalf of a supraordinate authority and, in so doing, increases self-knowledge. Every advance of the self requires that the ego be sacrificed to something higher than itself, not unlike Abraham’s absolute act of giving to God.

Abyss

Kathryn Madden
National Institute for the Psychotherapies,
New York, NY, USA

Origins and Images of the Abyss

Abyss from the Greek *abyssos* typically signifies a bottomless or boundless deep. The abyss appears in biblical tradition in several related senses. In the Hebrew Bible, Genesis 1:2, *abyssos* relates to the Hebrew *tēhōm*, which most likely stems from the Babylonian *Tiāmat*, a personification of the primordial deep of waters existent before the creation of the world (NRSV). In Babylonian mythology, *Tiāmat* as the primal sea was personified as a goddess (Jacobsen 1968, pp. 104–108) and also as a monstrous embodiment of elemental chaos (Dalley 1987, p. 329).

The Egyptian worldview had a similar concept in *Nun*. *Nun* referred to the primeval water that encircles the entire world and, from which everything was created, personified as a god. In contrast to *Tiāmat*'s goddess, feminine nature, *Nun* was considered to be an ancient god, the father of all the gods, which refers to his primacy rather than literal parentage (Lindemans 2000).

Abyss became identified with *Sheol* and *Tartarus* (Job 41:24) based upon its association with notions of primordial depth and chaos. In Greek mythology, *Tartarus* was the gloomy prison of dishonorable opponents of Zeus. *The Book of Enoch* defines abyss as a place of punishment for fallen angels.

In postbiblical Jewish literature, because of its associations with chaos and death, the abyss became identified as the prison of rebellious spirits and the realm of the dead. By the time of the New Testament writing, the abyss was an abode of demons (Luke 8:31) and Hades (Romans 10:7), where the devil is imprisoned in a bottomless pit (Revelations 20:2). The Gnostics of the first century made abyss, under the name of *Bythus*, into a divine first principle, the source of

all existence, thus representing a return to an original unity.

The images of the abyss throughout the Judeo-Christian era traditionally have been symbolic of hell, destruction, or death with the exception of the Gnostic myth which attributed to abyss both the source of life and life's return to this source. The Gnostics, along with their myths, were persecuted and eliminated as being heretical to the canonical truths of the mainline Church.

Psychoanalytic Perspectives

Contemporary psychoanalyst James Grotstein speaks of the abyssal experience as “the black hole” of nothingness, meaninglessness, and chaos – a “zero-ness” expressed, not just as a static emptiness but as an implosive, centripetal pull into the void (Grotstein 1990, pp. 257–258). Grotstein, from the neoclassical school of Freudian psychology, views the abyss of the black hole as “nameless dread,” an empty matrix and “container” of meaninglessness (drawing from Wilfred Bion 1962, 1967). The abyss or void is associated with the death instinct which prepares us to anticipate and to adapt to the ultimate horror of death. This black hole is the “preperception” of an experience-released anticipation which warns us of the extinction of the psyche.

Grotstein claims from clinical experience that “the minds of patients suffering from primitive mental disorders . . . are hypersensitively vulnerable to the detection of randomness and meaninglessness; they often substitute archaic, apocalyptic (meaningful) scenarios in order to prevent their minds from dissolving into the maelstrom of nothingness” (Grotstein 1990, p. 265). Failure to tolerate the gap and its empty nothingness causes a default into “no-thingness. . .” (Grotstein 1990, p. 273).

Grotstein primarily focuses upon the borderline disorder and psychosis in which the person experiences “a spaceless, bottomless, timeless and yet, paradoxically, condensed, compact, and immediate yielding suffocation anxiety” (Grotstein 1990, p. 281). Truly, psychopathology may prevent an individual from achieving

sufficient meaning in the self and object world. A borderline or psychotic condition might make it impossible for the person to withstand the entropic pull toward nothingness and meaninglessness – ultimately toward chaos (randomness), the traumatic state, “the black hole” (Grotstein 1990, p. 286). Yet, there are nonpsychotic states of being in which a person may experience the void, or “black hole” of nothingness, and return to a world of meaning.

Alternative Views of the Abyss in Analytic Psychology and Religious Experience

The more typical notion of abyss that has been passed down through history is like the sea; we fear being pulled down into the abyss to our annihilation. Yet, there is something about the abyss, as there is about the sea that exerts a strange pull on us.

There are alternative psychological understandings of the notion of abyss. Two examples of the abyssal experience were manifested in the imagery of Jacob Boehme, a seventeenth-century German shoemaker and religious mystic, and Carl Jung, the twentieth-century Swiss psychoanalyst. Both men gave witness to this layer of existence as not so much the “abyss of hell” but as a symbol of a unitary reality.

Boehme’s abyss, which he called the *Ungrund*, or un-ground, was preexistent, underlying all of creation, even God. Jung’s notion of the Self exists before the beginning of the individual human being and is our ultimate goal in terms of psychological life.

The abyss, for Jung, analogous to the objective unconscious, and the *Ungrund* for Boehme provided for both men a “window to eternity.” Boehme was enabled to see through to the constellated reality of Christ, and for Jung, to the Self; for both, to something that points beyond itself to a transcendent ultimacy.

For Boehme, the abyss is a Self-revealing reality that gives life to the world but is itself a mystery. Spirit meets us as a dynamic reality at the abyss level and points beyond itself. Beyond

what we know, we receive glimpses of “conscious communion or participation in a timeless reality” (Wood 1982, p. 209).

Following a period of melancholia, Boehme allowed himself to be drawn inward to an abyssal state where he discovered a new image of God, fuller and more complete than before. Boehme’s experience inspired in him the production of a profound theme: that of the *Ungrund* (unground), a groundless abyss, a state of pre-being underlying not only all of creation but even God.

The Ungrund

The *Ungrund* is anterior to God and anterior to being. The *Ungrund* lies in the eye, the core of God and creation (Boehme 1969, 3:1, 16:16), and is eternally a mystery to God because it is what God was before God became conscious of God’s Self. The *Ungrund* is pre-distinction and preexistent and is difficult to characterize except as *ewiges Kontrarium*: the nothing is the all; the emptiness is the fullness. The *Ungrund*, or abyss, contains all antinomies, but all the contradictions are still in harmony because these contraries are only potential and not yet differentiated.

As W. P. Swainson says, “[W]ithin this Abyss is an eternal, bottomless, uncreated Will, or Byss. This Will, or Byss, ever desires to become manifest – ‘It willeth to be somewhat.’ This is only possible in a state of duality or differentiation, for without contrast there could only be eternal stillness, nothing could ever be perceived” (Swainson n.d., pp. 93–94).

The *Ungrund* (abyss) is not the personal creator God but the absolute-in-itself, a moment at the commencement of the divine life and process of self-creation and revelation of being and the divine (Boehme 1965, 1:1).

Boehme’s creation myth articulates a process in which God created God’s self from the abyss through an eternal will. In A. E. Waite’s *Three Famous Mystics*, Swainson describes how God differentiates himself from this abyss: “This Will, or Byss, fashions what is called a Mirror, which reflects all things, everything existing

already in a latent or hidden state in the Abyss. . . [and] makes them visible or manifest. The Supreme [then] perceives all things in Himself. The dual principle is latent in Him. He is both Byss and Abyss. He could not otherwise know Himself . . . Boehme terms this Mirror the Eternal Wisdom, the Eternal Idea . . . It is the Infinite Mother, the Will being the Infinite Father. . .” (Swainson n.d., pp. 93–95).

When the Will, or the Father, beholds Himself in this mirror, creation becomes active and manifests through the union of the Will and Wisdom: the archetypal Father and the Mother. The abyss for Boehme, then, is a “place” beyond time and space from which emanates all possibilities. All of creation arises from a “breathing out of God’s self” (Swainson n.d., p. 209).

While Boehme’s visions may have followed a disintegrating period of melancholy or psychic disturbance, the visions led to healing rather than disintegration. These were humbling, not inflationary, experiences, which left Boehme with a feeling of awe and gratitude. Boehme’s (1978, p. 209) visions were noetic: his inner-self gives over to divine will and speaking. He exhibited a diminution rather than an inflation of ego.

Themes of opposition – of feminine and masculine, creation and destruction, good and evil, Christ and Lucifer, Ungrund and Sophia, and life and death – abound in Boehme’s map. A comparison of his insight to that of modern depth psychology places him squarely in the realm of analytical psychology and the notion of Carl Jung’s the Self-field where all naturally occurring oppositions of the psyche are encountered, held, and united in harmonic tension.

The Pleroma

Carl Jung likewise experienced an inbreaking image of abyss, what he called Pleroma, during his 6-year *Nekyia*, or descent into the deeper layers of the unconscious. His experience of the Pleroma was that of a paradoxical nothingness containing all opposites out of which God differentiates himself.

As a culmination of a long-term process of encounter with the deepest layer of the collective unconscious, specifically the psychoid, archetypal layer, Jung believed that we, potentially, experience something analogous to what, for Boehme, would be a preexistent unitary reality.

Jung’s notion of the archetype as psychoid (Jung 1963, p. 351) alerts us to a notion in which the unfolding of the Self, an archetype that unites opposites and orders our whole psyche, is an innate bridging reality that links the material and psychical and inner and outer in one reality.

Jungian analyst, Erich Neumann describes the Self-field as a preexisting unitary reality that we developmentally emerge from. We find at a certain layer of reality a unitary reality existing beyond and before the primal split (consciousness from unconsciousness) that occurs when our conscious minds develop into a polarized reality. Except in cases of severe trauma or developmental injury, most of us have experienced this unitary reality in some form while we were in the mother’s womb or at a very early stage of development (Neumann 1989, pp. 9–10, 20).

The prenatal egoless totality is associated with an unconscious experience – which can, however, be recalled in later life as a dim memory – of an acosmic state of the world. In this totality there exists a pre-psychic “nebular state” in which there is no opposition between the ego and the world, I and Thou, or the ego and the self. This state of diffusion of the world-soul and the corresponding emptiness of the world is a borderline experience of the beginning of all things which corresponds to the mystic’s experience of the universal diffusion of the unitary reality (Neumann 1989, p. 74).

Unitary Reality

The pleromatic/abyssal experience of unitary reality is something that is there from our inception. Developmental injuries and specific traumas may impair an individual’s knowledge of this unitary reality, but unitary reality (abyssal reality) underlies all experience. Drawing from Jung (1921, para. 424), the soul is thus like a two-way mirror,

reflecting unconscious to ego and ego to unconscious.

The experience of unitary reality is relevant to clinical practice because abyssal experience is radically transforming. A new reality is born to us, offering us a new intrapsychic core, perhaps even restructuring the entire personality in a way the ego can better deal with its context and circumstances, one that enables us to see through to our former origins.

Spirit, from this view, is an a priori reality always in motion, moving toward us, shattering our consciousness, summoning us to receive that which is archetypally present and spiritually actual; as Boehme attests: (...) “to wrestle with the love and mercy of God, and not to give over, until he blessed me, ... *And then the spirit did break through*” (Boehme 1915, pp. 485–487, *italics mine*).

Active Imagination

Leon Schlamm

School of European Culture and Languages,
Religious Studies Section, University of Kent,
Canterbury, Kent, UK

C. G. Jung’s development of the dissociative technique of active imagination, the visionary practice of “dreaming with open eyes,” arose out of his early experimentation with paranormal phenomena, especially mediumship, itself a dissociative technique of contacting the dead which traces its provenance to shamanism. His discovery of active imagination led him to associate psychological and spiritual transformation with the autonomous creation and manipulation of images.

Jung’s Descent into the Unconscious

In December 1913, believing himself to be threatened by a psychosis, Jung overcame his violent resistance to experiencing a series of waking fantasies, which would provide the raw material for the subsequent development of analytical psychology (Jung 1963). In these waking visions, triggered by the suspension of his rational critical faculties enabling conscious receptivity to unconscious psychic contents (Chodorow 1997; Jung

1916/1958), Jung descended to the Land of the Dead (which he subsequently equated with the unconscious) where he encountered a number of significant *others* in the objective psyche, subjects independent of his consciousness (Jung 1963). He learned to treat the numinous figures of his inner life, Elijah, Salome, the Serpent, and Philemon, an Egypto-Hellenistic Gnostic who later functioned as his inner guru, as objective real *others* and to engage in dialog with them as equals (first verbally and later through writing, painting, and drawing) (Chodorow 1997; Jung 1916/1958, 1925, 1963), thereby discovering a meditative technique for psychological healing and spiritual transformation in marked contrast to the meditative practices of stilling the mind and transcending all images associated with yoga (Jung 1963).

Active Imagination as Confrontation with the Unconscious

The function of this visionary practice, triggering a dynamic, confrontational exchange between consciousness and the unconscious in which each is totally engaged with the other and activating a stream of powerful, unconscious emotions and impulses, Jung discovered, was to access numinous unconscious images concealed by these emotions and impulses (Chodorow 1997; Jung 1916/1958, 1955–1956, 1963). By consciously dialoging with the flow of images produced by active imagination, Jung learned to transform and control these powerful emotions and impulses, thereby discovering the transcendent function (Jung 1916/1958, 1955–1956, 1963), the union of the opposites of consciousness and the unconscious which he identified with the individuation process, as well as healing himself. However, it is important to remember that, for Jung, it is through the *affect* that the subject of active imagination becomes involved and so comes to feel the whole weight of reality. Numinous images encountered during active imagination are based on an emotional foundation which is unassailable by reason. Indeed, the whole procedure is a kind of enrichment and clarification of the affect, whereby the affect and its contents are brought

nearer to consciousness, becoming at the same time more impressive and more understandable (Jung 1916/1958, 1951, 1952/1954).

Jung was well aware that the practitioner of active imagination unable to maintain a differentiated, self-reflective conscious point of view in the face of unconscious visionary material would be vulnerable to mental illness: either in the form of psychosis where consciousness is overwhelmed by unconscious visionary materials or in the form of conscious identification with numinous unconscious contents leading to possession by them (Chodorow 1997; Jung 1916/1958). However, he insisted that his visionary practice, if approached responsibly by an individual endowed with a well-developed consciousness, could bring considerable rewards. In addition to the strengthening and widening of consciousness itself (Jung 1916/1928, 1916/1958, 1931/1962, 1934/1950, 1955–1956), dreaming with open eyes could enable the practitioner to realize that unconscious contents that appear to be dead are really alive and desire to be known by, and enter into dialog with, consciousness (Jung 1963). If one rests one's conscious attention on unconscious contents without interfering with them, employing the Taoist practice of *wu wei*, just letting things happen, discussed by Jung in his Commentary on *The Secret of the Golden Flower*, it is as if something were emanating from one's spiritual eye that activates the object of one's vision (Jung 1916/1958, 1930–1934, 1931/1962, 1955–1956). Unconscious contents begin to spontaneously change or move, begin to become dynamic or energetic, to come alive. Jung characterizes this process by the German term *betrachten*: to make pregnant by giving an object your undivided attention (Jung 1930–1934, 1935/1968, 1955–1956), a psychological process anticipated by his 1912 dream of a lane of sarcophagi which sprung to life as he examined them (Jung 1963).

These experiences which Jung characterizes as numinous, however, require a vigorous, active, self-reflective conscious response endowing them with meaning and thereby changing them (Jung 1916/1958, 1955–1956, 1963). Here lies the significance of Jung's claim that the dead seek wisdom from the living in his pseudonymously produced Gnostic

poem of 1916, *Septem Sermones ad Mortuos*, itself the product of active imagination, rather than, as in mediumistic practices, the living seeking the wisdom of the dead. The dead, numinous, unconscious contents, need the living, consciousness, as much as the living need the dead (Bair 2004; Jung 1963; Segal 1992; Welland 1997). This process of continuous dynamic interaction and collaboration between consciousness and the unconscious is expressed by the German term *auseinandersetzung*—coming to terms with, or having it out with or confronting unconscious psychic contents – and is mirrored in Jung’s religious narrative calling for divine-human collaboration underlined by his heretical observation that whoever knows God has an effect on Him in *Answer to Job*, another product of active imagination (Chodorow 1997; Jung 1916/1958, 1952/1954; Welland 1997).

Active Imagination in Western Religious Traditions

Jung himself alleged the use of active imagination in Gnosticism and alchemy on which he drew heavily in his later work (Jung 1944, 1951, 1955–1956; Segal 1992) and was clearly gratified by Corbin’s research on active imagination in theosophical Sufism (Wasserstrom 1999). However, as Merkur’s recent scholarship tracing the history of active imagination in the West has confirmed, the incidence of this visualization technique in mystical traditions is more widespread and can be found, for example, in Gnosticism, Kabbalah, Sufism, alchemy, and more recent European esotericism, as well as shamanism (Merkur 1993), thus providing considerable support for Jung’s claim that his post-Christian, psychological practice of dreaming with open eyes is analogous to, and can be understood as a detraditionalized form of, spiritual practice fostered by many Western religious traditions during the last two millennia. Merkur also distinguishes between what he calls intense “reverie” states, including Jung’s active imagination, and trance states. Whereas the latter involve the increasing repression or restriction of ego functions (or consciousness), the former would seem to involve their increasing relaxation and freedom.

and spiritual development (Bair 2003). The legacy of this remarkable man remains immense and includes not only innumerable insights into the psychic life of *Homo sapiens* but also many highly effective methods for the healing and transformation of mental afflictions and other disorders. Among such methods exists the therapeutic technique known as *active imagination*, which acts as a dynamic connecting link between the conscious ego and the unconscious, thus providing a channel through which greater psychological cohesion and wholeness can be achieved (Jung 1960).

Throughout his long existence, Jung (1963) experienced a vast array of psychic phenomena, both in his personal life and in the life of his patients. Over time he began to identify universal themes and images that arose in abundance through the human psyche, especially in dreams and in various forms visionary experience. Jung referred to such images and motifs as *archetypes*, and it was through these highly charged symbolic forms that he would later develop his conception of the *collective unconscious* as the boundless repository of humanity’s cultural, ancestral, and mythic heritage. Archetypes play a crucial role in the therapeutic process, serving as both symbolic guides through which to navigate psychic discord as well as powerful mythic forms that signify the psyche in a state of psychological wholeness.

Psychotherapeutic Applications

In line with the above theories, Jung (1963) developed the process of *amplification*, a method by which the deeper meaning of archetypal images, symbols, and dream-figures is expanded through their association with mythological, cultural, and religious motifs and metaphors – a process that has particular application within a psychotherapeutic and developmental context.

Jung (1977) stressed that these psychologically potent mythic forms are not creations of the conscious ego, but rather arise from the depths of the unconscious. For this reason, the phenomena of dreams are of primary importance in depth psychology “because dreams are the most common

Active Imagination in Psychotherapy

Judson Davis
School of Interdisciplinary Studies, Woosong
University, Daejeon, Republic of Korea
University of Freiburg, Freiburg, Germany

Introduction

The life and work of Carl Jung exemplify one of modern humanity’s most ardent examples of pioneering exploration in the fields of psychology

and most normal expression of the unconscious psyche . . . they provide the bulk of the material for its investigation” (p. 73). Jung (1963) suggested that the purpose of such dreams is “to effect a reversal of the relationship between ego-consciousness and the unconscious, and to represent the unconscious as the generator of the empirical personality” (p. 324). He chose to experiment with various techniques designed to help manifest the interplay between consciousness and the unconscious, and he viewed creative expression in particular as one of the primary means of facilitating this process. Jung also discovered that drawing, sand play, and other imaginal exercises involving archetypal imagery could be very effective in bringing clarity to vague feelings, images, and other manifestations of inner content. This proves especially useful in that “the whole procedure is a kind of clarification of the effect, whereby the effect and its content are brought nearer to consciousness, becoming at the same time more impressive and more understandable” (1960, p. 82). The ego’s direct engagement with mythic imagery thus represents one of the most essential features of this alchemical healing process, as it signals “a movement out of the suspension between opposites, a living birth that leads to a new level of being, a new situation . . . a quality of conjoined opposites” (p. 90). This intriguing phenomenon is well represented through the following dream (which arose in the present author’s own experience) and the process of psychic amplification through active imagination that followed:

I am standing in a room and am engaged in a conversation that reveals with great certainty that at a later date I will be involved in the dissemination of Jung’s theories to a wider audience. This realization is accompanied by a strong sense of personal pride at the prospect of professional accomplishment and recognition in the outer world. Then I suddenly pass through a curtain and find myself on a football field preparing to kick a field goal that will signify my success in this endeavor; but when I kick the ball, it hits the base of the goal post, and falls short. Then I wake up. (Davis 2015, pp. 38–39)

Having been left with the undeniable sense that this dream had special significance, and having been confused by the seemingly

contradictory messages it provided, I was intent upon discovering its deeper meaning. To accomplish this beguiling task, I engaged in the practice of active imagination, which was created by Jung (1960) as an imaginal exercise in which one reenters the dream in a conscious state by focusing intensely upon a primary image and then allowing the ensuing *inner drama* to unfold of its own accord and toward its own completion. In this case, the goal post was clearly the most prominent symbol in my dream, and so, with this image firmly in mind, I proceeded to close my eyes, concentrate my focus, and then experienced the following:

In a short time I found myself again on the football field, this time playing quarterback. Each time I tried to pass the ball, I was quickly tackled. Finally, I decided to keep the ball and attempt to cross the goal line by my own volition, and was then able to maneuver my way through the defense, ultimately being brought down as I successfully crossed the goal line. As the football I was carrying touched the ground, it suddenly turned into an enlarged, glowing blue diamond, and this was accompanied by a wordless telepathic communication that can only be described as a sacred revelation, one that arose from a deeper part of myself that I rarely have direct access to, and yet somehow instinctively know to be my *true self*. And what this communication revealed to me was that the *goal* in life is not about achieving success or status in the outer world, but rather, the true meaning of this life is to reconnect, to return *home*, to the very source of one’s being. (Davis 2015, p. 39)

This profound and utterly illuminating experience could not have been anticipated nor constructed by one’s conscious ego, as it had unfolded from an unfathomable place within that transcends the waking self. Further, its strikingly numinous nature served to confirm Jung’s (1964) theory of universal archetypes, as the diamond exists as one of the primary representations of the *Self* (i.e., the totality of psychic life) and has manifested as a sacred symbol of spiritual radiance, purity, and indestructibility in an array of diverse cultural traditions throughout world history. It also proved to be a compelling testament to how the unconscious acts in a regulatory capacity (Jung 1960), compensating for the misguided direction of the ego through the spontaneous manifestation of mythic symbols, a process that

combines aspects of one's contemporary personal existence (i.e., the goal post) with archetypal imagery from the collective unconscious (i.e., the blue diamond), resulting in a sense of deep personal meaning and psychic wholeness (Davis 2015).

This potent interplay between these two fundamental aspects of the human psyche was described by Jung as "the beginning of the transcendent function, i.e., the beginning of the collaboration of conscious and unconscious data" (1960, p. 82). He strongly emphasized this psychic relationship as being central to the healing process (and to the broader process of *individuation*, or spiritual development) and stressed that "the suitably trained analyst mediates the transcendent function for the patient, i.e., helps him to bring conscious and unconscious together and so arrive at a new attitude" (p. 74). This process is two-fold in that it has the effect of helping the client out of a state of contracted focus (e.g., ego restricted or depressive states) and subsequently moves him into closer contact with the sphere of the total personality. Engagement with this deeper sphere of being is facilitated through the psychic magnification and assimilation of key symbols and archetypal forms that arise from the unconscious, and it is through such creative methods as active imagination that the amplification process can be brought to its most preeminent and revelatory potential.

Conclusion

Active imagination represents a method by which archetypal imagery arising from the unconscious can be applied in a therapeutic context to bring clarity and meaning to one's life and inner processes (Jung 1960). By assisting individuals in their engagement with these vital psychic aspects, the therapist helps to facilitate a transformative process by which the images can speak their own intrinsic truth through the client, a process that "helps the patient interact with the image being expressed in order to see more metaphorically his or her daily struggles, fears, and preoccupations" (Watkins 2003, p. 198). Further, it is

within this framework that a therapist can best offer guidance in an "individuation process whereby people could find their own direction and live according to their own sense of purpose" (Singer 1972/1994, p. 135). This approach presents each human being with the possibility of genuine insight and healing because "the analytical process is a means of systematically drawing upon the resources of the unconscious and progressively integrating these contents into consciousness" (p. 15). The process of active imagination provides a dynamic means by which these restorative and expanded states of consciousness can be fostered, thus providing the practitioner with a decisive channel through which to merge with the deeper aspects of one's being.

Adam and Eve

Stuart Z. Charmé

Department of Philosophy and Religion, Rutgers University, Camden, NJ, USA

One of the central features of creation stories in most cultures is a description not only of the genesis of the cosmos but also of the appearance of the first human beings. Such stories often serve etiological purposes, explaining the origin of the different forms and characteristics of human beings. The Biblical story of Adam and Eve is the most well-known and influential story of human creation and is often used as a “proof text” justifying particular values and models related to family, marriage, sexuality, and gender roles. Yet it is important to remember that creation stories are a form of religious myth. Their importance and meaning do not lie in the literal, historical accuracy of their details, and to focus on such issues misses the level on which their power and truth exists. The Adam and Eve story offers profound theological and psychological insights about human beings’ place in the world and their relationship to each other and to a transcendent dimension of reality. Biblical editors linked the Adam and Eve story (Gen. 2) with the 7-day creation story that precedes it (Gen. 1) as a further elaboration of the nature of the sole creatures who were made “in the image of God.” The famous story of Adam and Eve’s loss of paradise as a result of ignoring God’s instructions has a far more complex message than that disobeying God is bad. Indeed, Jewish tradition takes little notice of Adam and Eve and certainly does not hold them up as the main reason for a flawed human nature. Only later are they elevated to their Christian status as the original sinners.

The multidimensional nature of religious myth makes it impossible to encompass the full meaning of a story in any single psychological interpretation. Nonetheless, psychological approaches to the Adam and Eve story help us to attribute meaning to the peculiar details in this story: a man created from earth, a woman born out of his rib, a

tree with forbidden fruit, a seductive serpent, nakedness and shame, punishments and expulsion, etc.

Psychoanalytic Interpretation of Adam and Eve

From a psychoanalytic perspective, religious myths are expressions of both conscious and unconscious human struggles, projected onto archetypal figures. Accordingly, one way to look at a story like that of Adam and Eve is to see it as an expression of the struggle between fathers and sons and the ambivalence of their attachments to one another. On the one hand, it emphasizes the importance of the son’s subordination and submission to the authority of the father. For Freud, God is both a loving and protective father but also one easily provoked to anger and punishment. He represents the power of the superego to keep instinctual desires under control. Yet the story also contains a thinly disguised expression of Oedipal revolt, not simply in the son Adam’s striving to become like God the father through the acquisition of knowledge but also in giving expression, yet simultaneously condemning, the forbidden intimate relationship between mother and son. Such an interpretation is able to make sense of some of the peculiar details of the story and the obvious suppression of a mother figure. Taking the story at face value, Adam has a father but no real mother, and even Eve is born out of a male body. This creation of Eve out of Adam’s rib makes more sense, however, as a disguised inversion of their true relationship, for it is out of the bodies of females that males are born and it is only a mother who can rightly call her child “bone of my bones and flesh of my flesh” (Gen. 2:23). If Eve, who is later called “the mother of all the living,” is regarded as the missing mother figure in the story, thereby reconstituting the Oedipal triangle, then the nature of Adam and Eve’s sin is thrown into a whole new light. God the father forbids his son Adam the one kind of instinctual knowledge that a father and son should not share. A phallic serpent who tempts Adam and Eve to taste the fruit, a sense of shameful nakedness after

the act, and a punishment that highlights female desire, pregnancy, and childbirth all offer a strong subtext of sexual taboos that have been violated in this story. Confirmation of this view may be seen in Adam and Eve's very first act after their expulsion from the garden, their immediate exercise of the new sexual knowledge and desire they have acquired (Gen. 4:1).

Although greater responsibility for the fall is projected onto Eve and indirectly on all women, it is primarily a cautionary tale addressed to sons regarding the danger of challenging the rights and prerogatives of the father. The central characters in subsequent Christian myth can be seen as a reenactment of this same Oedipal ambivalence. This time, however, it is through absolute obedience to the authority of God the father that Jesus, the second Adam, and the Virgin Mary, the new Eve, ultimately displace the father when they ascend to heaven and are seated side by side as celestial king and queen.

Jungian Interpretation of Adam and Eve

Other psychological interpretations of the Adam and Eve story do not see the fundamental tension in the story as related to sexual prohibitions and violations. For many of them, the fall of Adam and Eve describes the difficult process of human growth and development. For Jungians, for example, the garden of Eden is an archetypal expression of primordial wholeness that is both the origin and ultimate goal of human life. At the beginning of human consciousness, there is an undifferentiated unity between the individual psyche and nature, God, and the unconscious. The story of Adam and Eve is an account of the growth of consciousness and the emergence of an ego with awareness of the tension of opposites in human life. Thus Adam is created not as a male, but as the original union of male and female in all human beings. The creation of Eve represents a breakup of the original wholeness of male and female that ideally is still reflected in individual human personality. The serpent is not a dangerous character tempting humans with sin, but rather a symbol of wisdom and the renewal of life. From

this perspective, the eating of the fruit of the knowledge of good and evil represents a growth of consciousness that brings an awareness of all polarities and opposites. The couple's self-consciousness about their nakedness describes the inevitable dawning of ethical consciousness and a more mature awareness of gender differences.

The Fall Story and Psychological Development

In this context, the story of Adam and Eve is not about a tragic mistake that condemns humanity, as traditional Christian theologians have contended, but rather about a difficult but necessary step in the psychic growth of all human beings. Adam and Eve achieve a new level of consciousness, but it comes at the cost of feeling alienated, separated, and expelled from their childhood paradise. While the story is typically viewed as an endorsement of what Erich Fromm has called "authoritarian religion," in which obedience to divine authority is the cardinal human virtue, it also implies something quite different. Fromm points out that the authoritarian model of religion leaves humans alienated, infantilized, and impoverished by projecting all of their human powers for love, knowledge, and freedom onto an external deity. He insists that such a position contradicts the more humanistic perspectives within the Biblical tradition. At a deeper, more subversive level, the message of the story is to emphasize the painful necessity of breaking free from the security of a childhood that is governed by parental authorities and to assume the knowledge and responsibility necessary to create new relationships, build new families, and determine one's own path in life. And this, many argue, is not really disobedience to divine command as much as a fulfillment of human beings' mature spiritual capacity.

In some ways, the Adam and Eve story is therefore a developmental story, describing the struggle of adolescence to separate and individuate from one's parents. Paradoxically, the process of becoming an adult, i.e., being like God, only can happen through an act of disobedience which

challenges the absoluteness of parental authority. And it is a story that emphasizes the centrality of human relationship to realize this process, for it is not good for man to live alone, physically or psychologically.

The story offers no lament that Adam and Eve might have done otherwise and perpetually remained in paradise. Rather, the loss of paradise is inevitable and inescapable, and it enables man to become a partner with God in the redemption of the broken and alienated dimensions of the world.

Patriarchal or Feminist Approaches to Eve

It is hard to talk about the Adam and Eve story without considering its complicity in persistent misogynistic elements within Biblical tradition. Such interpretations have constructed women as spiritually inferior, psychologically weak beings who need to submit to their husbands in particular and male authority in general for the good of all. The story has traditionally been used to reinforce images of women as temptresses and to justify the religious, social, and political subordination of women. In the original cultural context of this story, we can also find evidence of patriarchal religious leaders' efforts to delegitimize religious symbols and ideas associated with sacred images of female power from surrounding cultures. Wisdom-bearing serpents and trees with life-giving knowledge about fertility were likely references to elements of older religious traditions emphasizing connection with the life-giving power of the earth, often symbolized by goddess figures. The Biblical version transforms these elements into manifestations of rebellion and disobedience and implies greater culpability to the female character who first gives in to temptation.

Some recent feminist reinterpretations of this story offer more sympathetic readings of Eve. If the underlying psychological message of the story involves the difficult yet necessary process of growing up, the dawning of conscience, intellect, desire, and sexuality, then it makes little sense to demonize the character who initiates this process. In this reading, Eve is not gullible and weak but

rather a strong, decisive, and courageous woman who actively seeks new knowledge and experience. As with other important religious myths, the central characters of this story have been rediscovered and reinvented by modern readers in response to the concerns and issues of our time.

Adler, Alfred

Melissa K. Smothers
Department of Behavioral Sciences, School of Education, Department of Educational Psychology, Mount Mary University, University of Wisconsin-Milwaukee, Milwaukee, WI, USA

Background

Alfred Adler (1870–1937) was an Austrian psychiatrist and recognized as one of the fathers of modern psychotherapy. He was born in Vienna in 1870 and decided at an early age that he wanted to be a doctor in order to “fight death.” He was the

second child in a large family and suffered from numerous illnesses as a child. He studied medicine at the University of Vienna and preferred not to treat a client's symptoms in isolation, but rather considered the whole person, including their social setting.

In 1902, Adler was asked to join a weekly psychoanalytic discussion circle and became an active member in the Vienna Psychoanalytic Society; other notable members included Sigmund Freud and Carl Gustav Jung. However, after 9 years, he and about a dozen other members split from the society over theoretical differences. He went on to form the Society of Individual Psychology, which emphasized the role of goals and motivation in people's behaviors. Adler developed his theory of *Individual Psychology*, using the word individual to emphasize the uniqueness of the personality. In the year after leaving the Vienna Psychoanalytic Society, he published *The Neurotic Constitution*, which outlined his theory.

During World War I, Adler served in the army as a physician and became increasingly aware of the necessity for humans to live peacefully and develop social interest, in which one feels as they belong with others. After the war, Adler's concept of *Gemeinschaftsgefühl* or social interest/social feeling became a central aspect of his Individual Psychology theory. He went on to develop child-guidance clinics throughout Vienna and was the first psychiatrist to apply mental health concepts to the school environment.

By the mid-1920s, the *International Journal of Individual Psychology* had been founded and published until 1937; it resumed publication after World War II. Between 1914 and 1933, Adler published more than a dozen books, including *The Practice and Theory of Individual Psychology*, *What Life Should Mean To You*, *Religion and Individual Psychology*, *Social Interest: A Challenge to Mankind*, and *Cooperation Between the Sexes*. Due to the rise of Nazism in Austria and similar to other Jewish people of his generation, Adler left Europe and settled in the United States in 1935. While on a European lecturing trip, Adler died suddenly of heart attack at the age of 67.

Individual Psychology

Individual Psychology suggests that people are responsible for their own choices and the way they deal with consequences. In this theory, humans are self-determining, creative, and goal directed. When individuals are able to understand their goal in life, they can see the purpose of their own behavior. Adler sees each individual as a unity and viewed all problems as social problems. Adler viewed the answer to life's difficulties as social interest or the feeling of connectedness with the whole of humanity and that each person must fully contribute to society. According to Adler, the true meaning of life is to make a contribution to the community.

In Adler's view, religion was an expression of social interest. His theory of Individual Psychology has religious undertones in that his definition of social interest is similar to those religions that stress people's responsibility for one another. While Adler did not believe in God or in the Bible, he did collaborate with clergyman. His book, *Religion and Individual Psychology*, was coauthored with Reverend Ernst Jahn. Adler believed that if clergy had training in Individual Psychology, he would be able to make greater accomplishments in the arena of mental health and hygiene. Adler believed that there are many religious initiatives that try to increase cooperation, and he stated that there are many paths that lead toward the ultimate goal of cooperation.

As compared to other systems of psychology, Individual Psychology and Adlerian psychotherapy have been more open to spiritual and religious issues. The Adlerian position toward religion is most commonly positive, viewing God as the concept of complete perfection. Adler defined God as the human understanding of greatness and complete perfection. As opposed to Freud, Adler viewed God as the conceptual idea of perfection, not as an internalized parental image.

One of Adler's most prominent ideas is that humans try to compensate for inferiorities that we perceive in ourselves. He developed the idea of inferiority complex, as well as the goal of superiority. A lack of power is often at the source of the feelings of inferiority. One way in which religion

enters into this is through beliefs in God, which are characteristic of one's attempts at perfection and superiority. In many religions, God is often considered to be perfect and omnipotent and instructs people to also strive for perfection. The person, who is always striving, is aware that he or she cannot experience such perfection but that having a goal defines life. By attempting to identify with God in this way, people compensate for their imperfections and feelings of inferiority. Adler believed that the idea of God inspires people to act and that those actions have real consequences. One's perspective on God is important because it embodies one's goals and guides social interactions.

Numerous authors have compared Adler's Individual Psychology to Confucianism, Buddhism, Judaism, and Native American religions. In the literature, Christianity appears most frequently cited as having similar tenets with Individual Psychology. For example, there are considerable commonalities between the basic assumptions of Christianity and Individual Psychology regarding the view of humans. Both view individuals as creative, holistic, social oriented, and goal directed and emphasize equality, value, and dignity of humans. A focus within the Christian Bible is on human relationships, with God, oneself, and others and provides guidelines for relationships for living with others. Humans are responsible for caring for one another, emphasized both in the Old Testament and in the teachings of Jesus. Both the Bible and Adlerian psychotherapy emphasize the relationship between spiritual-mental health and social interest. The Bible's decree of love one's neighbor is synonymous with the Adlerian concept of social interest.

Individual Psychology and Buddhism are both based on holism in their understanding of the human mind because they believe there are no conflicts between elements of the mind. Yet, while Buddhism applies holism to understanding the structure of the universe, Individual Psychology recognizes conflicts between the individual and the world. Individual psychology denies the idea of the self as separate from the rest of the individual; no self exists apart from the whole.

Similarly, Buddhism denies the existence of the self as such.

The view of human distress can be viewed in corresponding terms from a Buddhist and Adlerian perspective. In Adler's Individual Psychology, an individual strives toward his or her life goal while inevitably facing specific difficulties in his or her life, referred to by Adler as life tasks. When facing difficulties, the person feels inferior; therefore, striving toward one's goals leads to feelings of inferiority or suffering. Likewise, in Buddhism, three thirsts cause suffering: the thirst for pleasure, the thirst to live, and the thirst to die. In addition, in Buddhism and Individual Psychology, all conflicts are interpersonal and occur between the individual and life events; they both deny intrapsychic conflicts. Life unavoidably produces interpersonal conflicts and these conflicts make an individual suffer. In contrast to Individual Psychology, Buddhism asserts that the awakened or enlightened do not deal with conflict in the world. Through three ways of studying, a person can understand that the conflicts he or she has in life are only illusions.

Adoption

Ronald Katz
New York, NY, USA

The Bible doesn't "speak" to us in words about adoption but conveys great insight through its stories. It teaches us by example. Adoption consists of two parts: the relinquishment of the child by the parent(s) and the adoption of the child by a new parent(s). In the Bible, the relinquishment of the child is always associated with the threat of death to the child. In the first instance, Abraham relinquishes his son Israel to G-d while expecting that it will result in his son's death. In the next story of adoption, the mother of Moses is forced to relinquish him by placing him in the Nile River in order to save him from certain death. In the story of Esther, not part of the actual Bible itself, relinquishment comes about as a result of the death of Esther's parents. In a related example of relinquishment in the Bible, two women appear before King Solomon claiming to be a baby's mother, and when the King threatens to kill the baby by cutting it in half, the real mother relinquishes the baby to the other woman in order to save the child's life. In ancient classical literature this association between relinquishment of the child and

death manifests itself in Sophocles' trilogy about Oedipus. Here the relinquishment of the child Oedipus takes place with the expectation of death to the child as a consequence. The thread running through these stories is that the bond between parent and child is of such primal significance that it can be broken only as a matter of life or death. The Bible does speak to us in words about the attitude toward relinquished orphan children and so does the Qur'an. In the world of Islam, the orphaned child is treated with great love and care. The Prophet Muhammad (peace be unto him) once said that a person who cares for an orphaned child will be in Paradise with him. The Qur'an gives specific rules about the legal relationship between a child and his adoptive family. The child's biological family is never hidden; their ties to the child are never severed. The adopted parents are like loving trustees and caretakers of someone else's child. In the Bible there are references to orphans: the repeated attitude is that they should be treated with special consideration and that it is a blessing to those who care for them. This attitude is manifested in the stories depicting relinquished children who are delivered into loving hands. When Abraham relinquishes his son Israel, G-d immediately sends an Angel to protect Abraham's relinquished son Israel from death and then promises such a wonderful future that all of his family (descendants) will inherit the surrounding lands which were (eventually) named Israel after him. After Moses was relinquished, he was rescued from the Nile River by the Pharaoh's loving daughter who protected him from the Pharaoh's death decree, arranged for his biological mother to nurse him, and raised him to be adopted into the Pharaoh's family. Esther who was relinquished as a result of her parent's death was adopted by her loving uncle Mordecai who protected her from the wrath of the Persian ruler by hiding her Jewish origins. And in the related story about the mother who relinquished her baby to King Solomon's judgment in order to save the child's life, King Solomon gives the baby back to his loving mother. In the Classical Greek story about Oedipus who is bound and abandoned in the wild by his parents, he is found and delivered into the loving hands of King Merope and his Queen

and raised as a noble. And what is the outcome one can expect from this loving care of the adopted child – nothing less than a loving, faithful, and loyal offspring.

These scriptural and classical literature stories teach us that our love and support of the adopted child will be rewarded with the love and loyalty of the child in return. In today's time there is controversy over whether the adopted child should be aware of his adopted status. What insight is shed on this subject by these religious and classical sources? The Qur'an quite clearly spells out in words the view that the child's awareness of his adoptive status is very necessary. The adopted child must retain his/her own biological family name (surname) and not change it to match that of his adoptive family. There can be no doubt or mystery about the adoptive status of the child. The Bible conveys the importance of this awareness again in its stories. Abraham is accepted and his son adopted into the religion of one G-d, Judaism, and this "adoption" is proclaimed to the world and fought for.

Esther is knowingly adopted by her Uncle and raised in accord with her racial and religious roots. She is loyal to her adoptive parent to the point of risking death to please him by confronting the Persian King. And later when the relinquishment of the Jews by genocide from their adoptive home in Persia is sought by the Prime Minister Haman, Esther again risks her life in loyalty to her adoptive father by proclaiming to the King her secret, that she is a Jew.

These stories also illustrate the contrasting effect on the adopted child of adoption unawareness. Moses' adoption was transracial, a Hebrew child in an Egyptian family. His adopted family was the ruling class of the country, while his biological roots were with the enslaved class. We are given the impression that he had no knowledge of his adoptive status growing up until he is regarded as "brethren" by the Hebrew slaves he was supervising. We can surmise that he may have had unspoken conflicts and identity confusion that couldn't be revealed and acknowledged. Moses is portrayed as a poor communicator who struggled with rage in the Bible. At one point he explodes and

kills an Egyptian overseer who was brutalizing some Hebrew slaves. The mixture of anger, fear, and guilt often underlies the many reports of the high incidence of anger in adoptees. The strength of Moses' loyalty to his adoptive family was made evident by his self-imposed exile from Egypt which lasted for as long as the Pharaoh lived.

Not knowing one's biological roots puts one in danger of violating a fundamental human taboo against incest which the adoptee who lacks specific knowledge of his biological roots is subject to. Islam specifically addresses the issue by insisting on clear demarcation between blood relationships and nonblood relationships. The Bible's solution is exemplified in the story of Moses. In his years of self-imposed exile, Moses marries a non-Hebrew, thus avoiding the possibility of incest when he establishes a family of his own.

What do we learn about the road from identity confusion to identity resolution? Moses' identity crisis is resolved and solidified by the recognition of and reunion with and the support of his birth family. This reunion helps him accept himself as a Hebrew and as G-d's spokesman. In his mission to gain the relinquishment of the Hebrews from their adoptive home in Egypt, Moses repeatedly confronts the new Pharaoh of Egypt. Here too the relinquishment of the Hebrews from Egypt is only brought about after their children were threatened with death by the Pharaoh. In this story, the Pharaoh acts on his murderous feelings toward the Hebrews as he tries to prevent their separation from Egypt by ordering the death of the firstborn Hebrew children and later by trying to kill the Hebrews after allowing them to leave Egypt. The Pharaoh's murderous decree against the Hebrews results in the death of his own child and the destruction of his army. We see that the suppression of the adoptee's true identity results in conflict and ultimately destruction to the suppressor.

In the story of Oedipus, we see the consequences of not knowing the true biological identity played out in dramatic fashion. In the story of Oedipus, his adoptive roots are not consciously known to him. He is an unknown puzzle to

himself as exemplified by the problem posed to him by the sphinx: Who is man? We know that his biological parents had arranged for his relinquishment by death through abandonment. We know that out of loving loyalty to his adoptive parents, he had fled them rather than risk their destruction after hearing the Oracle's prophesy that he would kill his father. The inevitable outcome is that he kills his biological father and had an incestuous relationship with children by his biological mother. The incestuous dangers of the adoptee's ignorance of his true biological roots are brought "to life" in this play. The play too adds to the insight that loving care of the orphan by the adoptive parents results in a loving and devoted child, whereas murderous action toward the child brings about a murderous reaction. The lack of conscious knowledge of one's adoptive and biological origins is portrayed here as causing turmoil and conflict in the life of the adoptee.

These ancient insights have also been reflected in the writings of psychoanalyst and adoption specialist Florence Clothier (1943) in "The Psychology of the Adopted Child" who wrote "... the severing of the individual from his racial antecedents lie at the core of what is peculiar to the psychology of the adopted child." "... the ego of the adopted child ... is called upon to compensate for the wound left by the loss of the biological mother. Later on this appears as an unknown void, separating the adopted child from his fellows whose blood ties bind them to the past as well as to the future."

What are the common threads that run through these writings:

1. Adoptive parents who raise their children in a loving way will have loving children who will not destroy them with their aggression.
2. Acting out of primal hostile impulses by parents toward their children begets the acting out of primal hostile impulses toward themselves.
3. Acknowledgement of adoption can help prevent incest.
4. Knowledge of one's true "core" is essential for mental well-being.

Affect

Jo Nash
Sri Lanka International Buddhist Academy,
Kandy, Sri Lanka

Definition

Affect is a term used in psychology to denote the broad field of emotional- and mood-based experience of the human subject and is a concept deployed in the poststructural theory of Deleuze and Guattari (1987) and related fields of social and cultural theory, to describe the means of visceral communication which invests the experience of relationship between an organism and its environment with meaning, in the broadest possible sense. Protevi writes, "An affect is that which a body is capable of, and so the affectivity of conceptual personae becomes materially grounded in what Alliez will later not hesitate to call a 'biology of intellectual action'" (Protevi 2005).

When we consider that affect involves embodied, visceral perception that is intuitively apprehended (Bion), is object relational, and may be both generative of cognition and a product of cognition, or even precognitive (instinctual) or trans-cognitive (integrative), we can understand that affect mediates all experience at both conscious and unconscious levels of awareness and

is an important mediator of all religious and spiritual experience. In *Affect, Religion and Unconscious Processes*, Hill and Hood write:

Insofar as religious experience involves representational worlds, or object relations, affect is hypothesised to play a central role as a mediator (that often is not associated with awareness) of such processes that underlie various behaviours (Hill and Hood Jr. 1999, p. 1018).

Affect Theory and Integration

For the psychoanalytic psychologist Silvan Tomkins (1962, 1963, 1991, 1992), who developed what has become known as “affect theory,” affect can also be understood as an important factor in motivation, in that it is generative of stimuli and also mediates the complex human biofeedback system in an attempt to sustain homeostasis. The adoption of a religious or spiritual practice can be understood to be motivated by the human need to optimize positive affect and ameliorate negative affect to achieve harmonious biopsychosocial functioning. The need to identify with a positive “Image” for Tomkins is rooted in a need to identify with the beloved parent, who resonates with positive affects such as love, joy, patience, and acceptance. This process of identification enhances optimal development and facilitates highly complex forms of psychological integration dependent on the mediation of ever more subtle affective processes or states. As McGroarty writes: “This also allows for a finer imagination . . . In addition to expanding categories of imagination and perception, this process also may be somewhat therapeutic, in cases where the event under analysis has instigated trauma . . . The feedback system is ultimately geared toward reporting on the progress toward this state [homeostasis], humans are freer than other animals because of the complexity of the Images they hold, and variety of strategies with which they may pursue these images” (McGroarty 2006, pp. 60–61).

It follows that identification with the positive Images associated with spiritually developed or integrated others, whether they are ministers,

teachers, gurus, or saints, will be a source of motivation for adopting religious or spiritual practices or values, because the processes involved enhance the ability of the human affective system to sustain homeostasis when under stress from negative stimuli, and thereby regulate itself harmoniously.

In short, identification with highly integrated persons and aspiring to become like them, by adopting practices that enable affective self-regulation, enhances happiness and well-being. A sense of freedom is also enjoyed by those with a highly developed ability to regulate their own affective states. Spiritual and religious practices are one set of tools available to enhance the development of affective self-regulation, and forms of psychotherapy that deploy elements of contemplative practices in particular have been demonstrated to be very effective in achieving this objective.

Affect Regulation and Contemplative Practice

Mindfulness-based stress reduction or MBSR (Kabat-Zinn 1990) and mindfulness-based cognitive therapy or MBCT (Segal et al. 2002) are two forms of therapeutic affective self-regulation which deploy Buddhist meditation techniques and yoga exercises to enhance affective self-management. They have been demonstrated to be particularly effective interventions in mood disorders such as recurring depression and substance abuse problems, which are often rooted in misguided attempts to use alcohol, drugs, and/or food to regulate emotions and mood.

More recently, a new type of intervention designed to regulate affect called “analytic meditative therapy” has been described by Harrison (2006) as a non-dual psychotherapy rooted in the Tibetan Buddhist practices of Dzogchen and Mahamudra, which enables “relaxed contact with absolute reality and [...] mental healing to occur spontaneously” (Harrison 2006, p. 73) through “contemplative resting in non-dual mental space” (Harrison 2006, p. 73). Such an intervention embraces the tendency of human affect to

achieve equilibrium when given the “mental space” to do so. Certain skills in contemplative discipline are required to create the mental space that enables this to occur.

The above descriptions of the role of affect in the generation and mediation of psychological states, including spiritual and religious experience, are made more interesting by research that demonstrates the converse relationship also exists. Ancient contemplative practices generate and mediate affect in predictable and repeatable ways, with meditation and breathing techniques now being used to enhance psychological well-being as highly effective therapeutic interventions in the field of mental health.

African American Spirituality

Kathy Coffman¹, Jamie D. Aten²,

 Wheaton, IL, USA

Spirituality has played a paramount role in shaping the identity of African Americans, permeating many aspects of life. African American spirituality has its roots in African religious traditions and culture (Boyd-Franklin 1989), according to which, people are born spiritual beings, and thus, religion and spirituality are an integrated part of identity. African religion and spirituality have also influenced African culture, education, social life, politics, and economics (Idowu 1992). Overall, African spirituality is very communal in nature as noted by John Mbiti, who said, “I am because we are; and because we are, therefore, I am” (1969: 108). Reflected in this quote is the idea that consciousness of oneself stems from duties, responsibilities, and privileges experienced with others.

Role of Faith

African spirituality helped those affected by slavery to nurture and promote a sense of community while under the influence of the white slave owners’ European religion (Battle 2006). African spirituality also helped those forced into slavery redefine themselves, find unity, and express inner

strength, despite their experiences of oppression. Further, African spirituality buffered white slave owners' attempts to destroy African cultural identity. Strength would be drawn from one another in secret meetings as well as through music and dance; the presence of the sacred would be celebrated through songs, beating drums, prayers, and stories (Cook and Wiley 2000). Traditional African concepts of spirituality and religion are interwoven into African American spirituality and are reflected in contemporary African American culture (Wiggins and Williams 1996). For example, a fundamental African spiritual concept that was retained by African Americans is the idea that people live in a religious universe and therefore the whole of a person's life is deeply religious. This idea includes the belief that one is connected to past, present, future humankind, nature, and God. African spirituality is the legacy of African Americans and is present in African American spirituality and culture today. Likewise, as in African worship, African American worship involves verbal and physical expression that includes the whole body and is expressed in the form of song and dance. Music and spirituality are linked in the African American culture and elements of "spirituals" reveal cultural patterns that have been sustained through the years (Wiggins and Williams 1996). These elements include the use of metaphor, symbolism, and imagery which appear in the form of blues, rap, and jazz (Wiggins and Williams 1996).

Role of the Church

Still, communalism continues to play a central role in African American spirituality that promotes a collective identity involving psychological and spiritual integration with others and the sacred. African American spirituality also continues to be an integral part of the struggle for liberation from injustices that followed slavery and has become part of the survival system of African Americans in contemporary times (Boyd-Franklin 1989; Wiggins and Williams 1996). This can be seen in the emergence of the Black church in America, for

example, which has been integral to the development of African American religion, politics, and social justice issues. Being one of the first institutions that belonged solely to African Americans, it became multifunctional and was considered a place of refuge in a hostile world (Boyd-Franklin 1989). With time, the Black church, empowered by the communal nature of African American spirituality, would be shepherded by Reverend Martin Luther King Jr., who together with the Black church helped give rise to the Civil Rights movement which was focused on eliminating the racial discrimination of African Americans.

Currently, the African American churches continue to have a communal foundation that serves as an extended family where social attitudes, values, and codes of conduct of the church and the family are interwoven (Cook and Wiley 2000; Boyd-Franklin 1989). Most African American churches continue to be representative the African American spiritual lifestyle by reinforcing the concept that the sacred exists in all things animate and inanimate (Cook and Wiley 2000). This is exemplified in the way that African American churches provide resources such as food, shelter, financial aid, child care, recreation, health care, political action, cultural expression, and mental health services to meet the basic needs of the community (Cook and Wiley 2000). On the whole, African American spirituality continues to be a significant source of strength, hope, meaning, identity, liberation, and forgiveness. It also continues to play a central role in affirming ethnic, cultural, and historic pride (Lincoln and Mamiya 1990).

Role of Clergy

Within the African American church, the pastor is viewed as the leader and spokesperson for the congregations. The modern-day pastor is representative of the tribal leaders and/or shamans of African tribes. The African chieftain was responsible for the welfare of his people acting as protector, provider, and counselor. The shaman offered spiritual guidance and was a liaison to

the metaphysical realm. African American pastors have similar duties, serving as providers of spiritual knowledge and motivation, offering guidance to the troubled, and protecting the people. The role of pastor in the African American church is one of reverence whose influence encompasses the church and the family and extends out to the larger community (Cook and Wiley 2000). As in African cultures, religious leaders are perceived as being knowledgeable professionals who are intermediaries between church members and the sacred (Idowu 1992). The pastor sets the moral foundation of the church, and members often look to pastors for help with their problems and needs (Cook and Wiley 2000). It is viewed as a pastor's duty to go to God with prayers on behalf of the individual, family, or community (Idowu 1992).

African Diaspora Religions

Alexander (Alejandro) V. Gonzalez
Strayer University, Piscataway, NJ, USA

African Diaspora Religions, also known as Afro-American and African-derived religions, refer to a system of sub-Saharan, West, and Central African spirituality that spread throughout the Americas. Many distinct groups were forcibly brought to the Caribbean, Central and South America, and the United States.

Places such as Brazil, Cuba, Hispaniola, Trinidad, and the southern United States witnessed interaction between enslaved people of different tribal affiliations. These exchanges, as well as contact with indigenous practices and European beliefs, led to the indigenization of African beliefs and practices. Practices would differ among the slaves' progeny, yet all maintained a congruent African spiritual orientation.

In this African spiritual orientation, a primal force holds the cosmos in balance and animates all things; there is a supreme, albeit distant being, that is above a pantheon of semidivinities; and semidivinities in turn interact with humans and sometimes depend on them for sustenance. Ancestor veneration is on equal footing with semidivinities, and animal sacrifice and herbal preparations and foods are used for divine protection, to elicit a boon, or to appease a semidivinity or an ancestor. Spiritual rites of passage are necessary and consecrated drums are used to invite spirits to possess followers.

An animistic spirituality, this African spiritual orientation does not readily fit into Western categories, such as the separation between secular and religious practice or between the spiritual and the material. Its concept of time is communal rather than historical (Mbiti 1969). Spiritual practices are blended with daily existence and the material world. In the *Yorùbá* oracular tradition, the material and spiritual powers can be unbalanced and ancestors and spirits speak. The ancestors must be appeased, as they can offer guidance but can also cause a spiritual imbalance, as is the case in Cuban

Yorùbá Ayoba (*Lukumí*, or *Santería*). Ancestors can be both deceased blood relatives and individuals within one's spiritual lineage. Spirits can also become attached to an individual, or enthralled, as with the Bantu *nkisi* in Cuba's Congo-based *Palo Mayombe*. Often we see a pantheon of divine spirits who must be cared for and demand action, such as the *orisha* in *Yorùbá Lukumí*, *orixá* in Brazilian Candomblé, and the *loa* of Haitian Vodoun. These semidivinities, who are often personified natural forces or tribal/cultural heroes, can also possess the practitioner and offer guidance, demand an offering, or some action.

The psychologist or scholar of psychology and religion should be open to the fact that practitioners of African diaspora religions embrace an ontology that is radically different from Western concepts of the soul and self. The etiology of persistent individual desires or problems is often attributed to the unmet demands of an attached spirit or ancestor. Psychical comfort is drawn from the understanding that there is continuity and interaction between the living and the ancestors. An individual's personality type is often matched to a deity. For example, if assertive and outgoing, the individual is said to be a *Shango*. The concept of the soul, and the self, is also composite rather than singular (Gonzalez 2010).

Besides New World religious cross-fertilization among the various West and Central African tribes, one can detect Christian, indigenous, and Kardecian *Spiritist* elements. In Brazil and Cuba, Spiritist beliefs in reincarnation and the ability to communicate with the dead resonated with ancient indigenous African beliefs in ancestor spirits. Cuban *Ayoba* (*Lukumí/Santería*), and Brazilian *Candomblé* and *Umbanda*, while discarding its philosophical underpinnings, adapted the structure of Kardecian Spiritism as a way of communicating with the dead, spirit guides, and as a useful structure to supplant death rites lost with the Middle Passage. Ethnobotany, which can have both African and New World indigenous roots, is employed for both spiritual and physical healings, and for keeping the semidivinities alive and happy. Spirits can be African or indigenous, as with the *caboclos* of Brazilian Candomblé, that possess practitioners.

Oral transmission is the preferred mode for communicating stories, teachings, and ritual preparation and implementation, although in recent years there have been efforts to commit these to writing by priests, scholars, and initiates. These African spiritualities have lost much of the stigma traditionally associated with them as slave superstition, and more recently, newer generations of participants have sought to divest practices of non-African elements, to "purify" them.

African spiritualities include *Candomblé* and *Umbanda* in Brazil; *Ayoba/Lukumí*, the *Abakuá* secret society, *Palo Mayombe*, *Arará*, and *Muertera Bembé de Sao* in Cuba; *Voudon* in Haiti; and *Obeah* and *Orisha/Shango* in Trinidad and Tobago.

Abakuá

Abakuá (Cuba), with its *Ñāñigo* priests, is a hermetic, strictly male religious mutual aid society established in nineteenth-century Cuba and directly modeled on its African counterparts, such as the Ekpe in southern Nigeria. *Abakuá* society derives its spirit beliefs from the Efik, Efut, Ibibio, and Igbo people in what the Portuguese called the Calabar region in what is today southeastern Nigeria. Initiation takes place through offering a goat and rooster to the entity *Ekue*. Society secrets and loyalty between members are strictly enforced and preserved unto death. Through the society, permitted because of the *cabildo* system in Cuba, *Abakuá* language, rites, and rituals (excepting human sacrifice) were faithfully preserved. *Abakuá* societies are structured under a king with absolute judicial, marshal, and religious powers. The king is called the *Obon Iyamba*, the custodian of *Ekue*, and presides over tribunals. Benny More and Dizzy Gillespie are said to have been members of this order.

Arará

Arará (Cuba) of Adja/Fon, Ewe, Mahi, Popo, and other Dahomey extraction, with its *Arará Dajomé*, *Arará Sabalú*, and *Arará Magino*

regional variations, is a spiritual system that arrived to Cuba late in the eighteenth century from what is today Benin. Due to contact with Yorùbá spirituality and because of its Dahomeyan background, *Arará* holds many beliefs in common with *Lukumí* and *Vodoun*, including cognate deities, ritual practices, and spiritual possession.

Ayoba

Ayoba (Cuba) is variously known as *Lukumí*, *Santería*, *Regla de Osha*, and affectionately as *La Religion*. Members prefer to say *Lukumí* or *Ayoba*. *Lukumí* is the abbreviated form of the traditional Yorùbá salutation *O-Lukumí*, meaning “we are friends” – a necessary greeting among slaves who had often been tribal enemies in West Africa. *Lukumí* has the most adherents of any Afro-Cuban religion. *Lukumí* is primarily a Yorùbá -based spirituality. As in *Candomblé*, the two main entangled strands in *Lukumí* are *orisha* (semidivinities) and *egungun* (spirits of the dead) worship. *Orisha* refers to hundreds of Yoruba tribal deities, of which only a fraction survived the Middle Passage (Fig. 1).

Central to Yorùbá, *Lukumí*, and *Candomblé* belief is the ineffable pantheistic concept of

Ashe, which collectively refers to a divine generative force, essence, existence, grace, knowledge, wisdom, and destiny. *Ashe* coalesced as the God-head *Olodumare*, and in turn gave rise to all the universe, the *orishas*, and humans. *Ashe* is the presence of the divine in all things. Although ordained practitioners are beholden to *orisha*, they consider themselves monotheists and appeal to *Ashe* in its aspect of *Olodumare* as the governing principle for their religion. As in Brazilian *Candomblé*, the presence of Catholic statuary in *Lukumí* households is traditional and used as visual stand-in for the *orishas* as well as a way to celebrate the Catholic saints’ *ashe* for their help in the preservation of the religion. *Lukumí*, like most African spiritualities, holds that all religions have *ashe* and so have truth. So *Lukumí* allows practicing other faiths.

Many *Lukumí* also consider themselves Catholic but do not mix the two faiths. *Lukumí* and *Candomblé* often also practice Kardecian Spiritism. Christian artifacts, Buddhas, Hindu deities, or artifacts from any religion may be present due to the need to appease the *ashe* of a non-Lukumí-attached spirit or spirit guide. *Lukumí* cosmology does not posit a struggle between good and evil, so *ashe* can be redirected for good or ill. Spells for protection or harm can be

African Diaspora Religions, Fig. 1 Lukumi celebration offerings. Miami, FL. (Photo courtesy of Church of the Lukumi Babalu-Aye (CLBA))

cast, but care is taken as this action establishes an eternal bond between the individual casting the spell and the target. *Lukumí* believes in reincarnation and an imbalance of *ashe* can also be attributed to a previous lifetime.

The *eleda* or *Lukumí* soul is unique to every person but very unlike the Western concept of the soul. The seat of *eleda* is said to be one's *ori*, which is the *Yorùbá/Lukumí* word for head. *El Meridilogun* refers to the 16-cowry shell form of divination. Dreams, visions, *orisha* possession, and strange occurrences are all regarded as sources of knowledge or advice from deceased blood relatives or spirit guides but, if important, must be checked against a reading of the shells for legitimacy. *El Meridilogun* is the premier diagnostic tool used to ascertain the source of spiritual or physical malady, economic hardship, and communication with the dead. The *opele* (concave shell "necklace") is used by *babalao*s (*Ifa* priests) to provide quick "yes" or "no" answers to questions. "*Obi*" (quartered coconut) is a quick form of divination used by *Olorishas* (*Lukumí* priests) during rituals to see if an offering was accepted. The *Lukumí* shells and the *Oracle of Ifa* interrogate the spiritual, emotional, physical, and financial requirements for the well-being of the individual. They prescribe ritual action to rectify any imbalance found and offer guidance to the individual regarding how to live.

Candomblé

Candomblé (Brazil), also known as *Batuque* and sometimes *Macumba*, has the most followers of any Afro-Brazilian spirituality. Although developing separately, *Candomblé* and Cuban *Lukumí* share many elements. It is an animistic Yoruba-based spirituality with elements of Bantu, Ewe, Fon, and Igbo practices. However, divination is more pronounced in *Lukumí*, while spirit possession is more prevalent in *Candomblé* (Wafer 1991). Originating in Bahia and practiced primarily in Brazil, *Candomblé* has spread to Argentina, Colombia, Panama, Venezuela, and the United States. *Umbanda* is another Brazilian religion of Yoruba provenance that relies more heavily on

Kardecan *Spiritist* practice and rejects animal sacrifice during worship.

Muertera Bembé de Sao

Muertera Bembé de Sao (Cuba) originated among Kongo slaves in the sixteenth and seventeenth centuries. Its practices have been incorporated throughout other religious traditions on the island (Dodson 2008). A *bembé*, or "drumming," uses Kongo-rhythmic sacred drumming to communicate with the spirits along with dance, chanting, spirit possession, ancestor veneration, and consultation. Percussion induces a trance-like state and *bembé* are held to invite divinities to come down and possess dancers and communicate their desires and advice from ancestors. Similar to the *gnanga* in *Palo Mayombe*, the *cazuela*, or cauldron, is filled with sacred items including human bones, rocks, sticks, and animal bones. During *bembé* the *cazuela* functions as a depository for spirits who lay dormant in it until awakened by the drums. Spirits are said to be of three types that include spirits of the dead, ancient divine spirits, and designated spirits who work with specific living human beings.

Obeah and Shango/Orisha

Obeah and Shango/Orisha (Trinidad and Tobago). *Obeah*, sometimes referred to as *Obi*, or *Obia* is a spirituality of Igbo and Efik West African origin. Similar to American *hoodoo*, *Obeah* includes beliefs in talismans, powerful spells to either ward off misfortune or cause harm, and the working of an evil or lost spirit known as *jumbie*. *Obiama* and *obiama* refer to the sorcerers.

Orisha/Shango is a West African kingdom of Oyo-centric *Yorùbá* spirituality that was brought to Trinidad by nineteenth-century slaves. As a *Yorùbá*-based spirituality, it shares many elements with *Lukumí* and centers on the *orisha* of thunder, masculinity, and sexual prowess known as *Shango*. *Shango* is a *Yorùbá* cultural hero who was deified; he is associated with lightning and sexual prowess. Ceremonies take place in a small

house called a *chappelle* and the *palais* or tent used for healing rituals. Each year a festival for *Shango* is held in Trinidad that highlights offerings, animal sacrifices, and possessed dancers.

Palo Monte/Palo Mayombe/Kimbisa

Palo Monte/Palo Mayombe/Kimbisa (Cuba), also collectively referred to as *Reglas de Congo* are Central African, Kongo, spiritualities of primarily Bantu origin. *Palo* is the second most populous African spirituality in Cuba after *Lukumí*. *Nganga*, also known by the Spanish word *prenda*, or jewel, refers to the cauldron where the *palero*, or practitioner of *Palo Mayombe*, keeps the *nkisi* spirits and the enthralled spirit. If *Lukumí* is often erroneously referred to as *Santería* or “saint worship,” *Palo* is often called *Brujería* or literally “witchcraft.” In either case *Palo* has little to do with either Christian-based satanic practices or keltic religion. The *gnanga* cauldron is filled with sacred earth that is often taken from a cemetery, sticks (hence, *palo*), human remains, animal bones, as well as other charged items and is said to do the *palero*’s bidding. Various spirits are said to inhabit the *gnanga* but each cauldron is dedicated to a specific *nkisi*. The *gnanga* is also importantly inhabited by *un muerto* or spirit of a deceased human, who is never directly related to the *palero*, and there is a symbiotic relationship established between the *palero* and *el muerto*. Divination also plays a role in *Palo*.

Voudon

Voudon (Haiti), also known as *Voodoo*, shares elements in common with other Yoruba- and Dahomeyan-influenced African spiritualities. The word “*Voudon*” is derived from the Dahomey Fon language and means “spirit” or “deity.” Voudon has many cognate deities and practices with *Candomblé* and *Lukumí*, and, due to slavery, a similar pattern of dissimulation of semidivinities as Christian saints is found. *Vodoun* utilizes drumming, initiation, divination, animal, food, and vegetative offering as a way of communicating

with semidivinities (*loa*), ancestors, and spirits. A male *voudoun* priest is called a *houngan* and a female priest is called a *mamba*. A *Voudon* temple is called a *hounfour*; its *poteau-mitan* pole found at the center serves as a vehicle for the deity to communicate with participants. *Veve*, or patterns unique to a specific *loa* whose ritual is being performed and who is being called upon, is drawn with flour or cornmeal on the floor. The *loa* attach themselves to individuals or families and function as protectors and guides. The *loa* possess participants during drummings and offer guidance or make demands.

In treating followers of African diaspora spiritualities, it should be noted that, for reasons of economy and purported efficacy, adherents of these traditions often seek the advice of a priest or herbalist before or instead of seeking the advice of a physician, psychologist, or financial adviser. Priests or herbalists may recommend the use of herbal concoctions to remedy an ill. Botanicals are individually picked from nature or purchased singularly or premixed at shops that cater to practitioners. Individuals may have attached spirits, spirit guides, or other entities that are seen as either positive or negative influences and that must also be considered during treatment.

African Traditional Religion

Danoye Oguntola-Laguda
Department of Religions, Lagos State University,
Lagos, Nigeria

African traditional religion is a debatable subject among scholars of religions in Africa. The expression “African religion” is taken in some quarters to denote the multifaceted religions that now permeate the religious space in Africa. They argue that even though these religions may have been “imported” into Africa in the last two millennia, they have been “Africanized” to the extent that they are qualified to be described as African religion. But instead here we will discuss the archaic traditional religion of the African people.

African religion is like too many other things that emerge from Africa that have been labeled by early European writers (such as Emil Ludwig, A.B.. Ellis, P.A. Talbot, Leo Frobenius) with degrading terminologies. Some of these terms that have now been jettisoned include primitive, native, tribe, savage, ancestor worship, and animism. These labels might have come out of their ignorance, due to the problems that have often retarded accurate study of African religion. These include African secrecy, demography, and lack of written scriptures. In spite of this, P. A. Talbot, Geoffrey Parrinder, A. B. Ellis, and Anthony Smith made notable contributions. Now Africans such as Bolaji Idowu, John Mbiti, Asare Opoku, P. A. Dopamu, and J. Awolalu have set the accurate tone for African religion studies.

The Anatomy of African Religion

There are basic characteristics of African religion that set it apart from other religions on the

continent. African religion has no founder who originated its theology and philosophy. Traditional religion relies heavily on ancient oral accounts embedded in the memories of the people. The religion emerged perhaps out of fear, guilt, and hope for a better earthly existence. Oracular divinities are consulted to guide the people on their theology. African religion is also non-evangelical, since believers are born into their traditions and avoid proselytization.

Belief System

Writing about African religion in Nigeria, P.A. Talbot says that “The religion of southern Nigeria would appear to be compounded of four main elements; viz. polytheism, anthropomorphism, animism and ancestor worship” (Idowu 1973, p. 110). Thus, it would be wrong to refer to it only as ancestor worship, since this only forms one of its major beliefs.

African religion has two sections: major and minor beliefs. The major beliefs are God, divinities, ancestors, spirits, magic, and medicine. The minor beliefs are derived from the major beliefs. These include belief in death, life after death, judgment day, morality, good works, social interactions, and respect for human life.

I agree with Paul Talbot: any religion must have God as the Supreme Being and focal point (Talbot 1926, p. 78). African religion is based on belief in a Supreme Being that controls the affairs of all creatures, having created them and every other thing. However, some western scholars are convinced that Africans have no concept of God. This is wrong. The worship of the high God was not imported but emerged directly in traditional African religions from the people’s long-standing appreciation of nature and insecurity on earth.

A.B.. Ellis wrongly claimed that Africans borrowed the concept of God from Christian and Muslim missionaries who visited the continent to propagate their own traditions (Ellis 1966, p. 231). Also, Emil Ludwig was reported to have said “How can untutored Africans conceive of God? How can this be? Deity is a philosophical concept which savages are incapable of framing”

(Kayode 1984, p. 8). Ludwig's conclusion reeks of bias. It erroneously suggests that God belongs to literate cultures only, and Africans who are illiterates cannot conceive of Him, due to their wickedness.

European writers were apparently misinformed mainly by differences such as the apparent fanatical devotion of Africans to the Minor divinities, the absence of obvious places of worship such as cathedrals and minarets, and lack of written revelations of God. However, Traditional Africans worship the Supreme Being through Minor divinities as a result of honor, fear, and respect. Further, the transcendental nature of God makes it impossible for Him to be confined to space since he is also omnipresent. Bolaji Idowu also argued that revelation of God to Africans cannot be denied since the numinous has the capacity to reveal Himself to man through dreams, visions, nature, and history (Idowu 1973). It is obvious that some of the degrading comments made about the African concepts of God are due mainly to the presumptuous notion of the early writers (armchair and traveler scholars) who are used to monotheistic religion like Judaism, Christianity, and Islam. To justify the existence and worship of God in African religion, there is need to engage in the study of oral traditions, such as names and attributes that Africans give to God. These will demonstrate African total allegiance to the supremacy and control of the Supreme Being, known with many names across the continent. These include Olodumare (Yoruba Nigeria), Mawu (Ewe, Togo and Benin Republic), Ngewo (Mende, Sierra Leone), and Onyame (Akans, Ghana). Underlying all these names is the fact that Africans conceive God as the creator and controller of all human affairs. As Aderibigbe observes, "He is the Lord of the heaven and earth, the creator of the world and man and the giver of life, light and sufficiency. He is timeless, eternal and everywhere" (Aderibigbe 1997). To traditional believers, God is a reality that is invisible, but whose greatness is incomparable to any other being. He is God of love, compassion, and justice. In fact social justice flows from His essence. God is the transcendent creator and benevolent judge. The belief in God is the bedrock upon which African religion rests.

The traditional African conviction is that God created incorporeal Minor divinities to assist Him in the theocratic governance of the world. They are conceived as children, messengers, agents, and lieutenants of God. It should be noted that the belief in and names of these divinities, even with common features, varies from one society to another. The Yoruba of Nigeria refer to them as Orisa, while Akans of Ghana call them Abossom. Bolaji Idowu submits that: "It is not easy to discuss this element freely for the continent. We have variation from a crowded to a situation where they appear to be scarcely in existence" (Idowu 1973, p. 112). Africans use the Minor divinities as prominent media to reach God. The relations between the divinities and the Supreme Being are manifestations of African culture, where old age and authority are venerated. For example, for any petition of the subjects to reach the king, the chiefs, princes, and princesses act as intermediaries. In the same manner, Africans find it difficult, if not impossible, to approach God directly, so they go through intermediaries – Minor divinities, gods, and goddesses. There are three categories of such divinities: primordial or tutelary divinities, deified humans, and divinities of natural phenomena (such as rocks, lakes, trees, and mountains). These divinities can be ambivalent. The attitude of the divinities is determined by the reactions of their patrons to their demands and needs. When properly propiated and worshipped with the right elements, the petitions of the worshippers are favored. There are priests and priestesses dedicated to the worship of these divinities who act as officials in their cults. Divinities vary in gender, according to the patriarchal or matriarchal nature of their society. Female patrons are more prominent in the worship of fertility deities. The shrines and altars of the divinities are often located in a grove and such places are therefore considered to be sacred and are preserved.

The belief in the spirits of ancestors also forms an integral part of African religion, since the people believe that there is the possibility of life after death, which helps overcome grief's sadness. Observing the cult of the ancestor, H.H. Farmer explains this spirit is one who "stands in peculiarly close relation to the tribe . . . from whom and

because he is still in existence, by ties as well . . . by natural affection and biblical piety” (Farmer 1943, p. 129). Africans believe that their ancestors are still relevant to their well-being here on earth. Consequently, the general belief is that communion and communication are possible between the dead and the living and that the spirits have the power to influence or molest the latter. He/she can punish amoral persons and resolve disputes based on historical alliance with the ancestors. However, not all who die will become ancestors. For anyone to qualify for the honor, she or he must procreate, contribute to the growth and development of the society, and then die at good old age. They must also die peacefully and not due to the wrath of any divinity or antisocial activities. This has a psychological and moral influence on people’s behavior. The prominence given to ancestors has made scholars such as Talbot erroneously conclude that the religion could be called ancestral worship. They are spirits, not divinities.

The last of the major beliefs are spirits, magic, and medicine. Spirits are incorporeal beings conceived to have supernatural powers that can aid human aspirations and worries. The spirits live in natural abodes, such as hills, mountains, trees, rocks, or the ocean. The attempt to control nature to do what humans will may have motivated the African belief in magic. But medicine demonstrates nature’s ability to heal physical or spiritual ailments. Herbal formulae can be used to cure or prevent “physical” ailments. But metaphysical ailments need the interventions of spiritual agents such as diviners, divinities, and ancestors. Ancient herbal medicines, such as *Digitalis*, taken from the plant foxglove and used to treat heart disease since 1785, have for years been taken from traditional peoples such as in Africa and converted to commercial pharmaceutical medications. Now African religious healers are negotiating this exchange more carefully (Goldthorp 2009).

Worship in African religion is rigid and highly ritualistic. It follows set patterns; consequently, the rituals at worship must be strictly followed to achieve the desired results. Africans engage in the worship of God through the divinities and other agents as a response to the intervention of God in their material existence. Worship is also to seek a

good heaven after death. The general belief here is that God will judge our morality and value while on earth, and those that are morally upright shall go to “good heaven” and those adjudged to be amoral shall go to the bad heaven. Bolaji Idowu describes a typical worship of God (Olodumare) among the Yoruba of Nigeria as follows:

The ritualistic worship offered to Him takes place in the open. The worshippers make a circle of ashes or white chalk and the circle symbolizes eternity, libation of water is poured on the circle. At the centre of the Circle, Kolanut is placed on white cotton by a priest. He takes the kolanut and slits it, holding the halves firmly between the hollows of his palms; he stretches them up and prays to Olodumare offering the kolanut. The priest then casts the kolanut halves within the circle. Often a white fowl or pigeon is offered in the same way (Idowu 1996, p. 96).

The chief priest is in charge of this ritual that is performed every morning on behalf of Ooni of Ife and all Yoruba people. This process is however dying out, as the Yoruba societies are now becoming cosmopolitan and sophisticated. However, there is still private worship, communal worship, and group worship. The conditions of worship are clear to all adherents of the religion. Ceremonial cleanliness and purity of heart are very necessary psychological conditions. During worship, worshippers seek forgiveness of sin and protection from God and His agents. They also seek material and spiritual blessing. Thus, worship in African religion is to show devotion to God through adoration, admiration, and love for His role in their lives. The ego is to be oriented toward serving the divine, not based on instincts. Common elements of worship are water, milk, honey, an animal victim (goat, cow, ox, dogs and pigs), maize, kola nut, bitter kola, local rum, among others. The process of worship involves invocation at the divinity’s altar, salutations, prayers for forgiveness of sins, and material and spiritual blessings.

Transformations in African Religion

In the last four decades, there have been great transformations in the practice of African religion. This is perhaps due to various responses of the believers in African religion to the opinions in

African Traditional Religion, Fig. 1 Nigerian women carrying offerings to the altar of the river Goddess Osun. (Photo courtesy of the author)

foreign scholarship that it is archaic, primitive, native, and savage in features and practices. In concrete terms, African religion has been transformed into a syncretic religion of modern times with the appropriation of all kinds of borrowed elements from modernity, globalization, cyberspace, and social networks. The religion is now popular beyond the continent, especially with Africans in Diaspora in various forms. This is the case with Candomblé (Brazil), Santería (Florida, USA), and Egungun (Cuba). Although these new forms of African religions are now active in Europe and the Americas, they are not in the pristine forms, as practiced in the African continent.

The influences of Christianity, Islam, and other Asiatic religions have transformed African religion. For example, the Ijo Orunmila traditional religion in Lagos, Nigeria, has “modernized” its liturgy so much as to conform to Christian and Pentecostal trends. It has a choir, hymn book, catechisms, and ritual officials patterned after the Anglican Church liturgy. Godianism is also borne out of political realities during the struggle for independence in Nigeria, with one of the major political parties – NCNC – playing a major role in its formation. In Kenya, there are practitioners of African religion in African Independent Churches. This is also the case in South Africa (Anderson 1993). These new movements appropriate the media, such as radio, to advance the cause of African religion (Fig. 1).

In sum, we may say that African religion is a cultural religion that developed out of African culture but in time has been influenced by other religions now predominant on the continent. It may be difficult to point to its pristine origin, but African people are so convinced of its potency and currency that they now robe it with garbs of modernity.

Afro-Caribbean: Religion and Psychology

Patrice Natalie Delevante
Richmond, VA, USA

Afro-Caribbean identity and culture interlock religion and psychology. Both religion and psychology influence each other and help define the practices, behaviors, attitudes, and thought processes of about 25 million people within 40 islands. In Jamaica, for example, Christianity is prominent; however, there are Obeah teachings along with Rastafarian culture that are prevalent and have existed since slavery. Haitians' belief and practice of voodoo determine many fates due to feelings of

nihilism dating back to slavery as well. These religions inspire radical counterhegemonic thinking and behaviors in response to race, gender, family structures, social conflicts, and government laws and customs. Psychologists observe too that such religious ideologies explain the reasons why many Afro-Caribbean persons think, feel, and behave in ways that are anti-society. Some encounter racism, sexism, discrimination, and poverty, which describes why their innermost feelings are one of nihilism and sociopolitical anxieties. Afro-Caribbean expressions, insecurities, and cognitive thinking both deny and reimagine religion and individual and collective psychological development.

Background

Slavery affected negatively the psychology of the Afro-Caribbean people. Africans were bought and sent to Caribbean islands by way of the Atlantic Slave trade during the 1600s, and they experienced forced labor in hostile working conditions on plantations. Negro labor was the cheapest and best (Matthies 2008). Many Afro-Caribbean slaves died from illness and poor and corrupt working conditions. They were exploited and treated by their slaver holders as inferior, causing slaves to view themselves as they were being treated. Slavery left blacks feeling unworthy and hopeless because the slave system eradicated Afro-Caribbean ties to Africa and individual ancestral ties to family and religion. If found practicing their African religion or customs, slaves were flogged or beaten. Since they were forbidden to practice their religion or cultural traditions, some scholars argue that most Africans thereafter lost all memories of Africa. That the psychology of the slave held beliefs that were subservient and prohibited, research suggest that such response from white slaveholders caused “psychic fragmentation.”

Religion

Religion is critical to unveiling and understanding the psyche of Afro-Caribbean identity. “Wherever

the African is, there is his religion, he carries it to the fields where it is sowing seeds or harvesting new crop" (Matthies 2008). Religion and Afro-Caribbean person are one. Religion articulates Afro-Caribbean identity and perceptions of self (Mbiti 1969). However, religious expressions were banned from slave plantations because it was considered "dangerous." Though prohibited, many slaves turned to their prior religion for emotional escape and to cope, along with retain cultural practices from Africa. Obeah was practiced and held in high esteem. Obeah believes that an individual can leave their body and visit the place where their enemy resides and causes them harm or even death (Ersine 1981). Many slaves sought the Obeah man for protection from their slave master or another slave. Nevertheless, slaveholders banned slaves from practicing Obeah and instead introduced the slave community to Eurocentric values such as Christianity.

Religion increased Afro-Caribbean's persons' Afro-centric worldview. The religion Rastafari were sought after by Afro-Caribbean persons on the island of Jamaica. The Rastafarian movement that began in 1968 in Trenchtown, answered the call for a new black liberation politics and race consciousness that placed blacks as powerful beings leading Jamaicans to Black Nationalism. Rastafarians locate Africa and Ethiopia's emperor from 1930 to 1974 Haile Selassie as their origin and spiritual source. The Rastafarians clothing and dreadlocks represented a call for black pride. They believed blacks were to liberate themselves from self-hatred and other forms of inferior thinking that oftentimes left blacks in subservient positions toward white people. Their principles labeled white bias the enemy: they hated whites and sought revenge from them (Barrett 1977). The Rastafarian movement became a religion and was adorned by Jamaican political leaders because it sought to end the black slave mentality and transform black Jamaicans into a race with cultural ties to and appreciation of themselves and Africa.

Muslim Jamaicans also sought to cease the debilitating effects of slavery prohibiting Muslim religious practices. Scholars observe that Muslims

entered into Jamaica as slaves in 1494. Slavery caused Muslims in Jamaica to come to a halt (Afroz 2003). Spiritual restlessness according to researchers caused many Muslims to experience mental erosion. Eurocentric value systems falsified Afro-Caribbean forms of religion and replaced them with oppressive forms of Christian ideals and principles.

Afro-Trinidadians also believe in spirits and demons: there are supernatural powers that can "possess" an individual, and the aftermath is oftentimes psychological torment and prolonged private and social anxiety. In Haiti, voodoo is a religion that is widely practiced. Papa Legba is understood and revered as the keeper of the spiritual world and is called upon as the intercessor. He is sought after because he alone can remove challenges. Papa Legba has been utilized by Haitians to remove white oppression. In Suriname, Winti is a supernatural god whose powers lie in fortune-telling of past and present. The god is also a healer. Afro-Caribbean societies also practice witchcraft to harm and revenge their enemies. Witchcraft believes spirits can harm a person and that that person can become possessed (Matthies 2008). Children take spiritual baths while blessings are performed over homes all to lessen and diminish spirits. Religion rescues black feelings of self-hatred and fear by introducing them to outlets that allow self to explore ways to treat and cure such low self-esteem. It has been proven valuable to increasing black survival and responses to societal negative norms.

Psychology

Afro-Caribbean persons behave, think, and feel in ways reflecting cultural norms and biases. Culture informs the psychology of the Afro-Caribbean (Matthies 2008). There exists personality disorders that have been expressed in violence and anti-society attitudes and behaviors. Many persons have retained the slave mentality of viewing whites as superior and dominant and blacks as inferior and subordinate to whites. Color prejudice that favored the Caucasian race as

superior and dominant overwhelmed the Afro-Caribbean mind-set, halting any hints of a positive individual or collective identity. As a result, their ways of thinking results in poor cognitive perceptions of self in relation to the dominant and oppressive culture and society.

The loss of African ties and memory and the dismantling of the black family shattered the psyche of the black family living on slave plantations. Scholars observe that Afro-Caribbean over time lacked conflict resolution skills and community and held high percentages in prison and mental health facilities. The cognitive development and behaviors of Afro-Caribbean people are influenced by race ideologies of the dominant hierarchy and patriarchy. Racist notions of self and low self-esteem blind Afro-Caribbean people from observing their contributions to society.

Research suggests that Afro-Caribbean experience paranoia stemming from the aftermath of living in a horrendous racist culture. Another example of paranoia is the controversial “roast breadfruit psychosis.” According to Hickling (2007), when “racial identity confusion arrives it [comes] to fruition into the roast bread fruit syndrome where a black individual sees and identifies him or herself as white. The symptoms include the need to be accepted into white society, being ashamed of one’s cultural background and attempting to alter one’s psychical characteristics to appear white” (Hickling and Hutchinson 1999). Scholars also term Afro-Caribbean societies as having a “national schizophrenia.” Afro-Jamaican society, for example, elevates white identity and status as inherently superior to blacks and the reason for the low socioeconomic status of blacks since slavery. Such thinking places Afro-Jamaican as having social anxieties and insecurities and other mental complexities when dealing with nonblacks. As a result, some have accepted color prejudice and racism.

In Trinidad and Tobago, Afro-Trinidadian performance during carnival hides feelings of a “national schizophrenia” with days of carefree living and interactions. There are studies that reveal their carnival identities as symbolic of cultural celebrations and the rewriting of

new perceptions of masculinity and femininity. Culture informs their individual behaviors and attitudes. However, in Trinidad and Tobago, there exists what scholars call the dancehall and carnival mentality. In this state of mind, Afro-Trinidadians are said to be preoccupied with “dance” and “leisure” in that they view such mind-set a way to lessen negative thinking from their socioeconomic status (Kalpos 136). As a result, many Afro-Trinidadians have gravitated toward carnival season where there is a “carefree” existence among the people, where “nonstop dance” and sexual relations are rampant. In this way, such persons become “numb” to their feelings of unworthiness and social disadvantages.

However, there are signs that reveal the consequences of such behavior during carnival season. Many Afro-Trinidadians are victims of *tabanca* defined as a loss of love or no love in return. *Tabanca* is a Trini slang, and such situation has caused behavioral irregularities and mental distress after carnival.

Conclusion

Afro-Caribbean people’s psychological wellness and disorders are a result of the religious behaviors and cultural patterns. As slaves, they were flogged and killed, and such actions melted perceptions of worthiness. Due to the flight of Afro-Caribbean persons as slaves, and the continued practice of racism, color prejudice, and discrimination by the dominant society, many from Afro-Caribbean islands have “psychological fragmentations” and/or are living with a mental illness. Today, the psychological stigma attached to persons of the Afro-Caribbean living with a mental illness is one of inferiority, unworthiness, and subservience. Many have sought religious healing and liberation along with mental and psychological health resources to overcome emotional remains of oppression. Some have requested psychotherapy. Some places in the Caribbean lack psychocultural resources for blacks. Many Afro-Caribbean persons have

migrated to other countries to escape and cope with the conflicting practices of race and identity influencing psychopathy, mental development, and expressions. The increase in mental health and psychological treatments and resources has been proven useful to managing Afro-Caribbean behaviors.

Valuable social work by psychologists has resulted in new research exploring the Afro-Caribbean psyche and its relations to religion. The cultural retention of religion and psychological services “saves” Afro-Caribbean persons from cultural genocide. Their contribution to the African diaspora remains optimistic due to religion intertwined with psychological efforts.

Ahimsa

Trish O’Sullivan

Kwan Um School of Zen, Psychotherapy,
New York, NY, USA

Ahimsa is a Sanskrit term meaning nonharming. It is the supreme virtue in the three great religions of India – Hinduism, Buddhism, and Jainism. It is the first Yama or discipline in Yoga, the first precept in Buddhism, and the first great vow in the Jain moral code. If this discipline or vow is kept then the others will automatically be attained. For example, the Buddhist precepts of truthfulness, non-stealing, control of sexual activity, and avoidance of intoxicating substances are forms of nonharm of both self and other. This nonharming ethic is said to benefit others not only through their ensured personal safety but also by the creation of a peaceful atmosphere wherein others are moved to give up their own hostility. Ashoka (268–233 BCE) was an Indian emperor that used rapacious violence to conquer and enforce his rule killing thousands. He converted to Buddhism and adopted the practice of Ahimsa. The peaceful change that followed forever linked his name with Ahimsa.

The fulfillment of ethical demands removes existing karmic impurities that create suffering and prevents the accumulation of new impurities. Just as nonharming is the root virtue leading to freedom from suffering, violence is the root cause of all suffering. Practitioners are expected to consciously minimize violence as much as is practicable so as to get rid of the violent attitudes of mind which are not suitable for meditation and will make bad karma.

While all three traditions focus on nonharming in daily life, the Jains go to relatively extreme lengths to avoid harming any creature. Some sweep the ground as they walk so as to avoid stepping on any insects and/or wear facemasks to prevent small insects from injury while breathing. The widespread custom of vegetarianism in India is related to the practice of Ahimsa.

The Indian Mahatma Gandhi utilized Ahimsa as a political tool, through which the Indian Colony achieved freedom from Britain. Other freedom fighters such as Martin Luther King Jr. in the USA successfully applied these principles in the African American struggle for civil rights. While Gandhi was certainly a role model for MLK, there is a pacifist tradition within Christianity also. Christian peace churches such as the Religious Society of Friends or Quakers closely adhere to Jesus's teaching of nonviolence.

The animal rights and environmental movements are modern examples of a growing non-harming consciousness with a positive regard toward life including both individual life forms and the natural world as a whole.

Ahimsa and Psychology

All three traditions teach that nonharming must be practiced in thought, word, and deed. Nonviolent communication involves speaking truthfully with regard for the other person and listening deeply with compassion.

Thich Nhat Hanh, the Vietnamese Buddhist Master, teaches that psychological violence against the self occurs when feelings are held back and pain ignored. Nonviolence involves being present and recognizing one's own pain or despair; otherwise, pain builds and can push one to become caught in one's views or to lash out in anger.

Psychotherapy involves the examination and reduction of violent and other self-harming thoughts and deeds. It involves the generation of compassion toward others who suffer or who have harmed one through the realization that all harm comes from others' pain.

The conscious therapist is the embodiment of nonviolence by maintaining a position of presence, listening and unconditional positive regard for the patient. It is this therapeutic stance that allows for healing to progress, eventually leading to a lessening of harming activities either internal or external in the patient's life.

Akedah

Lynn Somerstein

Institute for Expressive Analysis, New York, NY, USA

The Bible story called the "Akedah," in Hebrew, tells of the ending of ritual child sacrifice. It is frequently translated as the "Sacrifice of Isaac," but the correct translation is the "Binding of Isaac." Although the word "Akedah," in Hebrew, denotes the bound limbs of an animal prepared for ritual sacrifice, Isaac is not sacrificed.

The events of the Akedah are well known. God ordered Abraham to sacrifice his son Isaac. Isaac and Abraham climbed Mount Moriah together and approached the killing place. Abraham carried the knife, really a cleaver used for butchering animals, and the sacrificial fire. Isaac carried the wood to be used later to burn his body in an offering to God.

Although Isaac asked Abraham where the sacrificial animal was, he knew that he was doomed; he did not resist when his father bound his hands with ropes, placed him on the funeral pyre, and reached out to slit his throat. Isaac's feet were not bound – he could have run away.

Isaac submitted to his father's desire to kill him, but he was saved when an angel appeared and stopped Abraham's hand. The Lord blessed Abraham and promised to multiply his seed "as the stars in the heavens and as the sand on the shore of the sea" (Genesis, 22, pp. 17–18).

A traditional understanding of the Akedah is that God did not want Abraham to kill Isaac because murder is wrong even if God commands it, and God will never again ask for anyone to submit to such a test of faith.

An alternative understanding of the Akedah is that it expresses perfect love. Abraham showed God that he loved Him perfectly when he agreed to sacrifice Isaac, and Isaac loved Abraham perfectly when he agreed to allow himself to be sacrificed. The Akedah marks the time when literal child sacrifice was stopped; it reveals the beginnings of compassion while it exemplifies God's power and male hegemony.

Abraham thought of sacrificing Isaac, but he did not actually do so. The Akedah is an important story for theories of human psychology because it shows the growth of the human psyche as we begin to understand that words are not the same as deeds.

Often people act as though words and deeds are the same; their thoughts can be experienced as crimes, "thought crimes" deserving punishment, which can lead people to feel guilty, anxious, and depressed, even though they have not done anything wrong. One of the many goals of psychotherapy is to help people realize the difference between thoughts and deeds so that their thoughts and feelings can be examined without blame.

Isaac did not attempt to run away; he acquiesced to his father's apparent desire to kill him. Did he believe he would be saved? Might there be other reasons? Did Isaac feel compelled to comply in order to win his father's love? Maybe he was too scared to run. We meet many fathers and sons in treatment who need to answer these questions for themselves.

Alchemical Mercurius and Carl Gustav Jung

Mathew Mather

Centre for Psychoanalytic Studies, University of Essex, Essex, Colchester, UK

Alchemy and Mercurius

In alchemy the figure Mercurius has a close association to the substance quicksilver and to the

planet Mercury and therefore also to the Greek Hermes. Indeed the term *Hermetic Art* associates directly to this figure.

As a substance, the element mercury exhibits remarkable properties. In Alexandrian alchemy it was used to affect a spectacle of transformation. Specifically, by crushing and heating a piece of cinnabar ore, a metallic vapor was released. This vapor could then be distilled to yield quicksilver. Reheating the quicksilver transformed it into a red-like crystal, reminiscent of the original cinnabar ore. In effect, it portrayed a transformation mystery whereby a piece of earthly matter could undergo a “tortuous ordeal of purification and renewal.” In the animistic worldview of archaic alchemy, it illustrated the idea of a spirit “captured in matter” that could be released and transformed through alchemical operations.

The alchemists also noted the highly reactive and transformative nature of quicksilver. It combined readily with substances such as sulfur, gold, silver, copper, and tin. In particular, it reacted powerfully with sulfur, to the extent that some of the Arabian alchemical systems were even referred to as the Mercury-Sulfur systems (not unlike the Chinese concept of Yin-Yang).

The concept of mercury, in alchemy, was also not restricted to the literal substance of quicksilver. For example, the alchemist Newton writes of any metal in its fluid form as being the “mercury of the metals.” In this view, the elements can be reduced through heating into a primal matter. Through appropriate operations, this primal matter would then be reconstituted, in a quest to achieve a more “noble” state.

In the alchemical worldview, each metal also has a range of “magical associations.” In this schema, quicksilver associates to the fast-moving and erratic planet mercury. Not surprisingly, it has been associated preeminently to a trickster-like psychopomp as intermediary between the realms of day and night (symbolically, between consciousness and the unconscious).

Jung and the Alchemical Mercurius

For Jung the chthonic spirit, referred to in medieval alchemy as Mercurius, was a central concern.

This figure had a profound influence on his personal and intellectual life. For example, in his personal life while preparing lectures on this figure in 1942, he emotively writes of being “dissolved almost.”

During his presentation on this figure, he expressed exasperation in attempting an articulation. He dramatically complained that “the concept swells dangerously” and “the end is nowhere in sight.” In this lecture he also described Mercurius as “ambiguous, dark, paradoxical, and thoroughly pagan” and as a “symbol... compensatory to Christ.” Not surprisingly, he also associated the alchemical Mercurius to the figure of Merlin.

Jung also represented this figure in stone carvings at his Bollingen retreat. On one of the stone walls, he created a trickster face and accompanied this by the astrological glyph of the symbol for mercury. This particular image was done while he was working on the concept of synchronicity. This same glyph also appears centrally, carved in his enigmatic Bollingen stone.

Al-Ghaib: The Invisible/Unknowable

El-Sayed El-Aswad

Department of Sociology, United Arab Emirates University, Al-Ain, United Arab Emirates
Bloomfield Hills, MI, USA

The Arabic word, *al-ghaib*, is composed of the definitive article *al* and the root *gh-ai-b* indicating what is simultaneously absent, unknowable, and invisible. There are extensive orthodox exegeses of *al-ghaib* made by the “*ulama* or religious scholars (Sha‘rāwī 1998; al-Jilani 1992) that go beyond the scope of this study which focuses on ordinary Muslims” views and daily lives. For the past 30 years, the concept of *al-ghaib* has been introduced and discussed within the anthropology of Islam and Middle East by El-Sayed El-Aswad (1987, 1988, 1994, 2001, 2002, 2003, 2005, 2006, 2010a, b, 2012, 2015). These inquiries assert that the concept of *al-ghaib* rises above any specific Muslim sect and is associated with overarching Muslim worldviews. The point of departure here is that his article aims to address the relationship between religion (Islam) and psychology by focusing on the concept of *al-ghaib* (the invisible and unknowable) as conceived and enacted by Muslims.

What makes *al-ghaib* a dominant theme in Islam is the fact that it is essentially a religiously grounded concept that refers to the belief in Allah, the angels, holy books, prophets, and unseen entities and forces as well as to such notions as livelihood, the hereafter and predestination. This religious meaning, impacting Muslims’ psychological conditions and states of mind, is a fundamental factor in accentuating the concept of *al-ghaib* especially when it is applied to non-religious spheres. For instance, *al-ghaib* is embedded in Muslims’ everyday discourses and

actions as well as in their dream visions and the interpretation of dreams.

There are two kinds of *al-ghaib*. The first kind is the absolute *ghaib* that relates, for instance, to such ultimate events as the end of the world, the resurrection, and the nature of souls or spirits. Second is the relative *ghaib*, bestowed by God on prophets and revered people (*walīs*), especially when foretelling certain matters related to past and future events. *Al-ghaib* connotes different meanings in different contexts. It can denote what is absent, invisible, imperceptible, covered, veiled, concealed, internal, and hidden. It can also refer to unforeseen future events as well as to divine knowledge (*‘ilm ladunī*) imparted by Allah through illumination (El-Aswad 2012).

Ontologically, the universe is viewed by Muslims as a place of two inseparable worlds: the visible world (*‘ālam ash-shahādah*) and the invisible world (*‘ālam al-ghaib*). Relationally, the invisible world encompasses other worlds, namely, the world of spirits (*‘ālam ar-rūḥ*), the world of angels (*‘ālam al-malā’ika*), the world of ghosts and jinn (*‘ālam al-jinn*), and the other world (*dār al-ākhirah*) including the eschatology (*‘ālam al-barzakh*) and the Day of Judgment (*yaum al-qiyāmah*). The *barzakh* mediates between this world and the other world. Moreover, Muslims believe that what is invisible, unseen, concealed, and imperceptible in this worldly life will become visible and perceptible in the afterlife – nothing will be hidden, invisible, or secret (El-Aswad 2002).

Modes of Knowledge

The visible and invisible worlds entail two kinds of knowledge. One is associated with the knowledge of the physical world of everyday observation and directly related to the common senses and to the experiential, mundane activities concerning what is apparent, visible, and measurable; the other is associated with knowledge of the spiritual and inner esoteric realms of the unseen world. The concept of *ghaib* transcends the common senses and is loaded with psychological, metaphysical, and mystical connotations implying benevolent

and malevolent dimensions. The benevolent aspect, for example, is represented by the inner effort to obtain mystical experience and knowledge of spiritual mysteries that is emphasized by Sufism as well as by Shi'ism. The Sufis mediate between the visible and spirit worlds, a role that shapes their sensibilities and religious imagination. Sufi adherents are aware that secrets of the unseen (*asrār al-ghaib*) are beyond their capacities, but never stop aspiring to gather a glimpse of them either through self-efforts (*mujāhda*) and meditation (*ta'mmul*) or through the mediation (*wisāta*) of their patron (*shaikh*). The malevolent side of the unseen sphere is represented in beliefs concerning evil spirits and their attack on people leading to spirit-possession or severe illness as well as in magicians' manipulation of malicious beings such as devils and jinn and other forces for harming people. This type of knowledge belongs to the realm of magic. Both unseen benevolent and malevolent forces are referred to by Muslims as mysteries, or *ghaibiyāt*, a word derived from the Arabic root of *ghaib* (El-Aswad 2002, 2006, 2012).

A significant religious part of *al-ghaib* relates to Muslims' belief that the Qur'an was orally revealed by God to the Prophet Muhammad, through the archangel Jibril (Gabriel), as well as to their belief in the Nocturnal Journey and Ascent of the Prophet (*al-Isrā' wa al-mi'rāj*) in which the Prophet mounted a radiant-flying creature (*al-burāq*) and miraculously traveled from al-Masjid al-Ḥarām, the sacred mosque in Mecca, to the Al-Aqsa Mosque, the farthest mosque in Jerusalem, where he led all prophets in collective prayer. Then, accompanied by the archangel Jibril, he ascended to the highest point of the seventh heaven, passing through all the heavens, and then turned back to his place in Mecca. Only the Prophet was allowed to reach this highest point known as *Sidrat al-Muntaha*, close to the Gardens of the Abode (*Jannat al-ma'wa*). During this heavenly journey, God assigned the five daily prayers to all Muslims. Suspending the natural laws of time and space, the Prophet's miraculous travel from Mecca to Jerusalem and back, spatially horizontal in nature, linked the two sacred places, while his ascension

to the heaven, spatially vertical, mediated between the natural and celestial worlds (El-Aswad 2012).

Revered persons known as "friends of God" (*awliyā' Allah*, Sing. *walīy*) are believed to be able to decode certain signs coming from the unseen world. In the hidden dimensions of reality, it is the holy persons' closeness to Allah that gives them the power to do wonders (*karāmāt*) and extraordinary deeds. Al-Khiḍr, the evergreen but invisible Walīy, believed to be alive and attentive to whoever mentions his name, is known as the "Pious Slave" (*al-'abd aṣ-ṣāliḥ*), upon whom Allah has bestowed divine mercy (*raḥma*) and divine knowledge (*'ilm ladunnī*) and who met the prophet Moses and explained to him, through three exemplary events, the unseen but real dimensions of life. The underlying message of this narrative is that besides the commonsense knowledge that depends on the logic of daily experience and observation, there is the spiritual, hidden knowledge guided by inner insight and revelation. Another holy figure, believed to be alive though unseen due to his disappearance or occultation (*ghaiba*), is the Mahdi or Awaited Imam (*al-Mahdi al-Muntazar*). Both Sunni and Shi'a Muslims believe that the Mahdi will appear before Jesus, the Redeemer, who will restore justice immediately before the apocalypse and the Day of Resurrection or Judgment (El-Aswad 2012).

Psychology and Spiritual Mediums

Though the invisible world is imaginary and imperceptible, it is thought to be real and have its own existence that can be traced to certain clues given in dreams as well as to what is known in parapsychology as extrasensory perception or a sixth sense, including precognition, clairvoyance, and the perception of information about future events or about things in remote locations that goes beyond common physical sense (McMoneagle 2015). According to Muslim worldviews, sleep is considered a partial or minor death belonging to the invisible realm. Muslims regularly talk about dreams as significant aspects of concern for them. They speak of

seeing (*ra'a* or *shāf*) a dream or of being visited by a being (person or supernatural entity) in the dream. Also, they speak of a caller (*hātif*) that might be a spirit, a ghost, or a person. It is worth noting that some Muslim intellectuals elucidate the Qur'anic verse (42:51), "No human being can communicate with Allah except through inspiration, or from behind a veil," by suggesting the word "veil" which connotes "dream" (al-'Asqalani 1959, p. 354).

Muslims differentiate between two kinds of dreams, mainly the dream vision (*ru'yā*) and regular dream (*manām* or *hulm*, pl. *ahlām*). Dream visions, viewed as mirrors of the unseen and as real as perceptions, are sharper, stronger, more veracious, and higher in dignity than regular dreams. Though some regular dreams might be contested, dream visions are never doubted. Muslims view dream visions as related to the activity of a person's soul (*rūh*), while the self (*nafs*) or psyche, inseparable from the body, is the interior agency in regular dreams that serve as symbolic ways for expressing individuals' hidden emotions and ideas as well as satisfying their needs. The essential contention here is that as the *barzakh* (eschatology) in Muslim cosmology bridges this world with the other world, dreams constitute the *barzakh* or medium linking the seen with the unseen (el-Aswad 2010a). One should not confuse dream vision with revelation (*wahy*) based on the convention that the dream vision, according to Abu Hamid al-Ghazālī (1979), equals one forty-sixth of revelation. Revelation, as is understood from the Qur'an and Ḥadīth (the tradition of the Prophet) relates to God. "Verily this is a Revelation from the Lord of the Worlds" (Qur'an, 26:192).

Livelihood (*al-rizq*)

Muslims in various countries are concerned with the notion of social, economic, and divine cover (*as-satr*) as related to the scheme of the cosmological paradigm of livelihood (*al-rizq*) or source of revenue, which belongs to *al-ghaib* and

through which the occurrences of unexpected fortunes can be explained. *Al-ghaib* allows for possibility and renders the whole universe a dynamic structure. This explains Muslims' dynamic, open, and flexible worldview and attitude of alertness for any possible event, peculiar or normal, to occur. The belief in the divine realm of *al-ghaib* brings about an imaginary world of possibilities generating hope in a good life as well as breeding high expectations for a prosperous future impacting Muslims' well-being. The faithful's belief in the predestination that belongs to *al-ghaib* may reduce anxieties caused by uncontrollable stressors. It is not uncommon to hear a Muslim say, "this matter belongs to the realm of the unknown" (*fī 'ilm al-ghaib*), to express her/his belief that the continuity of his economic resources is determined by a higher power or God (El-Aswad 2012). One argues here that heavenly or divine coverage or shelter might not have a place in the paradigm of globalism and secularism, but it occupies a central position in the Muslim culture.

Allah, The Concept of

Naji Abi-Hashem
Seattle, WA, USA
Beirut, Lebanon

Introduction

The word *Allah* is basically the equivalent of the word *God* in the Arabic language. It is not an exclusively Islamic or Christian or Jewish term, but rather a Semitic label and name. Actually, the translation of the biblical scriptures into Arabic mainly uses the word *el-Rab* for the “Lord” and the word *Allah* for “God.” The first sentence of the book of Genesis, for example, reads as the following: *Feel Badʿee Khalaka Allahu el-Samawatti wa el-Ard* – “In the beginning God created the heavens and the earth” (Genesis 1.1). And the opening of the Gospel of John says, “In the beginning was the Word, and the Word was with God, and the Word was God (*Allah in Arabic*)” (John 1.1). The expression *Allahu Akbar* (God is Greater) is a common Islamic phrase, repeated frequently by practicing Muslims in daily life and especially in the call to prayer. It emphasizes the greatness and transcendence of God and is generally referred to as *al-takbeer* – meaning the act of ascribing greatness. Similarly, the *Fatiha* is used in the Islamic tradition as an opening citation or invocation, *Bismil Laahi el-Rahmaan el-Raheem*, meaning in the Name of God, the most Gracious, the most Merciful (Religion Facts 2016).

Therefore, Allah in Arabic is simply the synonym of the official title/name of God in other languages. However, it is important to stress here that the concept of God, the practice of faith, and the worship of the Divine vary considerably among believing communities, religious traditions, social norms, cultural heritages, and spiritual practices (Fig. 1).

The Middle East region has given birth to three major religious thoughts and cultures: Judaism, Christianity, and Islam. In many ways, their

Allah, The Concept of, Fig. 1 The name “Allah” in Arabic. Public domain (<http://commons.wikimedia.org/wiki/File:Allah.svg>)

language and worldview are closely related (Abi-Hashem 2011b, 2013b). Monotheism strongly believes that the creator of life, the organizing principle, and the ultimate reality in the whole existence is *God*. Traditional theism holds that there is a transcendent spiritual realm, that God is the creator of heaven and earth, and that all universes are under God’s divine providence, guidance, and sovereignty. All three traditions prohibit anthropomorphic visual images of the divinity, but rather consider Deity as beyond humanity or precise image-making (Barrett and Keil 1996), although a few symbols or portraits persist in observing rituals and offering prayers, as in oral-verbal traditions, in order to assist worshippers in conceptualizing theological abstracts in a personal and tangible way (Abi-Hashem and Driscoll 2013; Barrett 2008; Bowker 1973; Dombrowski 2016; Spero 1992; Wainwright 2009).

It is interesting how people learn from early childhood to address and describe the personality of God, as a heavenly parent, and the personality of their father and mother, as earthly parents, in correspondent terms and comparative ways (Justice and Lambert 1986; McDonald et al. 2005; Streib and Hood 2016). Likewise, the process of mental-emotional attachment to God is

usually facilitated or hindered by the psychological attachment to a human parent figure or an adult caregiver (Bonab et al. 2013; Fowler 1995; Worthington 1989).

Linguistic Roots

Formally pronounced “Allaahh,” the term is probably a derivative of Al-Ilaah, meaning the Lord or the Supreme Divine. So it has roots in the Hebrew tradition where *Elohim* is the plural title for God. This was formed early in time after the transition from polytheistic and subcultures into monotheistic mentalities. It may also have roots in Aramaic as *Elaha* and in Syriac as *Alaha*. Interestingly, *Allah* is never used in plural and has no parallel in the English language; therefore, many manuscripts retain its Arabic form in the translated scriptures and other sacred texts (cf. Warren 1998).

Allah is a *name* and a *label* at the same time. It is the act of calling God as the supernatural deity and referring to God as the one only Lord, with faith and acknowledgment to his existence and role. With the increased exposure to Middle Eastern societies and Islamic worldviews in recent years, many people in the West have been wondering whether *Allah* in Islam is the same as *God* in Christianity. Several debates have been held, and books have been written on this subject to the extent that, in some quarters, it has become a hype and an inflammatory debate. Some people (including converts from non-Christian backgrounds) totally refuse to use the word Allah in their vocabulary as they insist it is exclusively an Islamic term that has nothing to do with Christianity.

The question remains: Are the words *God* in English and *Allah* in Arabic the same? The global answer is simply yes! This is not a matter of *pure doctrine* or *systematic theology* but rather a mere variation of the same title or noun in two different languages. The terms are semantically compatible especially when a transition or a translation occurs from one language to another. Therefore, it is a matter of comparative terminologies and religious understanding and is not the case of identical

ideologies or proper theologies. All theistic faiths address God in different titles, labels, terms, and connotations. Each religious tradition or belief system has a rich vocabulary to describe and refer to the supreme creator. For example, Muslims can address Allah in about 99 different words, adjectives, and terminologies (Stade 1970). Eventually, while the attributes and titles are plentiful, the attempts to genuinely and comprehensively understand the nature of God, reverently and worshipfully relate to the personhood of God, and diligently and faithfully serve the teaching of God, as the Most High Being, are innately very similar and compatible across monotheism (cf. Meek 1960; Paloutzian 2017; Tillich 1959; Ullah 1984; Wainwright 2009).

Now that is being said, it is important to also note and stress here that the fact that how people psychologically conceptualize God, spiritually theologize God, and tangibly worship God is quite different among each other. That is even true within each particular tradition or community of faith. It all depends on how their sacred texts describe and reveal the idea and image of Allah-God and on how each group understands the nature, function, property, trait, person, and role of their Deity (Grabmeier 2015). It also depends on how both lay believers and theological scholars interpret their own historical backgrounds, sacred scriptures, sociocultural norms, mental-emotional conditions, and psycho-spiritual needs, alone as collection of individuals or together as communities of faith. Developmentally speaking, individuals change their perception of, relationship with, and conception of God as they grow older, change life direction, mature emotionally and spiritually, or move along the various sociocultural stages of life (Abi-Hashem 2011a, 2013a, 2015; Abi-Hashem and Driscoll 2013; Armstrong 1993; Bowker 1973; Fowler 1995; Hoffman n.d.; Tillich 1959; Ullah 1984; Worthington 1989).

Internalizing the God Concept

The internalization of God-Allah concept is closely related to the concept of *Imago Dei*, which separates humans from other living

creatures or species and grants them a special privilege within the world and broader universe. Therefore, God becomes more than a static entity or an abstract notion. To a human being, God becomes an interactive presence, a supernatural agent, and a dynamic reality with intrinsic-extrinsic qualities and clear mental, emotional, and social implications.

Some people perceive God-Allah to be mainly accepting, merciful, compassionate, graceful, and forgiving. Others perceive God-Allah to be demanding, lawful, truthful, judgmental, and critical. Those qualities and perceptions, in turn, shape the individual's or the group's expectations and reflect on their behaviors, attitudes, relationships, actions, and worldviews (cf. Johnson et al. 2013). These functions and dynamics are normally amplified by the person's background experiences, mental reasoning, emotional tone, psychological needs, and sociocultural heritage. In a more specific way, it all depends on whether people are more linear or circular in their thinking, impulsive or even in their temperament, accommodating or aggressive in their relational style, had a positive or negative parent/father figure, possess a black and white mentality, were raised in a moderate or indoctrinated environment, can tolerate gray areas and ambiguity, are able to constructively resolve the developmental identity crises, or regard faith as part of the problem or part of the solution in their lives.

It appears that there is a correlation between the concept of God and the establishment of inner peace and spiritual healing. Many theorists have linked the increase of personal faith and spiritual well-being to a balanced and a healthy view of God (Linendoll 2001). In addition, trained psychotherapists and pastoral counselors often are engaged in the process of restoring and repairing the negative views of self, God, others, or world-life itself that clients, students, and patients struggle with along their journey, due to distortions, misconceptions, disappointments, deep hurt, or damaging psychological experiences (Aten et al. 2012; Graham and Graham 2011; Seamands 2015; Sham 2015; Worthington 1989).

Some analysts differentiate between the *image* and the *concept* of God-Allah. They bind God

image to object relations or psychodynamic theory and God concept to neurocognitive sciences or cognitive therapy. To our human mind and psyche, the entity of God is an ontological reality unto which we ascribe anthropomorphic characteristics. This is an attempt to comprehend the vast reality of God and make the divine image closer and similar to ourselves. Some thinkers argue that God concepts must comprise both naturalistic and non-naturalistic properties. Virtually, such processes tend to be regulated by a host of psycho-spiritual factors and sociocultural mediators (Brokaw and Edwards 1994; Dombrowski 2016; Davis et al. 2013; Hoffman n.d.; Lawrence 1997; Odwazny-Peterson 2005; Piedmont and Muller 2006).

For example, Francis et al. (2012) tested a theory concerning the linkage between God images and individual differences in young people as related to the practice of *empathy*. The authors found that religious affiliation and religious attendance were less important than the God images, which people hold privately. The God of mercy was associated with higher empathy, while the God of justice was associated with lower empathy, as manifested in daily activity and relationships.

Both Quranic and biblical psychologies (Ilm el Nephiss el Kitaabi) highlight the significance of the Divine imprints in all humans. Though they use different terminologies, connotations, and explanations at times (soul, mind, spirit, psyche), the underlying principle is basically the same: human beings have the ability to act rationally and relationally, introspect and self-analyze, enjoy responsible free will, experience wide range of emotions, think about thinking (metacognition), and venture on a spiritual quest toward the ultimate being, Allah-God. Some non-Arabic speaking Muslims learn to recite verses and say prayers in the original Arabic form. Some of them even learn to read the Quran in Arabic. However, all Muslims believe that the Quran was fully inspired and written in the highest style of the Arabic language, reflecting a spiritual dialect and, as they claim, a heavenly language as its original source (cf. Bonab and Koohsar 2011).

According to some experts in the cognitive science of religion, in order to internalize the

God concept successfully, a number of features must be included, like intuition and counterintuition, global intentional agencies, operational knowledge and wisdom, powerful interventions in the physical world, and ability to inspire the mind and motivate the attitudes as well as the behaviors. Certainly, our core beliefs about the reality of God-Allah and the nature of the Divine-Agent have significant ramifications on our mental-emotional health and interpersonal-social interactions, during both the pleasant and the unpleasant seasons of life, especially during times of profound need, severe crisis, tragedy, and death (cf. Barrett 2015; Horst 2013).

Misreading and Misconception

Historically, there have been two areas of tension around the concept of God-Allah among the world's major religious ideologies. The first one is a religio-spiritual tension – Is God Yahweh-Elohim in Judaism the same as the Triune Personal God in Christianity or the same as Allah el-Ahadd (*the strictly singular God*) in Islam? How about the manifestations of the Divine in Hinduism and Buddhism? And smaller religious traditions? Actually, with the many branches of each religious thought and movements, the contrast and distinction of the nature, person, and role of God-Deity become even sharper and more confusing.

Several groups have frequently accused each other of being theologically inaccurate, mixing truth with error, or accommodating heresy. However, larger and moderate groups have constantly reached out to each other and established friendly encounters and interfaith dialogues. In fact, and through the ages, people of various religious backgrounds have lived and worked together, married to each other, celebrated life stages together, and created nicely bonded communities. Only skewed, legalistic, and fundamentalist groups have isolated themselves or caused troubles and schisms among others.

The second area of tension is sociopolitical – How individuals and groups understand their

ethno-political affiliation, articulate their ideology and worldview, or fight for their causes and rights depend on their underlying structures, emotional needs, and personality preferences. Often a doctrinal cover or a religious profile is used to justify social actions, uprising movements, and even armed conflicts. That will greatly appeal to the faithful masses of believers.

Thus, theological themes can be used to conceal sociopolitical agendas, and a polished godly rhetoric can be used to justify doctrinal politics. However, the more serious scenario takes place when someone, or some group/agency/nation, executes an attack mission (or act of war) involving destruction, harm, and devastation because they believe that is their mandate from God-Allah, as part of their mental schema and conviction. This represents the ultimate distortion and abuse of power, when aggression, violence, trauma, and atrocity are committed in good conscience, due to a sense of entitlement or under the influence of indoctrination. Smaller radical movements interpret the Divine Will in skewed ways so to give themselves permission to kill others, who belong to the opposing camps – and, at times, they die, sacrificing themselves in the process, believing to achieve the privilege of martyrdom and to gain the ultimate prize of reaching paradise, as their final destination (cf. Abi-Hashem 2014).

Thankfully, many moderate voices and reasonable intellectuals everywhere are raising public awareness and calling for an early detection of the symptoms of rigidity, legalism, indoctrination, and fundamentalism. They are succeeding in defusing fanatic views and skewed hermeneutics of the various sacred texts and religious teachings, especially the unclear and questionable ones. Eventually, they are projecting real Good Will within and among the major denominations and, therefore, helping repair the damage caused by fanaticism, and, therefore, they are gradually preventing the abuse of religious themes, faiths, texts, practices, and values by the radicals and the zealous extremists (Abi-Hashem 2011b, 2013b, 2014; Santosh 2004).

Everyday Use of Allah

In many warm cultures, the casual use of the term and name of *Allah* is very popular. It is frequently used as part of the interaction repertoire and communication skills, like in personal greetings and social exchanges. It also occurs in public speeches and political discourses, especially during any significant event or ceremony. The mention of God-Allah is associated with a wide range of expressions conveying safety, blessing, health, strength, comfort, protection, best wishes, and prosperity (cf. Abi-Hashem 2008, 2011b; Nydell 2012).

In public life, high-ranking officials freely mention God-Allah. It is not unusual to hear that as well in business, politics, academia, and other circles. For example, in some society in the Middle East, the mention of God is actually expected, both in formal and informal settings. The sharp division between what is secular (state/civil/society) and what is sacred (religious/church/spirituality) does not actually exist.

Some of the expressions commonly used in Arabic are as follows. *Allah Maak* (God be with you) is a form of a salutation as well as a wishful prayer for divine company before taking off on a journey or simply when saying goodbye after visiting together. *Inshallah* (God willing or as God wills) is mentioned when people are planning, agreeing, or hoping for future events. *El-Hamdallah* (thanks be to God) is a common response for personal inquiries like “how are you?” “how is your family?” “how is your health?” or “how was your trip?” *Masha Allah* (how wonderful, marvelous) implies fascination with what God has created, done, brought about, or bestowed on others. These include a newborn baby, a new house, a recognition-honor, a grown young adult, or a major accomplishment. It is used to acknowledge a new establishment, as part of exclamation remarks and pleasant exchanges. In more Islamic societies, this longer greeting is often used: *Alsalaamu Aleykum wa Rahmatu Allah wa Barakatu* (Peace be upon you with God’s mercy and blessings).

In conclusion, the word *Allah* has both a theological connotation and an everyday practical

application. It is rather unique in its roots and heritage, yet it has many parallel words and titles in several old or new languages. Though it refers to the same theistic Divine Reality and Supernatural Being, as a creator and sustainer of life, its concept, interpretation, function, expectation, and implication for areas related to life, service, doctrine, worship, culture, relationships, and well-being vary considerably among the communities of faith and their local societies.

Allport, Gordon

Ralph Hood

Department of Psychology, University of
Tennessee, Chattanooga, TN, USA

Gordon Allport (1897–1967) was widely recognized as a major contributor to the emerging discipline of psychology in the United States during many of its formative years, in which the scientific status of psychology was widely debated and challenged. Our focus in this brief biographical study will be to employ Allport's own reflections of himself as a "maverick" (Allport 1967a, p. 9) both in his view of the proper object of study for psychology and of appropriate methods of investigation. His contrarian nature is evident in his refusal to adopt a psychology congruent with the more narrowly defined experimental interests of what was emerging as mainstream American psychology conceived as a natural science.

Life and Career

Gordon Allport was one of four sons born to a country doctor, John Edwards, and to a pious Free Methodist mother, Nettle Wise. He was born in Montezuma, Indiana, but the Allport family soon moved to Glennville, a suburb of Cleveland, Ohio. While Gordon was the youngest of four boys, he was most heavily influenced by the second eldest son, Floyd, 7 years his senior, whose career in psychology mirrored Gordon's, only insofar as Gordon would rebel from the experimentally based positivism championed by Floyd and mainstream American psychology.

Allport's biography is inexorably linked to Harvard University's effort to define psychology in positivist terms. Entering Harvard in 1915, Gordon studied social ethics and psychology. Gordon took Hugo Münsterberg for experimental psychology while his brother, Floyd, was a doctoral student of Münsterberg's and an instructor in the course. The influence of Münsterberg and his brother was to raise serious doubts in Allport's

mind as to the methodological propriety of an exclusive focus upon experimental methods in approaching psychology as a scientific discipline. Sixty years later, obviously unpersuaded by the experimental psychology taught him as undergraduate at Harvard, Gordon noted that elevating the laboratory-based experiment to the gold standard in psychology had obvious limitations.

Even if the experiment is successfully repeated there is no proof that the discovery has wider validity. It is for this reason that some current investigations seem to end up in elegantly polished triviality – snippets of empiricism, but nothing more (Allport 1985, p. 68).

In 1919 Gordon graduated from Harvard, the same year his brother obtained his doctorate. He accepted a 3-year appointment in Constantinople, Turkey, at a Christian school, Robert College, where with the primary responsibility for teaching English, although he taught sociology as well. At his brother's urging, Gordon applied for and received a fellowship for graduate psychology at Harvard. He petitioned but was denied the right to delay acceptance of the fellowship. He thus decided to leave Robert College, fulfilling only 1 year of the 3-year contract. These circumstances led to a confrontation with Freud widely commented upon by both Allport himself (Allport 1967a, p. 8) and his major biographer (Nicholson 2003, pp. 68–70).

Gordon's youngest brother, Fayette, was serving on the US Trade Commission in Vienna. Gordon decided to visit him before his return to Harvard. Knowing that Sigmund Freud also resided in Vienna, Gordon requested a meeting with him and received a positive response in writing. Upon meeting with him Allport was shown Freud's office and then the meeting slid into an awkward silence as the two sat facing each other. Attempting to initiate a conversation, Gordon told of his experience with a small boy on the train who apparently exhibited a strong dirt phobia. Instead of entering into a conversation based upon this incident, Gordon was taken aback by Freud's response: "And was that little boy you?" (Allport 1967a, p. 8).

This experience, like that of Münsterberg's efforts to persuade Gordon of the merits of

experimental methods, solidified another of Gordon's contrary views. Freud's comment persuaded Gordon that psychologists would do well to explore and give full recognition to manifest motives before probing unconscious ones – setting him in a lifelong opposition to the other major trend in American psychology, psychoanalysis (Allport 1967a, p. 8).

Arriving at Harvard's graduate program in psychology, Gordon was already convinced of the limitations both of the experimental method and of psychoanalysis. Influenced by his parents and Middle America's focus upon character, Gordon was delighted to learn that his mentor, Herbert S. Langfield, was open to alternative methodologies. Gordon's doctoral dissertation was on character scientifically approached or, in what was to become Allport's lasting contribution to psychology, the study of personality. Indeed, the major biography of Gordon Allport to date is titled appropriately, *Inventing Personality* (Nicholson 2003).

Upon obtaining his doctorate, Allport applied for and received a Sheldon Traveling Scholarship when he spent 1 year studying in Germany and 1 year studying in the United Kingdom at Cambridge University. Each of these years solidified Allport's contrarian ways in that he became convinced that psychological study of persons was both important and could not be adequately approached by the theories and methods that characterized mainstream psychology. He became committed to the individual person as ontologically fundamental for psychology. He returned to Harvard in 1924, having accepted a lectureship in social ethics. He taught what many consider the first course in personality at any American university. He was also laying the foundation for what was to become the first textbook in personality, *Personality: A Psychological Interpretation* (Allport 1937) which was thoroughly updated as *Pattern and Growth in Personality* (Allport 1967b), published in the year of his death.

Allport's contrarian views led him to sense he had no future in the Harvard psychology department, dominated by positivism and experimentalism. He thus accepted an appointment at Dartmouth College in 1926 where he taught

introductory, social, and personality psychology. However, as his reputation in the newly established field of personality grew, Harvard enticed him back. In 1930 he left Dartmouth for Harvard, where he completed his career.

Gordon Allport's return to Harvard exposed the success of his contrarian views. Harvard psychology, dominated by the positivist experimental psychology of Münsterberg, was followed by William McDougall's instinctive psychology. Nationally psychology at Harvard was diminishing in reputation in the face of the acceptance of more personality-oriented interests championed by Gordon Allport. Deciding to seek an American psychologist, to give students exposure to the emerging field of personality, Harvard made an offer to Gordon Allport for a tenure track position. Gordon was as an admittedly compromise choice after Harvard decided, in the words of E.G. Boring who chaired the search committee, "to give up trying for the great" (quoted in Nicholson 2003, p. 167). Allport returned to Harvard with assurances that his contrarian views would be respected. In what is perhaps an ironic Oedipal twist, Gordon Allport triumphed over the psychologies of both Freud and Münsterberg. He went on to chair the department from 1936 to 1946. In 1946 he cofounded the Department of Social Relations at Harvard, a triumph for his contrarian views. This newly formed department was committed to an eclectic, contrarian view that the scientific study of persons could be achieved by anyone trained in "sociology, anthropology, statistics, or some other discipline" (Allport 1967a, p. 19). The department eventually was disbanded in 1972, due in Allport's view to the inability to develop a common basic language for the department's interests (Allport 1967a, p. 19). Perhaps this can be cited as Gordon Allport's major failure to establish his contrarian views. However, his successes overshadowed this one failure. He was President of the American Psychological Association (1939) and of the Society for the Psychological Study of Social Issues (1944), a group which anticipated and continues interest similar to the Harvard's Department of Social Relations. Likely the most prestigious award Gordon Allport

received was the Distinguished Scientific Contribution Award of the American Psychological Association just 3 years before his death.

Allport's Lasting Contrarian Contributions

If Harvard settled for hiring Gordon Allport after a concession to abandon the search for the great as noted above, Allport's reputation, while high, perhaps can also be seen as not great. Among personality psychologists he is overshadowed by Freud and even among those who hold the organism as ontologically fundamental, he is overshadowed by behaviorists such as B.F. Skinner and J. B. Watson. Still, Allport's reputation is strong but it is less strong than it might otherwise be simply because so many of his contrarian views have become normative in American psychology whose fragmentation is great enough to disallow any one framing of psychology to have total dominance. Here, we will cite five of Allport's lasting contrarian views, each successfully entrenched in one fragment in the mosaic that is contemporary American psychology.

First, personality psychology is firmly established as an area of specialization that, despite its methodological, statistical, and psychodynamic varieties, cannot be reduced to any one of these. Indeed, Allport can be seen as both the father and critic of modern trait theories such as the five factor model (John and Robins 1993). He is father of accepting the identification of basic traits as essential to the study of personality, but he is critic in being suspicious of the sophisticated statistical treatment of data in what can be seen as a pseudo-objectification in an effort to minimize intuition in the study of persons.

Second, Allport's insistence that motives can be assessed in the terms of their contemporaneous functioning, irrespective of their historical origin, has largely counted for the demise of the dominance of excessively psychodynamic views of unconscious motivation. The exploration of manifest motives (Allport's response to Freud) and the exploration of personality traits outside of the laboratory context (Allport's response to

Münsterberg) are well established. Allport's insistence that motives can become functionally autonomous (Allport 1966) is a lasting contribution to the dynamic nature of personality that unlike psychoanalysis emphasizes conscious strivings and intentional motivations.

Third, Allport's endorsement of alternative methodologies is nowhere better expressed than his insistence of the study of single cases. Opposing nomothetic data (based upon group average) to idiothetic (ideographic) data (based upon a single person) contrasts positivistic scientific methods that focus upon statistical evaluation of experimental data with humanist methods that seek to understand persons in terms of the meaningfulness of their lives, assuring that psychology as home in the humanities as in the sciences (see Hood et al. 2009, pp. 483–484). Late in his life, Allport published *Letters from Jenny* (Allport 1965) an extensive analysis of a series of letter from a single person, long used by Gordon as a basis for course lectures.

Fourth, Allport produced classic texts focused upon a single issue illuminated from a variety of perspectives. Perhaps no text illustrates Allport's contrarian views better than *The Nature of Prejudice* (Allport 1954). It is hard to classify this book as merely psychology, sociology, anthropology, clinical psychology, or any other singular discipline. It brings to bear all that the social sciences can muster to explore a phenomenon of central importance to society in the terms of the contrarian goals both of the department of Social Relations and of the Society for the Study of Social issues (both chaired by Allport).

Finally, a major contribution totally ignored by some of Allport's biographers (e.g., Nicholson 2003) is Allport's concern with religion. *The Individual and His Religion* (Allport 1950) is arguably next to William James's *Varieties of Religious Experience* (1902–1985) the most influential text in the resurgence of the American Psychology of religion that began in the 1960s. Ironically, like his trait theory, his distinction between intrinsic and extrinsic motivations for religious activities led to over decades of exclusively measurement-based studies that Allport would only reluctantly applaud (Hood 1998).

A massive empirical literature emerged based upon Allport's distinction between motivations for being religious. Allport famously distinguished differences between extrinsic motivation (in which an individual *uses* his or her religion) and intrinsic motivation (in which an individual *lives* his or her religion). The distinction between different motives for being religious highlighted for Allport both the negative qualities of religion, largely associated with extrinsic motivation, and the positive qualities of religion, largely associated with intrinsic motivation. Linking his study of religion to his study of prejudice allowed Allport to explore how religion both produces prejudice when extrinsically motivated and reduces prejudice when intrinsically motivated (Hood et al. 2009, pp. 404–426).

That psychology should study intrinsically motivated religion as one value in which mature personalities can achieve a meaningful integration is something that Allport would more than simply approve. It is associated with some of his earliest publications in psychology (Allport and Vernon 1933). While religion is but one unifying philosophy of life, Allport believed intrinsically motivated religion was a major exemplar of the way in which a mature personality could be fully realized. Religion also affirmed Allport's non-reductive approach to the person as ontologically fundamental. This is perhaps his most strongly held contrarian view and is what led him justify his concern with his lifelong study of personality at Harvard with the simple phrase, "I am the departmental mystic" (Nicholson 2003, p. 183).

Amaterasu

David A. Leeming

University of Connecticut, Storrs, CT, USA

Blanton-Peale Institute, New York, NY, USA

Amaterasu Omikami, the Japanese Goddess of the Sun, is one of the rare cases of a female sun deity (the Maori and Cherokee goddesses are others). She is the queen of all the Shinto *kami*, the gods and animistic spirits. The daughter of the Japanese creators, Izanami and Izanagi, she is said to be the direct ancestor of Japanese Emperors. It is she who provides cosmic power to her viceroy in the Land of the Rising Sun. Amaterasu is She Who Possesses Noon. Without her, rice does not grow.

She has a brother, Susanowo, who embodies the Sea and Storms.

One day Susanowo became so drunk and beligerent that he rushed through Heaven filling irrigation canals with mud and crushing the growing rice plants. He even defiled the temples of his sister Amaterasu. Horrified, Amaterasu hid herself in her cave and locked the door, thus depriving heaven and earth of her light and warmth. The spirits of the rice and other living things began to wither and die. The other gods caught Susanowo and banished him from heaven, but still Amaterasu remained in her cave. The deities gathered before the cave entrance and begged Amaterasu to come out. The world was dying in her absence. Unmoved, the Goddess remained in the cave. Knowing that the world would die without her, the gods and goddesses devised a plan. They first gathered roosters, which like to crow at dawn. Then they found an eight-armed mirror and a string of beautiful jewels which they would use later. They had the beautiful Ama no Uzame decorate her body with leaves and dressed that way she began a lascivious dance outside the cave. Eventually the beautiful dancer became so ecstatic that she tore off her clothes and danced naked, causing the other gods to laugh loudly. Then the cocks began to crow, and Amaterasu peaked her head out of the cave door to see what was happening. She saw her reflection in the eight-armed mirror, and, amazed at her own beauty, she inched her way further out of the cave, bringing light, warmth, and fertility back to the world. Later Amaterasu and Susanowo reconciled. Susanowo gave his sister a sword, Kusanagi, and Amaterasu gave the sword, the octagonal mirror, and the necklace of jewels to her grandson Ninigi, the first Japanese emperor. The sword, the mirror, and the necklace continue to be important ritual elements in ceremonies surrounding the emperor.

Scholars such as Hayao Kawai and Konoyu Nakamura see a significant connection between the Amaterasu myth and the Japanese collective psyche. In the fact that the chief kami is female they see an essential maternal and feminine aspect in that psyche, even as fifth and eighth century reconstructions of the original myths tended to be more male-oriented and patriarchal, reflecting a change in the Japanese psyche over the centuries.

The reconciliation between Amaterasu and Susanowo, however, conveys the sense of a needed balance between opposite but necessarily complementary forces, what might be called Yin and Yang, masculine and feminine, Dionysian and Apollonian, or irrational and rational, for example. The balance of these forces within both the individual and the collective psyche is essential for the achievement of psychological wholeness. As Eric Neumann and other Jungians, especially, have suggested, the Great Goddess who emerges from the mythologies of many cultures is herself an embodiment of consciousness. Societies diminish the status of their ancient goddesses in favor of her opposite at great risk to themselves. To ignore or destroy the goddess is symbolic of a willingness to avoid consciousness, and the result can only be personal or collective disintegration. Amaterasu is attracted by the crowing roosters and the dance of Ama no Aazame, and her own image in the mirror. What she confronts and accepts is the beauty which is herself. In that acceptance, she returns her world to light and warmth, and in so doing she becomes potentially each of us emerging into consciousness from the cave prison of repression and denial.

Ambrose of Milan

Dan Mills

Athens Technical College, Athens, GA, USA

Saint Aurelius Ambrose (377–397 C.E.) was Bishop of Milan from 374 C.E. until his death in 397 during a time when the Church sought to codify Christian theology in the beginnings of the Roman Empire's decline. Ambrose thus lived during a time when the ancient world of classical Rome clashed with the new monotheistic religion, and this tension appears throughout Ambrose's works. Although Christian, Ambrose had considerable familiarity with Roman authors through his training in rhetoric, and his writings demonstrate what could be considered a *transference* of intellectual tradition and history from classical Rome to the new Christian Church.

Ambrose lived during the reign of the first Christian Roman Emperor, Theodosius, who had been baptized during an illness from which he eventually recovered. As McLynn notes (1994, p. 291), Ambrose took issue with Theodosius' massacre of his own civilians at Thessalonica, although the confrontation has over the centuries become exaggerated into myth. Nevertheless, Theodosius apparently did have genuine relationship with Ambrose (McLynn 1994, p. 292), and ultimately he underwent a more sincere conversion to Christianity, which amounts to personal and psychological transference unprecedented in the ancient world.

Psychological transference refers to the shift of affection from one place to another. In the clinical setting, this may manifest as the analysand feeling affection or even love for the analyst, which ultimately means that the treatment is being successful. Freud (1998, p. 422) observes that "sexual repression makes use of transpositions from a lower to an upper part of the body." Freud (1998, p. 217) explains that for a patient "earliest experiences of childhood" are unobtainable and would be "replaced in analysis by 'transferences' and dreams." Jung (1966, p. 134) refers to Freud's

formulation of transference as the "alpha and omega" of the psychoanalytical relationship, the analysand's attempt to create a "rapport" with the analyst.

We can understand Ambrose's relationship with Augustine in this context: Augustine in essence was the analysand who attempted to connect with Ambrose yet never quite achieved a true rapport. Nevertheless, Ambrose had significant influence on Augustine. In his *Confessions*, Augustine relates that Ambrose read silently (*vox autem et lingua quiescebant*) and that he once told Augustine to read Isaiah, but Augustine did not understand the first passage. Augustine also notes that Ambrose loved his father Simplicianus greatly (*quem vere ut patrem diligebat*).

Much of Ambrose's thought followed in the tradition of Stoic philosophy's mandate for self-control and temperance. In *De virginitate* 3.5.25, Ambrose (Ramsey 1997, p. 112) writes "Joy, then, must be the product of a fully conscious mind—one that is not confused by coarse revelry and wedding tunes. For modesty is jeopardized and temptation lurks where extremes of dancing accompany pleasures. I desire the virgins of God to be removed from this" (*Debet igitur bene consciae mentis esse laetitia, non inconditis comessionibus, non nuptialibus excitata symponiis; ibi enim intuta verecundia, illecebra suspecta est, ubi comes deliciarum est extrema saltatio. Ab hac virgines Dei procul esse desidero*, trans. Ramsey). Ambrose's mandate for sublimating baser desires is characteristic of much early Christian theological debate, and precisely correlates with Freud's understanding of relocating desire from the lower part of the body to the upper part.

Ambrose's most overt exercise in philosophical transference appears in his *De Officiis Ministrorum, On the Duties of the Clergy*. In this text, Ambrose's rewriting of Cicero's *De officiis* presents a Christianization of Cicero's model of proper Roman behavior, what Davidson (2002, p. 49) refers to as a "positive synthesis of Ciceronian Stoicism and Christian ethics" and an "ambitious sort of apologetic exercise" and "pious attempt to elevate the pagan virtues by applying

them creatively to a different context.” Davidson (2002, pp. 52, 104) also notes an “overlap” of Stoicism and Christian theology in “several areas of psychology and ethics” and labels Ambrose’s *De officiis* as a “window on the psychology” of a flawed man who nevertheless made an indelible mark on the formation of the Christian Church. Contemporaneous with Davidson’s edition, Satterlee (2002, p. 225) claims that in his sermons Ambrose employs a “direct and uncritical transfer of the text” to its audience.

Davidson, the editor and translator of Ambrose’s text, has also used psychological language to describe Ambrose’s project. For instance, Davidson (1995, pp. 318–319) argues that Ambrose makes so many doubtlessly “sub-conscious” recollections of Cicero in his own *De officiis* that full attribution would require Cicero’s name “all over the page” in some places, which would further contribute to text’s reputation as lacking “originality.” Davidson (1995, p. 322) also believes that in spite of the clear and blatant influence from Cicero’s text, Ambrose nevertheless seeks to undermine ancient philosophy, which suggests Ambrose had a “desire to replace Cicero’s work rather than naively to integrate it into the ethical teaching of the church.” According to Davidson (1995, p. 315), Ambrose intended either to replace Cicero’s work or to synthesize Christian ethics with Ciceronian Stoicism.” Davidson (1995, pp. 324–325) notes that Ambrose imported “new meanings into old vocabulary,” at times “deliberately” as well as “unconsciously.”

Writing long before a complete English translation of Ambrose’s text had appeared, Gaffney (1981, p. 42) argues that both Cicero’s and Ambrose’s texts focus on “decorum” which manifests as “outward seemliness generated by interior moral wholesomeness,” with Cicero giving “advice about cultivating it” and Ambrose going into “even more detail.” Gaffney (1981, p. 42) believes that both Cicero and Ambrose seek “to canonize traditional proprieties of Roman manners,” but they do so by subscribing to “a theory of close psychosomatic connectedness between manners and morals.”

Ultimately, Gaffney (1981, p. 44) believes that Ambrose transforms “ideals of private beneficence into systems of public benefaction” through his rewriting of Cicero’s text and use of extensive “ecclesiastical organization” of the early Church.

Ambrose borrows heavily from Cicero’s mandate against submission to desires. Ambrose (2002, pp. 168, 182, 196) includes among these things that “propagate a desire” for food (*produnt cupiditatem*, my translation); individuals who “have a desire for freedom” (*habebat cupiditatem libertatis*, my translation); that which “instills a desire of learning” (*inquirendi infundit cupiditatem*, my translation); and the more significantly dangerous “desire for power” (*Potentiae... cupiditas*, my translation). Ambrose’s requirement that every congregant sublimate baser desires and passion in essence makes Ambrose the analyst of the collective Christian analysand, many of whom felt the pull of old and new, Roman and Christian, interior and exterior that ultimately would manifest as a collective and permanent transference of public consciousness from classical pagan Rome to the growing Christian Church soon to dominate Western religion, culture, and politics.

American Buddhism

Robert Kaizen Gunn

United Church of Rockville Centre, Rockville Centre, NY, USA

Current Popularity of Buddhism in the United States

Contemporary Buddhism is one of the strongest and perhaps subtlest catalysts for change in United States history, soon to equal, if not surpass, the role of both Christianity and Judaism in the shaping of American religion, philosophy, values, culture, and identity – even, perhaps, American politics and economics. It is a new *basso continuo* of change in America, finding expression not only in direct religious practices but interpenetrating both intellectual and popular culture.

Like one of its central metaphors, the diamond net of Indra, which consists of a necklace of diamonds, each of which is connected with every other diamond, is separate and yet within each diamond is every other diamond; American Buddhism consists of many highly varied *sanghas* (local groups) whose common root is in the teachings of Shakyamuni Buddha of third-century BCE India and has now interpenetrated every aspect of American culture. It is found in common images in marketing (the Dalai Lama on Apple computer); in music (e.g., Philip Glass, Buddha Bar); in movies such as *Seven Years in*

Tibet (1997, Director Jean-Jacques Annaud. The movie was based on the true story of Heinrich Harrer with the Dalai Lama from 1944 through the invasion of Tibet by China in 1951), *Kundun* (1997, Director Martin Scorsese. Based on the Dalai Lama's life from childhood to adulthood), or *Matrix* (1999, Directors Andy Wachowski and Larry Wachowski), Richard Gere; in psychology (the plethora of books on Buddhism and psychotherapy); philosophy (*The Monk and the Philosopher: a Father and Son Discuss the Meaning of Life*, 2000 by Jean-Francois Revel, Matthieu Ricard with John Canti, translator. New York: Random House); science (www.neiltheise.com, accessed 6/19/09, the Dalai Lama's *The Universe in a Single Atom*, 2006); education (Naropa Institute, the rise of departments on Buddhism in universities and seminaries); restaurants (Zen Palate); bars (Zen, West Hempstead, NY); and politics (former governor of California, Jerry Brown). Buddhist thought may be found indirectly in some of the most popular movies such as *Star Wars* (1977, a movie, Director George Lucas), *The Matrix* (1999, above), *The Lion King* (1994, a movie, Directors Roger Allers and Rob Minkoff), and *Pocahontas* (1995, a movie, Directors Mike Gabriel and Eric Goldberg).

After a growth of 170% between 1990 and 2001, according to the American Identity Survey, Buddhism has become the fourth largest religion in America with at least 1.5 million members (after Christianity, Judaism, and Islam), approximately 7% of the population.

Its beginnings, however, were subtle and small.

Early History of Buddhism in the United States

Buddhism first came to America, as many religions move, through commerce and trade. The first American merchant ship, the *Empress of China*, which reached Canton in 1784, was the first of many American merchant ships, often members of the East India Marine Society, which brought Buddhist statues and artifacts

along with silk, lacquer ware, furniture, and porcelains back to America.

In literary and intellectual circles, Asian religion appeared in Benjamin Franklin's *Oriental Tale* (originally titled "A Letter From China"; Franklin 1905–1907, pp. 200, 204, 205, 207–209), in the writings of Joseph Priestley, the letters of John Adams to Thomas Jefferson, and most notably in Hannah Adams' *Dictionary of All Religions* (1817/1992). Dissatisfied with the Christian bias in all the existing reports of other religions, Ms. Adams sets about to present other religions in the world in a more objective light. Using a Romanization of the sound of the Chinese character for Buddha, Ms. Adams wrote, "The most predominant sect is that of *Foe...*" (Tweed and Prothero 1999, p. 55).

The direct contact with actual Buddhists on American shores came with Chinese immigrants who began to arrive around 1820. Their number increased considerably beginning with the California Gold Rush of 1849, such that, by 1852, there were some 20,000 Chinese in California. Within a decade, nearly one tenth of the California population was Chinese. The first Buddhist temple in the USA was built in 1853 in San Francisco. By 1875, there were eight such temples. The Chinese Exclusion Act of 1882, which forbade the importation of any more Chinese laborers, stalled further immigration from China. Chinese Buddhism remained primarily a practice among the Chinese until the second half of the twentieth century.

Chinese Buddhism has grown enormously in the USA in the past 50 years. Largely a monastic group, the "City of Ten Thousand Buddhas" was established by Hsuan-Hua in Talmadge, California, in 1959. It continues as the headquarters of the Dharma Realm Buddhist Association. In 1978, the Hsi Lai Temple was established outside Los Angeles. Today there are over 125 Chinese Buddhist organizations in the USA, and they comprise an eclectic combination of different Buddhist schools, including Ch'an, Vinaya, T'ien-t'ai, Tantra, and Pure Land traditions. This eclectic approach may be found also in the Vietnamese Buddhism that came with the many immigrants

from the war in Vietnam and the Korean Buddhists who came in the last 50 years.

It was Japanese Buddhism that, from its first appearance, sought to engage non-Asian Americans. Its arrival may be dated from the *World Parliament of Religions*, which was held in conjunction with the Chicago World's Fair in 1893. Among the participants was Shaku Soen, a Roshi who would return to America 10 years later to promote Rinzai Zen Buddhism.

The Pure Land School of Japanese Buddhism sent missionaries, Shuye Sonoda and Kakuryo Nishijima, to San Francisco in 1898, to establish the Buddhist Mission of North America. In spite of the Japanese Immigration Exclusion Act of 1924, by 1931, they had established 33 temples.

With the United States' occupation of Japan after World War II, however, a qualitative leap was made by two gifted American soldiers who subsequently devoted their lives to the study and practice of Japanese culture and religion: Philip Kapleau, an American who learned about Zen as a court reporter for the War Crimes Trials, returned to the USA to found a Rinzai Zen training center in Rochester, New York, and Donald Keene who established a department of Japanese Studies at Columbia University.

These efforts by Americans coming back to bring Zen to other Americans were matched by the advent of three Japanese Zen masters: Taizan Maezumi Roshi, who established the Zen Center of Los Angeles in 1967; Shunryu Suzuki who founded the San Francisco Zen Center; and Soyū Matsuoka Roshi who established the Chicago Buddhist Temple in the Soto Zen tradition. At about the same time, though not an official Zen master, Daisetz Teitaro Suzuki, through his prolific writings and teaching at Columbia University, made Zen Buddhism well known throughout America, especially in academic circles. Suzuki's work achieved its greatest recognition in his last years in America, 1950–1958. Hakuun Yasutani Roshi, who first came in 1962, brought an integrated approach of both the Soto and Rinzai Zen traditions, as had Taizan Maezumi Roshi.

With the efforts of these teachers, Zen Buddhism sprouted exponentially during the 1960s, as

American counterculture went through a revolution that, through a combination of dissent against the growing war in Vietnam, rebellion against entrenched authorities in both politics and education, the death of God movement, the hippie movement, and the experience for many of hallucinogenic drugs with its mind-expanding (and sometimes destructive) effects, opened a path for nontraditional, non-Western religion.

The most recent entry of Buddhism into the United States is the Tibetan. Although there had been Tibetan Buddhists in the USA before, the great influx of Tibetans was prompted by the Tibetan holocaust in which Chinese Communists invaded Tibet and tried to extinguish its religion. Many people, including the Dalai Lama, went into exile at that point, to India, Bhutan, Nepal, Sikim, and America.

The other Buddhist tradition that has grown considerably in recent years, due to the instability of Laos, Cambodia, Thailand, and Burma (Myanmar), is the Theravadan tradition. Because of the influx of immigrants from those countries, many temples have sprung up in major American cities. Like their predecessors from China and Japan in the earliest days, they tend to settle into their respective ethnic communities and focus on the needs of the newly migrated.

Ongoing Interactive Impact Between Buddhism and American Culture

Although one may easily discern clear differences in the history and development of the Buddhism that came with immigrants from Asian countries, both recent and distant past, and the history and development of the Buddhism that grew with primarily Euro-American converts, there are several other developments that resist such a dichotomizing perspective.

While the references to Buddhism's presence in American pop culture above may be superficial (a designation which postmodernism would not deem negative), there are other developments that suggest Buddhism's influence is a major factor in American cultural change:

1. One of the main conditions that prepared American soil to be receptive to Buddhism was the flourishing of psychology and psychotherapy in the culture at large. Although the number of people who themselves entered into personal psychotherapy might be relatively small, from the 1960s on, the idea that the human mind was largely responsible for how people behave, that that mind was itself highly conditioned (from both depth psychological and behaviorist perspectives) and a source of unknown powers for creation and destruction (the unconscious), and that attention to the mind's assumptions and conditioning could bring healing and transformation made Buddhism a natural fit, because of the central role of mind in every aspect of the Buddhist quest for alleviating suffering. Buddhism, with its central admonition to look within for the source not only of one's problems and existential questions but for their resolution, entered American culture like a fish takes to water.

Psychology and Buddhism became twin partners engaged in the process of transformation. The number of books and conferences dealing with them as mutually enhancing as well as significantly different practices is incalculable. It set the stage for a global, not just American, evaluation of the relation between psyche and spirit. Prompted, to take just one example, by American, Japanese, and British psychologists, there have now been two International Conferences on Buddhism and Psychotherapy in Kyoto. There are now entire training programs in psychology at Buddhist institutes and universities, and Buddhism has come to be recognized as offering a model of mind that deserves to be included in the curricula of training programs for psychotherapy and chaplaincy:

2. Although Jesuits had been deeply engaged in the study and practice of Buddhism in Japan for hundreds of years, and a Jesuit wrote one of the most comprehensive histories of Buddhism in English (Dumoulin), it is reasonable to say that the birth of Buddhist/Christian dialog as a mutual exchange between equals, rather than

an exercise in polemic or condescension, was prepared in both a broader (larger audience) and deeper (as a dialog between Buddhist and Christian monks) way by the Cistercian monk, Thomas Merton. Moments before he died in Bangkok, Thailand, ending his only trip to Asia with his talk on “Marxism and Monastic Perspective,” Merton urged that the dialog between Buddhism and Christianity be continued across national, cultural, and linguistic boundaries. It has been continued since his death through a variety of forms and forums, including at least two events at Merton’s own monastery, the Abbey of Gethsemani in Bardstown, Kentucky. The dialog was broadened to include other Christians and Buddhist groups and lay people as well as monastics through the Society for Buddhist/Christian Services, which holds biannual conferences ever since. The impact of these dialogs continues to shape not only emerging consciousness among Buddhists and Christians but has created a much more comprehensive attention to all religions, leading many to prefer to speak of spiritualities rather than religions. Buddhist is thus a catalyst not only for Buddhist/Christian dialog but also for religious/spiritual consciousness in Americans generally.

3. It is perhaps not possible to tell the story of Buddhism’s explosive growth among converted Buddhists without a reference to the war in Vietnam in the 1960s and 1970s. Although America was deeply divided by the war and torn apart within over its worth, it unquestionably served to alienate many Americans from everything that was considered to be its cause – the establishment in political, economic, educational, and religious leadership. Among that alienated group, many found common cause and common mind with Buddhists in opposing the war, working for immigration and resettlement of displaced Vietnamese, Laotians, and Cambodians and conducting campaigns for peace. Led preeminently by a Zen Buddhist priest, Thich Nhất Hạnh, Engaged Buddhism emerged not only in America but also around the world as an effort

to raise consciousness and create change. It is distinctive within Buddhism in its emphasis on taking the personal transformation of consciousness that comes from meditation and reflection and shifting it to social consciousness and action for social change. It continues today as a powerful movement advocating for ecology, education, and political and economic reform, as well as opposing war. It is significant within America especially in offering a uniquely Buddhist approach to consciousness raising and public confrontation and finds expression through the Buddhist Peace Fellowship in Berkeley, California, and its journal, *Turning Wheel*.

4. The surge in Buddhism since the 1960s happened at the same time as the rise in women’s consciousness, the concern for women’s rights, and the political, literary, and economic critique of patriarchy. Unsurprisingly, therefore, Buddhism has become not only a catalyst for American change but has itself been changed by the feminist movement, challenged to look at and change its own long-entrenched patriarchy within Buddhist texts and hierarchies. Among others, Rita Gross and Stephanie Kaza have been on the forefront of integrating a feminist perspective into Buddhist thought and practice from the academic side. Enkyo O’Hara, Joan Halifax, Eve Marko, and Myotai Treace, among others, have themselves not only been ordained but received full transmission and authorization to teach and have developed their own sanghas.

With a critical analysis of patriarchy now clearly on the table of American Buddhism, the questioning of other aspects of patriarchal assumptions continues apace, with respect to understandings of gender identity and sexual orientation. Buddhism shares with Christianity, Judaism, and Islam a checkered history of views on homosexuality and transgender issues. As the gay and lesbian (and later, bisexual and transgender) liberation movement followed the civil rights movement for African Americans and the women’s rights movement, so Buddhism in America finds itself changing its traditional

assumptions about sexual differences (cf. work of Roger Corliss).

These four developments within American Buddhism are not experienced or shared with all Buddhists in America. Some immigrant Buddhists coalesce into islands of self-protected and self-sustaining communities, focused on the preservation of forms of language, culture, and religious practice, as they knew it on their native soil. Their children and grandchildren deal constantly with the often excruciatingly complex issues of assimilation and acculturation within America, often setting generations in conflict with severe fragmentation over authority and the challenges of a pluralistic America. We have grown, however, beyond the simple dichotomy of immigrant versus converted Buddhists into much greater complexity.

There are two small examples of what may open in the future: the first is the small book written by Eric Liu, former Clinton speech writer, *The Accidental Asian: Notes of a Native Speaker*. Liu traces in great depth his own struggle as a second-generation Chinese to come to terms with his father and the culture his father left behind, forcing the son to forge a new identity and bring his learning into the emerging American culture. This kind of personal reflection is a heart-warming and thought-provoking model of how one might struggle with all the issues of how to reclaim pieces of tradition and bring what remains valuable into the future. The second example is in a course taught by Dr. Paul Knitter, Paul Tillich Distinguished Professor of Systematic Theology and World Religions at Union Theological Seminary in New York, called "Double Belonging." Knitter makes the case for people who practice in two traditions and maintain them simultaneously without reducing one to the other nor rejecting one in favor of the other. This is one model for how to live between now and some as-yet-undetermined future form.

Although it is not possible to predict how these many movements within and outside Buddhism will affect its future in America, one may safely say that, consonant with the pluralism that pervades every dimension of American life, it may be more appropriate to look for the continuing

varieties of Buddhism than to assume any reduction in its complexity. If it so emerges, American Buddhism will thereby be both profoundly Buddhist and profoundly American.

Amita Buddha

Minqin (敏) Wang (王)¹ and Lee W. Bailey²

¹College of Foreign Languages and International Studies, Hunan University, Changsha, China

²Department of Philosophy and Religion, Ithaca College, Ithaca, NY, USA

The name “*Amita*” comes from the Sanskrit Amitabha and *Amitayus*, translated “Boundless, or Infinite Light and Life.” The Chinese is (阿弥陀佛) *A Mi Tuo Fo*, the Tibetan is *O-pa-me*, the Korean is *Amit'a Bui*, the Vietnamese is *A-di-da Phat*, and the Japanese is *Amida Butso*. He became in China and Japan especially, the supreme personification of the *Dharmakaya*, the highest enlightenment and the supreme beauty of infinite love, not one of many Buddhas but of Buddhahood itself (Malalasekera et al. 1961, p. 434). He was not conceived of as a god. He was a man who became an awakened Buddha in the traditional manner (Malalasekera et al. 1961, p. 438). Mahayana Buddhism believes that many awakened Buddhas can exist simultaneously, not just in past and future.

Pure Land

Amita is the leading Buddha of Pure Land (or Ultimate Bliss) Buddhism, practiced primarily in China and East Asia, and is spreading worldwide. The Pure Land is a marvelous transcendental western paradise of gold, gems, flowers, perfume, music, and numerous Buddhas. It is the goal of devotees of Amita to develop a Pure Land consciousness, to improve this life and prepare to

go to the Pure Land at death. This can be achieved in various ways, by repeating a mantra of the Amita with faith many times, thereby strengthening one's character and the tendency to do good deeds, and by meditating.

History

Historically, the earliest surviving evidence of Amitabha comes from the stone pedestal of an Amitabha statue discovered near Mathura, near Delhi (which was a major source of Buddhist sculpture) dated 104 CE, making it the oldest document of Mahayana Buddhism (Pure Land). Commentaries on Amita were written by masters of most every school of Chinese Buddhism. The earliest known sutra mentioning Amitabha, which is said to have begun the practice of Pure Land Buddhism in China, is the translation into Chinese of the *Pratyutpanna-samahi Sutra*, by the monk Lokaksema during the later Han dynasty (Lokaksema). A major shrine is on Lu Shan [Mt. Lu]. This was begun by Hui-yuan (334–416 CE), who founded an Amita Buddha group there in 402 CE, called Bai-lian-she. They practiced meditation based on the *Pratyutpanna Sutra*. It was on Lu Shan that the post-Liberation revival of Buddhism began in 1923 (Welch 1968, p. 55) (Fig. 1).

Amita temples are commonly built in conjunction with the goddess Guanyin, who is closely associated with Amita Buddha (Chen 1964, pp. 341–342). But in ancient Amitabha tradition, no women were allowed in his realm unless they were reborn as men (Malalasekera et al. 1961, p. 435). In Chinese Daoism, Amita-fo is also considered by some to be the incarnation of *Laozi* (老子). Some see early versions of Amita-fo imported from lands far to the West, others argue that it was brought from India, and others say that the concept of the Pure Land has been embedded in Chinese consciousness for thousands of years (Hsien 2000). After centuries of development in China, Amita Buddhism spread to East Asia, notably in Japan in the eighth century, when many temples were built in Kyoto.

Amita Buddha, Fig. 1 A MI TUO FO (Amita Buddha). (Courtesy of Wan Fo Chan Si, in Liaoning Province, at <http://www.wanfochansi.com/>)

Art

In paintings, mandalas, and statues, the bodhisattvas *Guanyin* (or *Avalokitesvara*) and *Da Shi Zhi* (大勢至) “Great Power Comes” are Amida’s two important assistants. The three together are called “the three saints in the Western Paradise.” Mandalas such as the eighteenth-century “Larger Sutra Mandala” portray Amita in the center in his characteristic seated meditative position, with the various elements of the Pure Land Western Paradise surrounding him. Large temples commonly housed numerous impressive statues (Taira 1961). In some images of Amita, he is standing on a lotus, with a halo around his head, holding a lotus or jar of royal unction, with a small swastika on his chest. This image, reversed, was taken by some warlike twentieth-century Europeans who horribly distorted its original compassionate

meaning. Amita art expanded to include images of the terrible punishments of Hell, as well as the blissful wonders of the Pure Land paradise. A colossal bronze outdoor statue of the meditating Amita, 50 ft high, was cast in 1252 in Kamakura, Japan, and called the Daibutsu or “Great Buddha” (LaFarge 1887).

Texts

A primary text in Sanskrit is *The Larger Sutra on Amitayus*, or *The Infinite Life Sutra*, in one of the Buddha’s past lives, when he was called the Buddha Lokeshvararaja. During the time named “The King of Freedom of the World” (世自在王), a king heard the Buddha’s teaching and then became a monk named Dharmakara, or in Chinese, *Fa Zang* (法藏) “The Container of Dharma.” The Buddha told him to create a realm, by his own efforts, where sentient beings could find utmost happiness. He took 48 vows, among which the eighteenth is the crucial one:

If, when I attain Buddhahood, sentient beings in the lands of the ten quarters who sincerely and joyfully entrust themselves to me, desire to be born in my land, and call my Name, even ten times, should not be born there, may I not attain perfect Enlightenment. Excluded, however, are those who commit the five gravest offences and abuse the right Dharma. (*Larger Sutra*, Part 1, 268, 48 Vows, 18)

And he also swore:

If, when I attain Buddhahood, sentient beings in the lands of the ten quarters, who awaken aspiration for Enlightenment, do various meritorious deeds and sincerely desire to be born in my land, should not, at their death, see me appear before them surrounded by a multitude of sages, may I not attain perfect Enlightenment. (*Larger Sutra*, Part 1, 268, 48 Vows, 19)

This scene has been recorded by many Buddhists in different times and places. This monk Dharmakara/*Fa Zang* became the major Buddha named Amita Buddha. Since then whoever wants to become a Buddha can get his help.

The *Amitabha Sutra* or *The Smaller Pure Land Sutra* is another primary text in Sanskrit. It is a

description of the Buddha speaking to a huge crowd of distinguished Gods and spiritual leaders. He described in detail a Buddha realm of Ultimate Bliss, or Pure Land to the West, which in China is the direction of spiritual wonders, where resides the Amitabha Buddha, who teaches the Dharma with excellent blessings. He says that there are Buddhas as numberless as the Ganges sands, such as the “Measureless Life Buddha” and the “Pure Sound Buddha” (The [Smaller] Amitabha Sutra).

In the third primary sutra, *the Amitayurdhyana Sutra*, Amita prescribes a threefold goodness: (1) support your parents, serve and respect teachers and elders, be compassionate, and abstain from injury; (2) take refuge in the Buddha, Dharma, and Sangha, fulfill all the moral precepts, do not lower your dignity, and do not neglect the ceremonies; and (3) give your whole mind to enlightenment, deeply believe the karmic law of cause and effect, study Mahayana doctrines, and encourage others to do the same (Malalasekera et al. 1961, p. 436).

Practices

Reciting the name of Amita with a sincere heart is the primary practice, but doing it for others is more meritorious than doing it for oneself. Accumulating merits is a path to the Pure Land, and in an ancient tradition, merit can be transferred to the dead. The highest goal is to become one with Amita.

Amita Buddha has another 37 names, among which there are 12 names connected with light, such as immeasurable, incomparable, joyful, pure, inexpressible, and all-pervasive. But Amita is generally called “The Buddha of Boundless Light” and “The Buddha of Boundless Life.” Whereas Shakyamuni Buddha is seen as a teacher, Amita is seen as a savior who gives faith.

Amita is not just the name of a Buddha but also a mantra, practiced not only by Buddhists but also commonly used as greetings by Buddhists and non-Buddhists in China. It is a kind of blessing, wishing that others may have boundless light and boundless life. It has such an

unfathomable power that people can escape from more than a thousand disasters when they hear the name just once. That is why people are encouraged to read his name.

Expansion from China

In Japan, widespread Amita Buddhism may be called *Jodo-Shinshu* or *Shinran*. Shinran (1173–1262) was a very important leader of what is now the largest Buddhist denomination in Japan (Malalasekera et al. 1961, p. 438). He forbade followers from praying for personal interests or temporal welfare. The faithful are to turn all difficulties over to the Buddha. *The Collected Works of Shinran* are primary Japanese sources. The mantra practice is called *Namu Amita Butsu* (“Adoration of the Amita Buddha”) or, in brief, *nembutsu* (Ryukan 1997b, “Major Expositions”). The simple practice of chanting such mantras gives Pure Land a wide appeal and contrasts with the more abstract and challenging paradoxes of other branches of Buddhism, such as Zen’s “Nothingness.”

There is a debate about whether calling the name Amita just once, even at the moment of death, is sufficient to attain birth into the Pure Land or whether one must call the name many times in life to achieve birth in the Pure Land. One answer is that many-calling is only the accumulation of single-calling, for death may strike at any surprising moment, even after one calling (Ryukan). The proper attitude is one of gratitude, service to Amita, free of selfishness and pride.

Psychology

There are numerous fruitful books on Buddhism and psychology. Psychotherapists who have also practiced Buddhism, such as Mark Epstein M.D., have expanded far beyond Freudian nineteenth-century materialism. They explore the similarities of psychotherapy and Buddhist practices. Both seek to bring to consciousness feelings that block healing or enlightenment, not always from childhood, but often in relationships. Buddhist

meditative practices – silent listening and mindfulness – are similar to therapeutic nonattachment from neurotic emotions, learning to stand back and observe them, rather than identifying with them. These and other themes are explored by many. Epstein’s focus is on humiliation, thirst, release, nowhere-standing, remembering, repeating, and working through (Epstein 1995).

Therapy in a rationalist society involves opening to intuition and a faith in finding an authenticity. This may overlap with the Buddhist opening to transcendence, discovered in visions, mandalas, mantras, and ethical guidelines. Amita chanting could be seen as a therapeutic practice of focusing the deeper mind on a refined higher self to detach the ego from neurotic habits of feeling. Taking refuge in the Buddha, the Dharma, and the Sangha could be likened to therapeutic commitment in psychotherapy, except with a transcendent purpose.

From a Jungian analytic or archetypal view, when caught in neurosis or suffering, one must first have or develop an ego strong enough to stand back and watch unconscious material coming up, rather than being overtaken by it and identifying with archetypal images, such as Jesus or the Buddha, and losing a sense of one’s human limitations. Then in psychoanalysis, one encounters unconscious feelings in dreams, fantasies, errors, or symptoms. This brings hidden feelings to consciousness, and can lead toward the ego’s serving the Self – the experience of archetypal divinity. Here Jung wrestles with the paradoxes of the Eastern extreme of identifying with the “non-ego,” the divine, or “becoming Amita Buddha,” and the Western extreme of identifying with the overly rational, conscious ego and denying the reality of the transcendent Self. The former may seem to allow “jumping over” feelings into the wonder-filled transcendent. The latter imagines the ego to be in control, free of unconscious or transcendent influences. Jung, and many Asian thinkers, rejects either Western absolutizing the ego or Eastern negating the ego. Rather, Jung seeks to direct the ego toward guidance from the Self, the archetypal experience of the transcendent divinity, as in Amita Buddha. “The ego needs the

self and vice versa” (Jung 1979, Vol. 11, para. 961). One might say: “Keep your feet on the ground and your head in the clouds.”

The Buddhist priest, university professor, and Jungian analyst Mokusen Miyuki says that the Amita meditative and chanting practices focus the mind on the Buddha. Jung saw religion as rooted in an experience of the numinous, as in rituals. So rituals such as chanting of the name of Amita (“Namo Amitabha” – “Adoration to Amitabha”) can produce experiences of the numinous which can reorganize one’s psyche away from egocentric focus toward sincere participation in the higher Buddha mind and thereby overcome suffering: “... the ego functions in conjunction with the self in creating a state of constant renewal and enrichment” (Miyuki 1994, p. 142). Miyuki agrees with Jung that this is not to dissolve the ego, but to let the ego be guided sincerely by the numinous Self or Buddha-mind, via the ego-Self axis or Dharma-gate, leading to birth of a stronger ego within in the uplifting, larger Pure Land consciousness.

According to Buddhism, everyone inherently has the Buddha nature – cosmic Light – in oneself. But during incarnation, the Light is typically clouded by all kinds of desires, such as crude greed, sex, and pursuit of wealth and fame. So if people read in Chinese “*Na Mo a Mi Tuo Fo*” (Devotion to Amita Buddha) or chant *Amita Buddha*’s name sincerely in any language, their unconscious will be activated and vibrate together with Amita’s power in the universe. Their soul will be full of the liberating Light that frees one from ego’s base desires, attachments, and suffering. They will become more sincere, happy, and enlightened and have a long life in this incarnation. They will be born into the transcendental, blissful, Pure Land consciousness.

Amplification

Joe Cambray

International Association for Analytical Psychology, Providence, RI, USA

Amplification is Jung’s signature method for identifying and accurately applying mythic, historical, cultural, and universal analogies to unconscious material of a collective nature. This can foster engagement with deeper resources in the personality, facilitating individuation. The idea developed as a part of his general study of associations and their dynamics, as when applied to dreams, fantasies, delusions, or hallucinations. In exploring such material as the fund of personal associations becomes depleted yet considerable psychological energy remains with an image, Jung recommended employing parallels from history and culture that drew upon the patterns in the collective unconscious such as myths, legends, folklore, fairy tales, and alchemy. This became a part of his method for identifying understanding emergent symbolic material, as in dreams.

Brief History of the Idea

Although Jung had discussed the use of comparative material from cultural sources in his Fordham University lectures on “*The Theory of Psychoanalysis*” in 1912 (in Vol. 4) and published an extensive study demonstrating the use of such material in *Wandlungen und Symbole der Libido* (first published in 1912, later revised to form the text of Vol. 5), it was not until 1914 in a lecture to the Psycho-Medical Society of London, published under the title “*On Psychological Understanding*,” that he introduced ideas which would more

clearly develop into the theory of archetypes in conjunction with the method of amplification (Jung 1915, Vol. 3, pp. 388–424; seen. 12). It may be that a full separation from Freud's influence, which occurred in 1913, was required before Jung could fully elaborate his own unique approach. In the 1914 article, Jung argues for a constructive as opposed to reductive method, leading to a noncausal, synthetic approach with prospective understanding that "build up towards an unknown goal." From the start, he linked amplification with complex processes that will culminate in his formulation of individuation.

By the time of his "*On the Psychology of the Unconscious*" in 1917 (in Vol. 7), Jung speaks explicitly of the method of amplification with a dream example comparing the causal-reductive and the synthetic-constructive approaches, including the use of imagery from the I-Ching. He demonstrates the psychological relevance and benefit of amplifying dreams with symbolic understanding. Throughout the 1920s and 1930s, Jung frequently used this method in a practical manner in his various seminars.

In 1935 Jung gave five lectures at the Institute of Medical Psychology (London's Tavistock Clinic) (see Jung 1980, Vol. 18). After acknowledging the feeling of not knowing that is inherent in any real contact with unconscious material, Jung explains how he proceeds, drawing upon his earlier researches in the word association experiment. "I adopt the method of the philologist, which is far from being free association, and apply a logical principle which is called *amplification*. It is simply that of seeking the parallels" (Jung 1980). He continues with the importance of understanding the context of each image in a dream for any overall interpretation, seeking "what tissue that word or image is embedded in. That is *amplification*." For Jung, this differentiates his approach from Freud's, which he feels "is seeking the complexes," whereas he is "looking for what the unconscious is doing with the complexes." The shift towards identifying operational dynamics in psychic processes considerably broadens the scope and utility of this method. Parenthetically the 38-year-old W. R. Bion, who at this time was unpublished, is

known to have been in the audience along with his patient Samuel Beckett who was greatly impressed by Jung. Bion went on to become a renowned psychoanalytic theorist whose work included exploration of mystical states. His work contains many echoes of Jung's comments, and his followers often employ myths in their explorations of unconscious contents.

In his 1944 treatise *Psychology and Alchemy* (Jung 1953/1968, Vol. 12), Jung includes an extended discussion of a series of dreams of a young man whom we now know was the Nobel laureate in physics, Wolfgang Pauli. The longitudinal use of amplification with such a dream series provides a fuller appreciation of the value of the method in the context of an observed individuation process. "As manifestations of unconscious process the dreams rotate or circumbulate round the center, drawing closer to it as the amplifications increase in distinctness and in scope" (Jung 1953/1968, Vol. 12, p. 34). The center for Jung is, of course, the transpersonal self. In this text, he also firmly locates the method in the alchemical tradition of transformation of substances: "The method of alchemy psychologically speaking is one of boundless amplification. The amplification is always appropriate when dealing with some obscure experience which is so vaguely adumbrated that it must be enlarged and expanded by being set in a psychological context in order to be understood at all" (1953/1968, Vol. 12, p. 403). From Jung's perspective, the alchemist's purpose in employing such a method was to bring out the hidden value in the rejected, unwanted, base aspects of life. Amplification thereby serves to orient consciousness to matters of deep importance that might be avoided if only viewed superficially.

From the late 1940s until the end of his life, Jung expanded his view of amplification to include both the method of active imagination and the feeling function. In his 1947/1954/1969 essay "On the Nature of the Psyche" (in Vol. 8) speaking about active imagination, he notes that it does not involve "a *reductio in primam figuram*, but rather a synthesis . . . a kind of spontaneous amplification of the archetypes" (Vol. 8, p. 403). Inclusion of a more profound valuing of

subjective experience, a feeling response, rather than relying only on scholarly researches to reveal the connection to the deeper layers of the psyche is seen in his 1958 essay “Flying Saucers: A Modern Myth” (Jung 1970, Vol. 10). There Jung remarks: “The symbological or ‘amplificatory’ approach produces a result that looks at first like a translation back into primitive language. And so it would be, if understanding with the help of the unconscious were a purely intellectual exercise and not one that brought our total capacities into play. In other words, besides its formal mode of manifestation the archetype possesses a numinous quality, a feeling-value that is highly effective in practice” (Jung 1970, Vol. 10, p. 646). Thus, in his fullest expressions of this method, Jung requires the whole person to partake of the action for it to be psychologically substantive.

There have been numerous developments in Jungian method over the years. In particular, articulating the cultural layer between the personal and the archetypal aspect of the unconscious has been an important refinement – see especially, Henderson (1993) and Singer and Kimbles (2004).

Contemporary Utility of Amplification

Various clinical and cultural implications stemming from the analytic method amplification have been noted over the years by Jungians. Some of the more important are:

1. Recognition of patterns of psychological life which are forming, be it in an individual or in a society. In the language of the contemporary science of complexity, systems which can self-organize to produce forms and behaviors operating at a level above that of the component parts, and not found in their component, but only coming into being through the field of interactions between the components, are termed emergent. Amplification can facilitate psychological emergence drawing attention to and focusing psychic energy on just those nascent patterns most relevant to life.
2. Providing a more richly textured narrative background for a life, helping a person discovers aspects of being which live in myth. For the disenfranchised elements of the personality, this can offer a helpful link to the consciousness as well as to the broader human community. The method thus allows a pathway for engagement with archetypal energies, at the core of complexes which comprise the personality. Making unconscious processes more ample through the adroit use of analogies renders these processes more available to examination; see, for example, Samuels in *Post-Jungians Today* (Casement 1998). In applying this method, care must be taken that narcissistic elements which can become dangerous, as through inflation, are not excessively activated, but that there should be a relativizing of the ego and a metabolizing of any identifications with the self.
3. Deciphering the potential significance of unconscious productions such as symptoms and dreams through a comparative process. This can provide valuable orientation with diagnostic and prognostic value, which can help in determining a course of treatment or intervention. For an example, see remarks by John Beebe on the “case of Joan” in *The Cambridge Companion to Jung* (Young-Eisendrath and Dawson 1997) regarding a patient’s suicide wish to “. . . jump in a river” as a kind of urge towards baptism, or spiritual renewal through immersion in unconscious processes, which addressed this use of amplification. Beebe integrates the religious ritual dimension of the impulse with clinical thinking by suggesting it may point to a need for a period of regression, with less organization or verbalization available to patient and therefore the possible use of artistic forms of expression to sustain engagement; a period of quiet containment as dissolution forces breakdown the old structures. Note that in the clinical setting, actual amplifications are often not shared explicitly with the analysand. As with Jung’s later thoughts on active imagination and “spontaneous amplification,” reverie, as explored by psychoanalysts such as Thomas

Ogden, may itself be seen as a form of amplification, especially when used to explore an interactive field, to make the exchanges occurring within it more available to consciousness. The psychoanalytic literature does not touch, however, on the notion of reveries linked with the collective unconscious, which is one way of looking at myth.

4. Shedding light on archetypal processes occurring intersubjectively as well as intrapsychically, within an interactive process as Jung indicated in his essay on *The Psychology of the Transference* (Jung 1946, Vol. 16). The analytic field may manifest in metaphoric or symbolic form in an emergent process, as when a psychological content becomes activated for both partners in an analysis. These often have a synchronistic feeling as in Jung's famous story of the woman who dreamed of a piece of jewelry in the shape of a scarab beetle, and in the process of the analysand's telling of the dream, Jung caught a similar beetle inexplicably trying to come into his office window and later amplified the figure of the beetle in terms of Egyptian rebirth narratives, which were relevant to the case. Once in a secured, symbolic field (Goodheart 1980), amplification can thus support a mutual playfulness at the root of creativity.
5. Provides a more expansive model of the psyche, allowing inclusion of cultural processes. This can form a basis for understanding unconscious aspects of social, political, religious, aesthetic, historical, and even scientific discourse. While the use of symbolic forms always derived from a cultural and historical context, there is most likely a biological predisposition to generate these forms (see Pietikainen (1998) and responses). There remains the need to more fully trace out the cultural evolution, including disjunctions, and variations of these forms.
6. Helps to identify the scale-free network qualities of the field of the archetypes of the collective unconscious thus allowing contemporary research on networks to be applied to Jung's model of the psyche. For ease of comprehension, consider the World

Wide Web which is just such a network, with sites connected by hyperlinks: the pattern of nodes (sites with few links) and hubs (sites with large numbers of links) together with their lines of connectivity. These networks have self-organizing properties which foster resilience of the overall network to removal of nodes. Psychologically this offers new insights into both the resilience of defenses in analytic work and the possibility of stabilizing new relations between the ego and the unconscious which develop during such work – for an initial discussion of this, see Cambray and Carter (2004), Chapter 5.

Analogy (Islamic)

Amani Fairak
Heythrop College, University of London,
London, UK

Analogy (Islamic) or *qiyas* is the fourth source of Sharia (Islamic Law). In case of the lack of direct text, from the Quran or Hadith, on any contemporary issue, making judgment based on analogy is permissible by Sharia. Analogical reasoning can be deduced from a known Islamic judgment and then applied to the unknown problem within the Islamic model of the Quran, Hadith, and the Islamic consensus. This means that the Quran and Hadith can be further analyzed and extended from a primary known issue (*asl*) to a new problem (*fara'*) if there is a common cause (*'illa*) for both problems.

Example: drug abuse and wine drinking are both not permitted by Sharia although they are two different problems. The first was not known

in the early days of Islam and it was not mentioned in the Quran or Hadith. Analogically speaking, since drug abuse has the same effects of alcoholic abuse (Loss of Consciousness), which is forbidden in the Quran and Hadith, therefore, drug abuse must be banned by law as well.

Analytical Psychology

Claudia Nagel
Nagel and Company Management Consulting,
Offenbach, Germany

Introduction

Analytical psychology is based on the works of C. G. Jung (1875–1961). The term was first used by Jung in 1913, when he left the psychoanalytic community that developed around Sigmund Freud to describe a new psychological science aimed at exploring the unconscious and its relationship with the conscious. His focus lies on a different notion of the self, the compensatory and self-healing function of the psyche, symbols, archetypes, the collective unconscious, and the need for individuation. Over the course of life, the individual may go through this process of individuation enabling them to achieve their innate potential and thus give meaning to their life by becoming more and more conscious.

Jung studied medicine (M.D. in 1900) and underwent additional training in psychiatry (1905) at the Swiss Burghölzli Clinic. His close relationship with Freud lasted from 1907 to 1913. After the painful break from Freud, Jung underwent several years of auto-analysis, and in 1921 he published his work psychological types, which formed the basis of an independent psychological school of thought, analytical

psychology. In the first 30 years of his life, Jung laid the foundation for the extensive psychological oeuvre, dedicating himself in later life to the study of history, religion, and cultural history which strengthened and differentiated his theory (Stein 1998). Throughout his life, Jung devoted himself to exploring the question of whether and, if so, how spiritual and mythical experiences can be investigated by empirical scientific methods.

The Nature of the Self

Although, to cite Murray Stein, Jung has designed a map of the human soul, it is the development of the Self which is at the center of his explorations. His concept of the Self (with capital S) is fundamentally different from other schools of psychoanalytical thought in that it forms the basis and the goal of human development. The core element in the process of individuation, which is central to his psychoanalytical approach, is the unfolding and development of the self. Man is to become what she/he is destined to be.

Jung's concept of the Self differs from the self-concepts of other psychoanalysts (e.g., Kohut), primarily regarding the idea of transference. This Self is situated outside the individual psychic field, which it defines but in which it is not contained. This is not the "I-am-(my) self," but rather something incomprehensible, unperceivable, and greater than oneself. The Self forms the primeval basis for the communality of the subject with the world, with the basic elements of being. Subject, object, I, and other are connected in the Self in a common field of structure and energy (Stein 1998).

"As an empirical term, the Self defines the totality of all psychic phenomena in human beings. It expresses the oneness and wholeness of the total personality (...); it comprises that which can be experienced and that which cannot be experienced or cannot yet be experienced. (...) In as far as wholeness, which consists of both conscious and unconscious contents, it is a postulate, and it is essentially transcendent (...). As there are, in fact, phenomena of the conscious and the unconscious, the Self as a psychic totality

contains a conscious as well as an unconscious aspect. Empirically the Self becomes manifest in dreams, myths, and fairy tales in the figure of the "superordinate personality" like a king, hero, prophet, and redeemer or as a symbol of totality as, e.g., the circle, quadrangle, quadratura circuli, and cross. In as much as it represents a *complexio oppositorum*, a union of opposites, it can also appear as a union of two as, e.g., the interaction of yang and yin in the Tao (...). It thus confirms itself as an archetypal concept which is different from other concepts in that it takes a central position through the significance of its content and its numinosity" (Jung 1921/1995, CW 6, § 891).

The Numinous

Often misunderstood, the term numinosity is key for Jung. The numinous corresponds to the God-image in the individual – and not to God itself. The archetypal character of the numinous manifests itself in different symbols which occur across all cultures and express the relationship between the numen and human beings again and again in similar ways (e.g., mandalas, crosses). Jung therefore postulates that man is in essence religious and that religion is a native form of expression or attitude of the psyche. His work, however, contains no statements regarding his personal faith. "One might then say that the term 'religion' denotes a particular attitude of a consciousness which has been altered by the experience of the numinous" (Jung 1939/1995, CW 11, § 9). This numinous, the inexpressible, mysterious, and at the same time terrifying, is that which is particularly moving or touching in the perception of the Self. It is the perception of wholeness which transcends conscious reality. As the numinous reflects this divine character, the Self corresponds to the God-image or "a God in us." However, Jung makes a clear distinction between the question of the existence of God and the God-image.

"It is, of course, due to the perpetual commingling of object and image that one cannot understand the difference between "God" and

“God-image” and therefore believes to be speaking of God – to be explaining “theologically” – when speaking of the God-image: Psychology as a science is not entitled to call for the hypostatization of the God-image. Nevertheless, consistent with known facts, it needs to anticipate the existence of a God-image. It is therefore (...) understood that (...) the God-image corresponds to a specific psychological complex of facts and thus represents an important element and a basis for work, yet the question as to the nature of God is not to be answered by psychological science” (Jung 1928/1995, CW 8, § 528).

Reflected in the Self and in the symbols of the Self are thus human experiences with the Divine, although neither of these permits any conclusions regarding the nature of the Divine.

The Self-Regulating Psyche and the Role of Symbols

Analytical psychology assumes that the function of the Self is to hold the dynamic totality of the psychic system together. If, for example, symbols of the Self occur in dreams, this may be seen as a compensatory act of the psyche aimed at healing a psychological crisis in the conscious. In the totality of the Self, opposites like good and bad and light and shadow are united. The perception of this totality expresses the wish for psychic union of the opposites in a synthetic third, which constitutes a decisive factor in the process of personal development. The principle of opposites and enantiodromia is based on the concept of self-regulating psychic mechanisms. The psychic energy expressed in the striving for individuation is directed toward the achievement of wholeness and is controlled and driven by the Self as a transcendent center outside the psyche. It is therefore not the ego which is responsible for the process of individuation, but the compensatory function which is the deciding factor. The self-regulating function of the psyche implies that the unconscious counterbalances the one-sided tendency of the conscious. “For all excessive processes compensations are made immediately and inevitably” (Jung 1947/1995, CW 16, §

330). It is primarily the repressed or other unconscious content which – in the presence of excessive one-sidedness – irrupt into consciousness in the form of dreams, images, or irrational actions (like the famous Freudian slip).

The symbol, which has a central role in analytical psychology, consists of different aspects “thrown together” (the Greek root *symbállein* signifies to throw together): antithetical (conflict, polar aspects), conscious and unconscious (transcendent function), past and future (myths and dreams), form (image), and inner and outer (projection) content. Areas or aspects which are (can) actually not (be) directly related are connected with each other in different constellations through the symbol so that something new, a third, is created, i.e., the symbol. The development of the symbolic attitude is therefore of crucial importance in the process of individuation. The transcendent function enables the emergence of a symbol. It is the capability of the psyche to unite pairs of opposites in synthesis and a new third. The transcendent function connects the unconscious with the conscious: a creative relationship develops in which the transition from one attitude to another becomes possible. Symbols and archetypes are the vehicles of the transcendent function.

The Role of the Ego

The symbol-forming function of the soul – and thus the compensatory function – can become effective only if it is comprehended by the ego, i.e., the symbols have to be understood and integrated with the help of the conscious. The ego should be in a compensatory relationship with the self, and a so-called “Ego-Self” axis (E. Neumann) should be formed. This Ego-Self axis illustrates the dynamic relationship between the ego and the Self. Neumann assumes that the ego dissociates itself from the Self at the beginning of and during the first half of life; consciousness develops, and a center of consciousness in the form of an ego-complex arises. According to Jung, the essential part of the individuation process occurs in the second half of life, which

is marked by a backward movement of the ego to the Self, characterized by the broadening of consciousness and integration of the personality. Although the concept of dissociation of the ego from the Self advanced by Neumann has lost importance in the light of more recent findings in developmental psychology, the Ego-Self axis is nevertheless helpful in understanding the self-regulating function of the psyche. An identification of the Ego with the Self would, for example, be an indication either of inflation or of psychotic delusions of grandeur.

The ego in analytical psychology is the center of the field of consciousness and is also understood as the ego-complex. It is characterized by a high degree of continuity and identity with itself. "The ego-complex is a content of the conscious as well as a prerequisite thereof, because I am conscious of a psychic element, in as far as it is related to the ego-complex" (Jung 1921/1995, CW 6, § 810). The ego is a part of the total personality and the prerequisite of our ability to experience and reflect on the world and ourselves. The ego is not a creation of our conscious wanting; it transcends it.

Environmental factors have a role in ego formation and are described by Winnicott as the "facilitating environment." From today's perspective, the ego or ego-complex, like all complexes, is formed in early infancy as the result of attachment relationships; in later life, other relationship experiences also contribute to the formation and alteration of the ego-complex.

Complexes and Archetypes

Jung viewed complexes as more or less unconscious psychic content held together by an identical emotion and a common core of meaning – the archetype. He understood a complex as an unconscious focal point of psychic processes charged with a high degree of negative or positive emotional energy. A negative complex may be caused by a deeply felt emotional experience, psychological trauma, or negative childhood experiences. Complexes may also be seen as "split off components of the psyche" (Jung

1934/1995, CW 8, § 204), which, if they have not yet become conscious, may cause psychic disturbances in the unconscious. Jung demonstrated the effectiveness of complexes with the help of the association experiment, whereby the presentation of complex-charged words can produce reactions as well as a galvanic skin response. Today, complexes are understood as the dynamic compression of internalized relationship experiences, capable of changing and developing throughout life. Complexes can be compared with other psychological models as, e.g., Stern's representations of interactions generalized (RIGS) or the internal working models developed by Bowlby. Analysis focuses on the elucidation of these complexes: they are brought to consciousness, emotionally worked through, and processed. The symptoms of a complex can be understood and interpreted symbolically. This enables the release of the psychic energy bound in the symptoms, the psychic equilibrium and inner-balance can then be re-established, and an instant of personality integration occurs.

Complexes always have an archetypal core. Comparable to complexes, archetypes are a central building block of analytical psychology. Based on Kant's concept of the *a priori*, Jung postulates the existence of an *a priori* in all human action and thought, an "innate and therefore preconscious and unconscious individual structure of the psyche" (Jung 1939/1995, CW 11, § 151). These preconscious structures cannot be described; they are a type of unconscious predisposition to act in a certain human manner. They have no concrete content and are therefore to be understood as shapes or "primordial images" which are passed on from generation to generation. "Visible" content is added to the archetype through individual experience. Archetypes in addition to the Self, which is frequently described as the primary archetype, include the animus and anima, the shadow, and the persona. Neurobiological findings have contributed to a somewhat changed understanding of the archetype. Today it is preferred to view archetypes as "image schemas, early developmental mental structures which organize experience while themselves remaining without content and beyond

the realm of conscious awareness. . . . The image schema would seem to correspond to the archetype-as-such, and the archetypal can be equated with the innumerable metaphorical extensions that derive from image schemas” (Knox 2003, p. 96). Archetypes represent mechanisms which serve to organize experience in the human brain and appear to be unconscious “representations of dynamic patterns of relationship between self and other” (Knox 2003).

The Collective Unconscious

At first glance, the new perspective appears to render access to Jung’s essential construct yet more difficult, particularly because it has an important role in religious considerations, i.e., the collective unconscious, which Jung differentiates from the personal unconscious. However, recent research in developmental psychology has demonstrated the phylogenetic endowment of newborn infants with regard to communicative abilities. The collective unconscious represents the deepest layer of the human psyche, formed from universal archetypes and instinct-based forces identical for all humans.

“We can differentiate a personal unconscious that comprises all acquisitions of personal existence, i.e., what has been forgotten, repressed, subliminally perceived, thought, and felt. In addition to these personal unconscious contents, there is other content which does not derive from personal acquisitions but from the congenital possibility of psychic functioning per se, namely, from the congenital brain structure. These are the mythological aspects, motifs, and images which can develop at anytime and anywhere without historical tradition or migration. These contents I describe as the collective unconscious” (Jung 1921/1995 CW 6, § 919f).

The collective unconscious reveals itself primarily in myths and fairy tales, the analysis of which appears primarily in dreams, literature, art, and culture and enables access to archetypal content. The language of the unconscious is symbols and images, because these exert a powerful influence on the conscious, in particular with a view to their numinosity. The psychological

unconscious is further ascribed a tendency toward finality, which finds expression in the teleological principle. Within the framework of the individuation process, the individual might succeed in grasping the finality of the unconscious from the individual perspective, enabling them to experience their own actions and life as meaningful. To a degree determined by itself, the ego is thus forced to comply with and understand the demands of the Self. This individual striving for meaning can therefore be understood as religious.

Ananda

Paul Larson
The Chicago School of Professional Psychology,
Chicago, IL, USA

Ananda was one of the main disciples of the Buddha. He served as his personal attendant and

occupies a similar place in Buddhism that the Apostle John does in Christianity. Both were very close to their Lord in a personal as well as spiritual way. As such, Ananda wielded much influence in the First Buddhist Council, immediately after the death of the Buddha (544 BCE). Because of his close relationship to his teacher, he is the source of many of the stories told in the canon of scripture known as the Sutras (Skt.) or Suttas (Pali). Of all the qualities attributed to him, good memory was one. Service to others was another. His name means “bliss.”

Ancestor Worship

Eswarappa Kasi and Gladis S. Mathew
Department of Tribal Studies, Indira Gandhi
National Tribal University, Amarkantak,
Madhya Pradesh, India

Most religions deal with the attempt of human beings to understand something or some power which is mystic and supersensory, and the practice of ancestor worship is one such kind. The word “Ancestor worship” was coined by the famous British Philosopher and Sociologist Herbert Spencer in the year 1885 and refers to a ritualized summoning of deceased kin. According to Edward Burnett Tylor (1832–1917), one of the founding fathers of Anthropology, the spirits grew out of attempts to explain life after death. He also considered that the spirits are separate entity from the body and a human has two souls, i.e., free soul and the body soul. The free soul remains alive after death whereas the body soul disappears after the post-burial ceremony. Ancestor worship is much more related to animistic belief in the souls and the spirits of dead ancestors. The worship is not purely considered as a religion itself, but religious appearance component, which

identifies an element beyond the human power. Ancestors, irrespective of whether they are dead or alive, are the major part of every society. Ancestor worship is a religious form of devotion which calls attention to the influence of departed relatives on the living. Ancestors are said to be semi-heavenly beings who received obligations. They bestow beneficial gifts, heroes, and wealth and ensure the success of those among the living who venerate them (Sayer 2013). They are acknowledged and honored in most of the societies like local deities and Gods. It is also believed that ancestors live after their death, monitoring the deeds of the next generation. Ancestor veneration is giving respect and love to the deceased soul. The word “veneration” is often used interchangeably with the word “worship.” However, the term “worship” underscores a reverence of what is divine and supernatural, thus carrying a more religious undertone (Zhao 2006). It is considered that if the living generation fails to provide respect to dead ancestors, then their spirit or soul will curse them and it will bring bad fortune to their kids.

Why to Worship Ancestors?

In the belief system of some societies, as observed by Majumdar and Madan (1956), “the supernatural may consists of ghosts and spirits, for others it may be a belief in the impersonal power which pervades everything in this world, while for some other people the supernatural may be manifested through a pantheon of anthropomorphic God and Goddesses, or through a simple God.”

A systematic analysis of ancestor worship shows that:

- (a) It is a way of showing love and respect to the departed relatives as they are treated as mentors in many places.
- (b) It is also performed out of fear: people believe that if ancestors are not treated well, they may take revenge from the living generation by harming them and their kids.
- (c) Fear of society and social criticism compels people to offer worships to their ancestors.

- (d) It is also believed that if worship is not properly offered to ancestors, their souls and spirits remain searching a place to reside in-between heaven and hell.
- (e) Prayers to ancestors are offered asking for good crops, fertility, good fortune, success, etc.
- (f) People also believe that after death ancestors share the lands with God, so worshipping ancestors is next to worshipping God, as they believe that ancestors help them to transmit their message to God.
- (g) People commune with their ancestors in order to foretell their future, gaining advices on a variety of dealings of their life.
- (h) After death ancestors are considered as the guardian angels for the family.
- (i) People also offer prayers asking their ancestors to forgive them for their wrong deeds.
- (j) It is also believed that worshipping ancestors helps in letting their souls free from this living world.

Ancestor Worship Around the World

Within the discourse of ancestor worship, few scholars found that there are some evidences of cults in few societies. Cult is another aspect of religion which does not arise as a protest movement but remains part of the religion. It is acting out of feeling, attitude, and relationships which are an end of themselves.

Ancestor cult is not constrained to people in “primeval” culture. It brings into being on every stage of social and educational development within the same cultural setting. But, this expression may mean one thing to the literate and may convey another thing to the laymen. Varying from group to group and from people to people, it has many diverse forms of expression in all societies.

According to the anthropological theories, as discussed by Zhao (2006), “there are two types of cults, the first one is a domestic cult observed by the family in devotion to its recent ancestors rather than the isolated past. The other type is observed by the descent group in dedication to its common ancestors in the remote past.” Further, as stated by

Hwang (1977), ancestor cult is found in all the five continents and it is more widespread than many scholars do realize.

Ancestor worship in some places is considered as one of the major branches of man's religion and also as one of the most vital religious lexis of mankind. For many Chinese, Africans, and American Indians, ancestor cult is probably the only religious practice they perform in their life and the only way they know of to fulfill their religious need (Hwang 1977). In China, almost everyone practices ancestor worship. Ancestor cult has not diluted very much since its far-flung beginning though in the traditional Chinese family structure it has its own importance. It has a chief place in both the social and spiritual life of Chinese natives. Chinese societies believe in the existence of multiple souls like *hun* and *po*. They feel that the *hun* and *po* get separated after death and the first one will go to heaven and the second one will descend into the earth.

The practice of ancestor worship is also popular in West African societies, which includes the *Ewe* of Ghana, which has very definite ideas about life and death. They believe that human life is composed of two major souls, i.e., the *Mawu* and the *Tsiefe*. The first one is considered as the creator and the latter one is considered as the spirit world. Certain rituals are performed to help the dead complete the journey to the spirit world. It is also believed that after the post-burial ceremony, the spirit of the dead goes to the spirit world and joins with the other ancestors of his family and invites to assist the food offered in the rituals of ancestor worship.

The natives of North America honor their dead ancestors with traditional ceremonies, which includes food offerings and prayers. They put flowers and candles on the graves of their ancestors and celebrate special days like *All Soul's Day*, in which the relatives and friends of the deceased soul gather together to pay respect to the departed soul. In other Catholic countries like Europe, a special day like *The Day of the Dead* is also celebrated in which they remember their faithful ancestors.

In India the period of *Pitra-Paksha* is observed during the dark half of the Hindu month of

Ashwani. During this period, family members donate food to birds such as crows and animals like cows in the hope that their ancestors also be thus fed. By doing this they feel that they are repaying the debt. Ancestor worship is not an ordinary cult of the dead in India. It has its own interpretation. It is not applicable to a kid died at a young age or any elder one who is not a part of their family or the other kin members.

The practice of ancestor worship is mostly found in every country and continent but the way of doing it might be different from one another. The essence of performing this worship is giving honor to the ancestors. The beliefs may be different but the emotional feeling behind their worship is almost the same everywhere.

Homage to Dead Ancestors and Psychological Beliefs

It is always believed that the soul of ancestors remains alive after death also, searching for peace. Paying homage to ancestors is considered as a sacred ritual in all religions and it is also considered as the holy duty of the living generation to perform it as a tribute to their ancestors, without whom they would not have survived on this earth.

Paying homage to ancestors varies from place to place. Some of the common ways are as follows:

- (a) Feeding the dead and offering them their favorite food on special occasions
- (b) Offering food to animals and birds like crow, cow, pigs, etc. in the name of the dead ancestors
- (c) Sacrificing animals and birds like hen, sheep, goat, etc. as a part of remembrance
- (d) Offering flowers and sweets to priests and placing it in front of their family God
- (e) Calling relatives for feasts
- (f) Putting candles and incense sticks in front of their photographs
- (g) Performing charity
- (h) Donating money and other useful things to needy persons

- (i) Visiting the cemetery or the places where the ancestors took their last breath

According to the famous theory of Evolutionalism in Anthropology, many scholars talked about the “psychic unity of mankind,” which means that every human being in this world somehow thinks in the same direction. This theory was also criticized by later scholars who came up with the concept of “Culture Schemas.” It refers to the mental illustration of exemplary events, actions, and things; these schemas define for the person, the nature of any state of affairs in which he or she is involved. In their recent paper “Schemas and Frames,” Wood et al. (2018) have mentioned that the history of the schema concepts in the cognitive sciences from psychology to artificial intelligence to anthropology and cognitive neuroscience. Earlier, Sherry Ortner (1978), in her book, *Sherpas Through Their Rituals*, tried to argue that “Sherpa Social and religious history utilizes a notion of cultural schemas, recurring stories that depict structures as posing problems, to which actors must and do find solutions. Further, structure comes here as part of a package of emotional and moral configurations, and not just abstract ordering principles.”

Further, scholars have also argued that the mind of the human being is considered as the most important part of the body. The human mind always has a preconception about “good” and “bad.” The mind always tends to go for happiness and avoid sadness, leaving bad things aside. We can see this in the practice of ancestor worship as well. The practice of ancestor worship is found in most societies in different forms. In every society, people worship their ancestors as they believe that if they don’t do so, the soul of their ancestor will curse them and bring them bad fortune, leading to sadness. Thus, we argue that the “psychic unit of fear” in the mind of the living generation leads them to worship their ancestors in most of the cases. Further, people believe that worship of their ancestors will protect them from evils and bless them with good health and wealth. In other way, we can argue that by doing so they

use to get a satisfaction of mind that they are being protected and blessed.

To conclude, ancestor worship is a form of belief system which has a great significance in terms of the traditional society. This is a form of behavior not merely between human to human but also between the human being and the eternal soul and their cultural values. In connection with every religion, whether ancient or modern, we find on the one hand certain beliefs, and on the other certain institutions, ritual practices and rules of conduct (Busia 1959). But due to the changes in all spheres of life of humans and their worldview, the practice of ancestor worship has also resulted in change. Further, the concept of ancestor worship has changed in some way but the thrust and essence of the custom and rituals are the same. Nowadays, due to hectic schedules and work culture, people are not paying much attention to their ancestors. The rituals performed for ancestors are also shortened up because of shortage of time. With the advancement of technology and development, the younger generation is paying less attention to their ancestors and the practice of ancestor worship in some way or another, which is a cause of concern not only for social scientists but also for psychologists and other human sciences.

Androgyny

Jeffrey B. Pettis

Department of Theology, Fordham University,
New York, NY, USA

Plato's *Symposium* addresses the subject of human nature (*anthrōpinen physis*) in its former state (*palai hemōn physis*) (189D). According to the speaker, Aristophanes, there were not two but three “kinds” (*ta genē*) of humans: male (*arren*), female (*thēlu*), and an equal combination of both male and female (*ampheterōn*) (189D). In this third type, male and female are joined into the form (*eidos*) of one unity, *androgynon* (189E). This *androgynon* is quite vital, which, according to Aristophanes, threatens the gods who thus split the form in half, creating the separate forms, male and female. Each has only a portion of the original vigor and is therefore no longer a concern to the divine patriarchy. Aristophanes says, this “man-woman” nature has ultimately been vanished (*aphanistai*), and Aristophanes himself appears to devalue it by referring to it as a “thing” (*auto*). Other notions of androgyny also occur. The ancient Gnostic text *Interrogationes maiores Mariae* quoted by Epiphanius of Salamis (d. 403 CE) tells of Jesus producing a woman from his side. The image symbolizes Christ as the Anthropos, the Second Adam who is both male and female after the way of the first, hermaphroditic Adam (cf. Gal. 3.26–28; Matt. 22.30). In Hindu Vedic traditions, the androgynous Original Man Purusha, who “as large as a man and woman embracing,” divides his self to

create husband and wife (*Brihadaranyaka Upanishad* 1.4.3; cf. *Aitareya Upanishad* 1.1–14; *Atma Upanishad* 1–3). In the Cabbalist tree, King David is associated with the tenth sefirah *Malkhut*, the feminine aspect of judgment. She is *Matronita*, the Grand Lady of the cosmos. She has a special affinity for the left side, being referred to as the gentle aspect of wisdom. Within the history of the Church, the eleventh to thirteenth centuries show particular interest in the androgyny of Christ. The Cistercians are especially noted for a reworking of the symbol of Jesus and the integration of the feminine aspect. Anselm the theologian and Archbishop of Canterbury (1033–1109 CE) writes: “But you, Jesus, good Lord, are you not also a mother? Are you not that mother who, like a hen, collects her chickens under wings?” (Anselm of Canterbury 1940–1961, Prayer 10 to St. Paul, 3:33, 39–41). The French abbot Bernard of Clairvaux (1090–1153 CE) in his series of sermons on the Song of Songs refers to the refreshing sweetness and perfume of the breasts of Christ the Bridegroom. They are “better than wine, but smelling sweet of the best ointments” (Bernard 1987, Sermon 9.4). According to Jung, the separating into male and female sets up a pair of opposites and makes consciousness possible. It manifests latent symbolism and unconscious processes as compensation response to external, conscious condition of undifferentiated unity (Jung 1969, p. 204 ff.). Jung also equates the duplex figure to the Anthropos as the idea of wholeness and unitary being which existed prior to human beings and represents the end-goal of human life. As Anthropos, the androgynous figure occurs as the essential, governing archetype and “organizing principle of the unconscious, the quaternity, or squared circle of the self” (Jung 1969, p. 204).

Angels

V. Walter Odajnyk
Pacifica Institute, Carpinteria, CA, USA

The word comes from the Greek *angelos*, a translation from the Hebrew *mal'akh*, meaning “messenger.” In the major Western religions, angels are ministering spirits and guardians of the supreme deity and serve as messengers and intermediaries between the divine and human realms. They act as extensions of the divine will, reveal divine truth, watch over the world, and guide souls to their postmortal destiny.

The motif of attendants upon the supreme deity who also serve as messengers and intermediaries between heaven and earth is widespread. In Chinese and Japanese religions, there are ministering spirits and divine messengers whose role is similar to those in the West. The ancient Mesopotamians depicted giant winged genies as divine ministrant and guardian spirits. In Zoroastrianism there are six spiritual entities that attend the chief deity. In Hinduism the *angiris* are the messengers between gods and men. The function of a Boddhisattva in Buddhism is comparable to that of an angel. Hermes and Iris, both with winged sandals, are the divine heralds in Greek mythology. The messengers of the Celtic Otherworld often appear in the guise of swans. But not

all winged entities are angels. Wings indicate swiftness (the winged sandals of Hermes and Iris) and the ability to function in the air and by analogy in the realm of the spirit. The winged Nike represents the spirit of victory and is not an angel, i.e., a messenger.

In the Bible, angels appear as wingless young men. Only the Seraphim and Cherubim are winged and not human in form. Until the thirteenth century, angels were depicted as adolescent males. The late Gothic romantic ideal of beauty led to the feminization and etherealization of the angelic form. In popular belief, angels are divine or semidivine creatures entitled to be worshipped in their own right. They are sometimes equated with daemons, fairies, elves, jinn, etc. that are amenable to human manipulation and used in magic. The notion of a personal guardian angel developed in the second century CE. probably influenced by various religious and folk beliefs in protective ancestral guardians or spirits.

Judaic: Angels appear often in the Bible as messengers and protectors. The most striking representation of angels as intermediaries between the divine and human realms is Jacob’s dream of the ladder reaching from earth to heaven with angels ascending and descending on it and God standing at the top of the ladder. An angel stayed Abraham’s sacrifice of Isaac, wrestled with Jacob and named him Israel, and appeared in the midst of the burning bush to Moses. The Seraphim, fiery, serpentine, six-winged angels, surround the throne of Yahweh. The Cherubim, four winged and four faced, bear his throne and were depicted on the cover of the Ark of the Covenant. A Cherub was posted east of Eden to prevent human beings from returning and eating also of the Tree of Life. Satan, also called Lucifer, led a rebellion against Yahweh and was cast down from heaven to the earth with his host of rebellious angels. Two angels are named in the Bible: Michael (“like God”), warrior leader of the angelic hosts, and Gabriel (“man of God”), who interpreted Daniel’s vision. When sent as messengers, the Biblical angels appear as young men. Two other angels appear in the Apocrypha: Raphael (“God has healed”), guide of physicians and travelers, and Uriel (“fire of God”). Seven archangels are

mentioned in the apocryphal Book of Tobit, and in postbiblical Judaism, especially in apocalyptic literature, seven angels, sometimes called archangels, lead the heavenly hosts (First Book of Enoch).

Christian: Angels play a significant role in the New Testament. Gabriel announced the conception of John the Baptist to his father, Zacharias, and the conception of Jesus to Mary. Angels appeared to shepherds in the fields of Bethlehem to announce the birth of Jesus. Angels appear with Christ at the Second Coming and play a significant role in the Last Days described in The Revelation. Later Christian writers, particularly Pseudo-Dionysius and Justin, developed elaborate hierarchical schemas of angels, describing their roles and attributes. One such ranking consists of nine orders: Seraphim, Cherubim, thrones, dominions, virtues, powers, principalities, archangels, and angels. The nine orders are divided into three choirs, emphasizing the symbolism of the Trinity (3×3). The first choir contemplates God, the second governs the universe, and the third executes the orders of the superiors. Clement of Alexandria, under Hellenistic influence, thought angels control the course of the stars and the four elements (earth, water, fire, air).

Islamic: When Allah created Adam, he asked the angels to prostrate themselves before him, all did except Iblis (Satan). For this sin of pride, Iblis was banished from heaven and became the enemy of mankind. Angels revealed the Qur'an to Muhammad, who fearing he was possessed by jinn was about to throw himself off a cliff when Jibril (Gabriel) appeared and confirmed him as a prophet. Angels surround the throne of Allah, record the good and evil deeds of human beings, intercede with God on their behalf, escort the soul at death, reward the good, and punish the wicked. In Islamic tradition, there are four orders of angels: four throne bearers, the Cherubim who praise Allah, four archangels, and a host of lesser angels. The archangels are Jibril, the revealer; Mikal (Michael), the provider; Isra'il, the angel of death; and Israfil, who places souls in bodies and sounds the trumpet at the Last Judgment. Malik is the angel in charge of hell. In popular belief, there are also female angels, the *huris*, who

provide male Muslims with erotic delight in paradise (they are similar to the Hindu *apsaras*).

Commentary

From the Freudian perspective, angels are wish fulfilling fantasy creations of the protective, caring, and guiding aspects of the parental imago. As attendants and guardians of the male supreme deity, they represent aspects of patriarchal power. As messengers and intermediaries, they are internalized voices of parental authority and function as the superego, rewarding good and punishing evil behavior. The rebellion of Satan and his host of angels and their banishment from the deity's presence dramatizes the consequences of opposing the parental will. The Cherub with a fiery sword placed at the entry to the Garden of Eden protecting the Tree of Life refers to the patriarchal threat of castration and annihilation aimed at regressive incestuous impulses for a return to the womb. The "sons of God" who had intercourse with the "daughters of men" probably refer to the original band of brothers who killed the primal patriarch and usurped his sexual prerogatives. The angelic announcements of various Biblical conceptions is a "spiritualization" of parental sexual activity and perhaps an attempt on the part of both parents and children to see birth as a unique and special ("blessed") event.

From the point of view of Jungian psychology, angels are manifestations of the various characteristics and functions that belong to the transpersonal archetype of the self or are attributes projected onto it by human beings, e.g., power, protection, intelligence, narcissism, pride, and the source of life and death and of good and evil. As messengers, they represent attempts on the part of the self to convey information to ego consciousness that otherwise would not be understood or apprehended. Their manifestation in human form allows for an empathic connection and makes the messages they convey comprehensible to human beings. As intermediaries between the divine and human realms, angels are attempts on the part of the transpersonal unconscious to maintain a relationship with human consciousness and to

participate in the personal and temporal world. For example, it is noteworthy that angels prevented the sacrifice of Isaac, renamed Jacob Israel, appeared in the burning bush to Moses, announced the birth of Ishmael and of Jesus, and revealed the Qur'an to Muhammad. In *Genesis* (6: 2ff), there is mention of "the sons of God" who took "daughters of men" for wives and fathered children who "became mighty men. . . of renown." The divine or semidivine birth of a hero is a universal motif. It depicts, so to speak, the desire of the transpersonal self to have intercourse with the human realm and incarnate in the three-dimensional world. In strictly psychological terms, the motif portrays an impetus on the part of the transpersonal psyche to realize itself in ego consciousness. In this regard, the role of Satan (also called Lucifer, literally, "light bearer," Isa. 14–21) in the three dominant Western religions is significant. The banishment of Satan and his rebellious angelic host from heaven to the earth is also an incarnation motif. (The banishment to hell is Milton's poetic license and based on The Revelation where that occurs at the end of the world.) This "fall" of the angels precedes that of Adam and Eve and must be viewed as a preconscious foundation for the formation of a conscious human ego structure.

Anima and Animus

John Ryan Haule
C.G. Jung Institute Boston, Chestnut Hill,
MA, USA

Terms introduced by C. G. Jung to describe certain functions of the human "soul" (*anima*, Latin). *Anima* names the feminine unconscious factor in a man, while *animus* applies to the corresponding masculine factor in a woman's unconscious. Noting the frequency with which he encountered such contra-sexual figures in the dreams of his patients, Jung theorized that every individual is born with the potential for both sets of gender characteristics, but – under the influence of genes and socialization – only one set is developed consciously, leaving the other latent in the unconscious. Because dreams tend to "compensate" for an inevitable "one-sidedness" in conscious attitude, archetypal images of the opposite gender are common in dreams.

Gender Relations

Jung described the "masculine principle" as *logos* (the tendency to trust logic and verbal formulations) and the "feminine principle" as *eros* (the tendency to trust emotional connections and relatedness) (Jung 1959, p. 14). A logos-oriented man will undervalue relational skills and feeling values, including his own. In the unconscious, however, they have numinous power, for they belong to the archetypal realm of goddesses and

film stars. The situation with the eros-oriented woman is similar but opposite, with logos-characteristics numinous in the unconscious: male figures with fascinating verbal and intellectual qualities. When the two meet romantically, they tend to project their mythically idealized inner figures upon one another, making disillusionment inevitable when they discover that their partner is a poor match for the projection. When this happens, each partner will suffer from the limitations of the other's undeveloped side: the man's touchy, undifferentiated feelings and the woman's stereotyped thinking.

Ultimately, however, anima and animus are essential for psychological transformation, where the disillusionment of projection failure may become the beginning of wisdom. Unconscious contents become known when one catches oneself in the act of projecting them, and few opportunities to do so are as unmistakable and personally painful as erotic conflicts. With enough presence of mind to recognize a projection for what it is and "withdraw" it – in the sense of acknowledging it as one's own – one begins to become acquainted with anima or animus as unconscious potential. While an unrecognized contra-sexual archetype will draw an individual into one unsatisfying encounter after another, an anima or animus that has become known will function intuitively to supply the formerly missing perspective and complete an understanding of the world and of oneself. This integration of the contra-sexual archetype is known in myth as the hierosgamos (Greek for "wedding of the gods"). It leaves one more adequate for mature relationships and more capable of effective engagement with both the inner world and the outer.

Mediation: Ego and Self

Discussions of anima and animus that become fascinated with gender differences tend to overlook the fact that, at bottom, the anima/animus syzygy (or "pair of opposites") plays the same role in every psyche. It mediates between ego and "self" (Jung's name for the wholeness of our being, including both conscious and unconscious elements). The

oppositeness of their gender reflects their personification of an inner world that is largely opposite to and compensatory for limitations in the conscious attitude. The allure of anima and animus figures, whether seen in visions or in a flesh-and-blood partner, inspires interest in unknown aspects of self and world and mobilizes psychic energy, drawing the individual into life and opening up a deeper and more compelling inner world.

Always lurking behind anima and animus is the self they mediate. As the most powerful and significant force in the psyche, self is the God of one's inner world. From the psychological perspective, therefore, Tao, Brahman, Christ, Buddha, Atman, and the like are projections of the self, while from the theological point of view, the self is that aspect of the human psyche that God uses as the "dark glass" through which divine revelations are possible.

Religious Dimensions

The numinosity of the godhead is an essential attribute of anima and animus, for the mediator reveals the presence of the greater being and glows with its splendor. This is the reason mystics – historically, those who have published accounts of their experiences have been overwhelmingly male – typically speak of their love of God in erotic language; why in the Kabbalah the nearest *sephira*, or "sphere of divine manifestation," is the feminine Shekhinah ("Divine Presence"); why Rumi and many of the Sufis rhapsodize over a divine Beloved they experience as a supernatural woman who entangles them in her black tresses; why Roman Catholic nuns describe themselves as "brides of Christ"; and why devotion to Mary the Mother of God and to Muhammad's daughter, Fatimah the Resplendent, are so important in their respective religions.

Animal Spirits

Lee W. Bailey
Department of Philosophy and Religion, Ithaca
College, Ithaca, NY, USA

In bygone religions, beliefs that divinities could take animal form were common. Indigenous tribal shamans wore ritual animal masks, heads, and skins. This was because the world was seen as full of spirits – ancestors, ghosts, demons, and deities. Reincarnation meant that spirits, deities, and humans could easily appear in animal form. Ancient religions thus express empathy with animals. Empathy is a major factor in psychology and religion (Rifkin 2009). The Jungian analyst Andrew Samuels says:

The self is the primary source of phenomena such as empathy. ... Empathy is a form of psychological interpenetration, a deep link between people; the mother-infant relationship is both a special example of this and a model for empathy throughout life. (Samuels 1985, p. 99).

This is well recorded in ancient Egyptian religion involving animals. The original cosmic egg was laid by an Ibis. Thoth was pictured as a man with an Ibis head (Patrick 1972, pp. 22–23). The goddess Hathor took the form of a calf (the Hebrew Golden Calf) or a cow who nursed Horus. Isis wore a crown with cow's horns, disc, and a vulture (Patrick 1972, p. 33). Isis was known also as a kite, an eagle-like bird with large wings. Her son Horus appeared as a falcon (Patrick 1972, p. 39). The great god Ra is pictured as a falcon-headed human with a sun on his head (Ions 1965, p. 43). These symbols show a great deal of religious human-animal empathy.

Carl Jung wrote extensively of animals as archetypal, mythic images of human souls and their part in nature. He was very empathetic with people and nature (Jung 1979, Vol. 20, p. 247). He reminded us of the role of the dove as Diana, Mary, Aphrodite, and the Holy Spirit. He saw in dreams and myths many animals such as the fish as Christ and the butterfly as psyche. The serpent he saw in many dreams and myths was highly symbolic, full of unconscious mystery and fear. The mythical animals such as the resurrected phoenix, the unicorn that can be tamed when he lays his head in the Virgin's lap, and the shadowy Western dragon that must be slain are highly symbolic (Jung 1979, Vol. 20, pp. 57–75). The collective unconscious is full of animals. Externally, humans bond empathically with certain animals, living out unconscious archetypal dramas with them, from pampered pets as maternal baby images to galloping horses as ego's power images.

But on the other hand, the official scientific worldview rejects empathy, replacing it with "projection," for it has severed human "subjects" from nature's "objects," striving to break the human-animal empathetic bond. When Descartes and others postulated that animals feel no pain, for they are machines, this slammed the door to human-animal empathy (Rosenfield 1941/1968).

Most animals in the industrial worldview are now seen as beasts to be dominated or eaten, in a theoretically “objective” world wiped clean of spirits. Consequently, huge “factory farms” raise chickens, turkeys, cows, and pigs in crowded, filthy, and ruthless conditions, processed as part of the industrial model of factory “efficiency” without any regard for their feelings, needs, pollution, or place in nature.

Peter Singer wrote early critiques of this treatment of animals (Singer 1990). We are now seeing increasing criticism like this of this system as pollution, unhealthy for animals and humans, concealing costs to keep prices down, and cruelty to animals. Jeffrey Masson, a psychoanalyst, says that our eating habits cultivate a massive denial of the animals at the other end of the fork: “We want steak, but don’t want to hear about the slaughterhouse” (Masson 2009, pp. 15–16). One wonders whether we have relegated more animals to *sacrifice* for the abundance of food in industrial society. Should we *care* about all this? The question is important as world population grows and humans rapidly expand and destroy natural animal habitats.

Scientists are showing that there is a real threat of increasing extinction for many animals, due to problems such as habitat loss, toxic chemicals, and climate change. Many of these creatures are very important to the maintenance of earth for humans, such as keeping the soil and water capable of growing food. But we may be in the midst of the earth’s sixth mass extinction. According to one scientist, Richard Pearson, who wrote *Driven to Extinction*, an estimated nearly 20,000 species of animals and plants are at high risk of extinction in the wild, such as 25% of mammals, 13% of birds, and a shocking 41% of amphibians, such as frogs. Crucial functions of creatures are threatened, such as bees that pollinate food for us. The health food and animal rights movements are shifting collective consciousness toward more ecological, healthy low-fat diets, and less cruel treatment of animals. Does this shift in consciousness have a religious component?

Human empathy appears as we anthropomorphize or project our feelings on animals, as we do

for gods. But we must carefully distinguish between this artful play and accurate understanding. Children easily do this, loving and cuddling pets and enjoying books and films such as *The Lion King* about animals enacting human and animal dramas with archetypal themes such as the myths of Joseph, Moses, and Macbeth (Allers and Minkoff 1994). Mythic, artistic explorations show a great deal of empathy and projection of human feelings onto animals. But more empathetic scientific observation of animals is expanding our understanding of them much farther than before. Each species has its instinctive patterns, and once we get past our pattern of domination and understand their needs, abilities, ecological role, sensitivities, and feelings, we can interact better, see anthropomorphism as art, and increase our empathy and respect for their inherent value in cooperation with science. These psychological shifts could become ethical and spiritual commitments.

One voice for more empathy and respect for animals is Alexandra Morton. She worked with orca whales at Sea World but was distressed that the newborn calves died. So she turned to studying orcas in their natural habitat. She learned that each group has a female in the center of the pod, with her younger female relatives swimming around her. The males swim farther away and come in mainly to mate. But she saw that the newborn calves had to be shown where to nurse their mothers by the other females, since the mother’s nipple is concealed by a flap. She realized that without this social network, in a confined tank for human viewing, the newborns were not able to locate their food and thus died. So she left Sea World for an area in the Pacific Ocean off the coast of Vancouver, Canada, where Orcas gather. She respectfully studied and recorded them, and they did not flee her.

One day she and her husband took their son in their boat out to see the whales. Suddenly, they found themselves surrounded by fog, and, without a compass, they had no idea which direction to go home. This was dangerous. Then a number of orca dorsal fins surrounded them, all pointing the same direction. So they steered their boat in that

direction, and the orcas led them to their water-front cabin (Morton 2002, pp. 112–15). This is a remarkable example of animal empathy. Those huge orcas knew that she was not going to hurt them, they realized the trouble, they knew how to show her the way back home, and they *wanted* to help her. What does that say? If such dangerous animals have such empathy for humans, should we have more empathy for them?

Jeffrey Masson is a psychoanalyst who turned to studying animals. He tells the story that before he knew much about elephants, he approached one in their habitat. It spread its large ears out and charged him. Luckily he was able to run away and hide in the tall grass before being killed (Masson 1995, pp. xiii–xiv). So much for naively sentimentalizing animals. Obviously, it is essential to protect ourselves from animal attacks. After studying them, he learned the essential sign of a bull elephant attacking: it flaps its ears. Masson has now written nine books on the emotional lives of animals, exploring such feelings as fear, hope, love, friendship, grief, sadness, joy, rage, dominance, cruelty, compassion, rescue, shame, beauty, and even justice and a religious impulse. Humans and animals share a great deal psychologically, and perhaps spiritually, he shows.

Jane Goodall studied chimpanzees in Tanzania and wrote fervently against the behaviorist philosophy, which required numbering animals as if they were objects, not naming them, to avoid emotional involvement. But Goodall showed that animals do have feelings. She began naming the chimps. This was an important step toward a new empathy with animals. Goodall demonstrated that chimps have feelings – love, parenting, pouting, and many others. But she does not romanticize chimps – when she had her own baby at her jungle camp, she protected him from the aggressive male chimps by having him sleep in a cage (Goodall 1988, pp. 83–84). Yet she has high principles: rejoice that we are animals, respect all life, be humble, not harmful toward animals, learn from them, teach children to respect and love nature, be wise stewards of life, and value and preserve nature (Goodall 2002). These guidelines point to more empathetic, ethical, and spiritual relations to animals. Major Western religions have few teachings like this, but these views

are spreading. Now we know that human and chimp genes are about 98% the same (human) Goodall says:

... we are not the only beings with personalities, reasoning powers, altruism, and emotions like joy and sorrow; nor are we the only beings capable of mental as well as physical suffering (Goodall 1999, p. 93).

When Goodall came to the religious question, she knew that humans have the cognitive ability beyond chimps to articulate questions such as purpose in life. But then she turned to her nonverbal feelings about religion. After a visit to Notre Dame Cathedral in Paris, she wrote that the visit:

... helped me to realize that the spiritual power that I felt so strongly in the wild and beautiful world of the forest was one and the same with ... the days when I used to spend long hours in ancient cathedrals (Goodall 1999, p. 94).

Goodall got it. While we work on trying to understand animal communications, most of them are nonverbal. This means we have to change ourselves and increase our own empathetic abilities to read nonverbal languages. Rub a friendly horse's neck to show respect. Watch a flock of geese fly in formation across the sunset. These are moments when the spirits of both humans and animals can attune to our common wondrous spirituality. Through empathy, without superstition or sentimentality, perhaps we can experience the divine spirit in animals.

Animals in Yoruba Belief

Adewale Oluwole Owoseni
Department of Philosophy, University of Ibadan,
Ibadan, Nigeria

Introduction

Debates about the role of culture in psychological processes have sparked a movement in research that is directly applicable to social problems (Cooper & Denner 1998: 2). Speaking of social problems, issues or encounters in daily lives instantiated in the dialectics/struggle of social strata, identity crisis, beliefs, perception, consciousness, intentionality, preference or aversion, and so on that circumscribe the existential conditions of humans' interaction with the environment abound. The idea that engaging such problems occurs within individuated context, immersed at

large within the specificity of a sociocultural environment from which meanings, perceptions, or interaction are fashioned, is central to the crux of cultural psychology. This implies that the contextual meaning or perception of phenomena from human to nonhuman remains an inclusive subject matter of cultural psychology.

As Richard Shweder (1990: 1) notes: "Cultural psychology is the study of the way cultural traditions and social practices regulate, express, transform and permute the human psyche, resulting less in psychic unity for human kind, the study of the ways subject and object, self and other, psyche and nature, person and context live together, require each other and dynamically, dialectically and jointly make each other up". Efforts to signify the underlying cultural psychology of phenomena among group or intergroup relations from Western, to Asian, to African societies are thus widespread. With particular interest on the phenomenal conception of animals, this discourse focuses on the interconnection between psychological and religious conception of animals, with allusion to Yoruba (African) belief. The Yoruba (Southwest Nigeria) view of animals, which is underscored by religious, mythical, and superstitious relational beliefs that impact the psyche of perception about domestic animals, livestock, and wild animals, is considerably worthwhile of psychological analysis.

The extent to which this is conveyed in Yoruba culture and how this complements the prominent position in psychological circles regarding human-animal relations that often consider animals' status or role in terms of therapeutic utility for social bonding, alleviation of social skills, and others would be briefly explicated. Precisely, Yoruba belief of animals emphasizes that psychological considerations should not only focus on the essentiality of animal-assisted therapies and social support for human health, social skills, and well-being but also prioritize the imperative of environmental order/balance. In lieu of this, there is the need to outline the central issues implicated in this context that is the discourse on animals in psychology and the interface of the factor of religion, conception, and underlying cultural psychology of animals in Yoruba belief.

Animals in Psychological Discourse and the Interface of Religion

The notion of speciesism popularized in the Western thought of philosophers like Mary Midgley, Peter Singer, and Tom Regan among others takes on a different dimension or consideration in psychological parlance. While the philosophical consideration of this notion has been ethically and ontologically expatiated for the conception of rights, welfare, use, or worth of animals in discerning their status in activities like vivisection, farming/husbandry, companionship, food industry, and so on, psychologists have expounded the intricacies of species, interspecies, or conspecific bonding manifested in human and animal interactions. In this regard, concerted efforts to deploy psychological theories like attachment theory, contextualism, ecological systems theory, and dynamic system theory in order to analyze human and animal interactions within the context of domesticated or cultured environment to depict the perception, reinforced behavioral patterns and impact for human health/well-being, social skills, assisted therapy, species differentials and similarity, embodiment and experience, as well as agency among others have been engendered.

These plausible analyses are guaranteed on the conventional focus of psychology as the science or study of the activities of living things and their interaction with the environment (Harris & Levey, cited in Melson 2002: 347). In any case, the view that animals are a source of multimodal stimulation and attention that can certainly trigger the development of cognitive abilities is the core to psychological analysis (Grandgeorge & Hausberger 2011: 398). Importantly, psychological analyses of animals in this sense consider animals as specie-specific intentional bodies permuted by actions or activity, subjected to perceptual meanings resourced for paternalistic models of human and animal interactions. In this connection, the factor of religion is also relevant in discerning psychological discussion of animals along the lines of the thematic concerns of social skills, therapy, agency, and embodiment among others mentioned previously. For instance, Campbell (1984) expounded the substantiated role of

animals as companions and guides, assumed to possess powerful capacity due to invested animistic beliefs and practices as found among the Shamanic, Asian, Amerindian, and other indigenous cultures of the world. Similarly, Serpell (2006) implicated the place of spiritual traditions honored by the relationship of the people to animal farms as part of the natural world and as a link with the spiritual world. Other related studies on this matter include Dresser (2000), Lange (2007), Walsh (2009), and many more.

Oftentimes, these underlying religious persuasions of human and animal interactions are devised for symbolic meanings to moderate human activity (psychological processes inclusive) in the main. Legend, myths, folklores, and superstitious relational beliefs are mediums that inform the psyche of human-animal relations within such classified religious views. The tendency that the narratives of these mediums may differ across cultures is likely indubitable. This reenacts the view that a greater focus on cultural differences is imperative to truly advance a psychology of human-animal relations (Amiot and Bastian 2014: 31). In this instance, let us briefly consider the Yoruba belief of animals within the dynamics of human-animal relations and discern its cultural psychology and contribution to the discourse in psychological circles.

Yoruba Conceptions of Animals

Within the context of Yoruba culture, conceptions about animals (nonhuman animals) can hardly be severed from the religious cum ontological understanding of animal status. In this connection, Kola Abimbola (2005: 60) reveals that humans, plants, and animals occupy the same plane (Level 3) within the spherical globe of existential hierarchies of being, while *Ajogún* (evil/supernatural forces or anti-gods) and *Àjẹ* ("our mothers," often improperly accorded as witches) occupy Level 2; primordial forces, namely *Olódùmaré*, *Qbátálá*, *Ifà*, and *Èsù*, occupy Level 1, and the ancestors occupy Level 4. The point here is to hint that the ontological place of animals among the

Yoruba can hardly be severed from the dynamics of relation with all life-forms (the hierarchy of being). Ajibade Olushola (2006) has aptly signified that in Yoruba view, the conception of animals is guided by taxonomical and physiological considerations (*eran omi*, aquatic animals; *eran elèsè méjì*, bipeds; *eran igbó*, wild animals; *eran afàyàfà*, reptiles; etc.), associated taboos, songs, chants, and panegyrics that influence relations with animals in the farmstead, homestead (like dog and hen), or wildlife (buck/deer).

Extending this view, Raymond Ogunade (2004) and Sikiru Adewoye (2007: 54) exemplified how taboo-induced injunctions in Yoruba thought enhance environmental conservation that impact relations with animals such as buffalo (affiliated with water source in allegiance of the goddess *Oya*), dog (affiliated with avoidance of peril, disasters, or environmental accident in allegiance of *Ògún*, the god of metallurgy), vulture (*igún*), and yellow palm bird (*eyẹ – ògà*) accorded for their potency to spur environmental degradation/destruction or famine in the land.

Owoseni (2014) further expounds the ethico-cultural conceptions about the dynamics of animal-animal relations and human-animal relations, indicated by Yoruba oral tradition, superstitious relational attitudes, and practices devised for anthropocentric ends and other motives (food, social support/security, species survival, worship, conservation, etc.). These outlooks are not lacking of the compliment of cultural psychological undercurrents due to the models of signified relations in the conception or beliefs about animals as companions, self-objects, and embodied agents represented in Yoruba thought, though not yet fully articulated.

Yoruba Belief and Cultural Psychology of Animals

In line with the above, there is a suggestive stance that despite the overt manifestation of invested religious beliefs informing the conception of animals as symbolic entities among the Yoruba, animals are considered as modal or interactive agent(s). In other words, they are accorded as self-objects. This

is implicated by the psyche of commitment to the ontological essence of the animals (as in the case of the dog, yellow palm bird, or buffalo hinted earlier) in Yoruba thought. And this is propelled by precautions (taboos and oral traditions) proscribing undue interference or relations with animals that could disrupt the social support system or spur environmental imbalance. Precisely, animals in Yoruba belief are not limited to the decimated model of “means” for companionship, assisted therapy, social support, human health, or well-being. Animals in this sense are conceived as mirror self-objects (see Schaffer 2011) through the medium of religion on the basis of the acceptance of animals’ status and role as interactive agents or species. This implies that the general psychological effects of contact, relations, attachment, and modelling would need to take cognizance of cultural particularities of human-animal relations, as exemplified in Yoruba conception or belief about animals. Hence, cultural peculiarities should be considered as a strong moderator of human-animal bonding and interspecies dynamics in psychological analysis.

Animatism

Kasi Eswarappa and Gladis S. Mathew
Department of Tribal Studies, Indira Gandhi
National Tribal University, Amarkantak, Madhya
Pradesh, India

People are attracted to various forms of religion because it provides believers the opportunity to satisfy all their fundamental desires over and over again. Religion is a social term, but worship includes emotion and mind. Psychology primarily deals with the self, mind, and emotions. It also deals with the personal identity, selfhood, memory, subjectivity, consciousness, motivation, cognition, and belief patterns. The primary focus of the psychological approach to religion is the study in which religion operates in the mind of the individual. The relationship between religion and psychology clearly includes the study of religious

belief and behavior from a psychological perspective. The psychological study of religion includes a focus on both religious behavior and religious beliefs and uses various models of human nature.

Animatism is also a form of religion in most of the primitive or preliterate societies, which speaks about a belief in generalized, objective power over which actions of control can be imposed by the people.

Animatism and Religion

Religion upholds a belief in powerful mystic beings with individual identities and familiar traits. One of the most important elements of any religion is the belief in the supernatural power. According to Edward Burnett Tylor, one of the founding fathers of anthropology, the minimum definition of religion is the “belief in spiritual being.” There are various forms of religion in every society.

According to Linda Woodhead (2011), there are five major concepts of religion which discuss about the epistemological engagement of religion on the one hand and its concomitant influence on the disciplines such as psychology on the other.

In the very first concept “religion as culture,” Woodhead discussed that sometimes the content of belief, in a way, is further specific in the definition of religion (i.e., the existence of supernatural beings or force). In the same way, she also quoted that Geertz supported Berger in developing a more complex account of culture. Culture, for Geertz, is made up of interconnected myths, rituals, symbols, and beliefs, which together form enacted and embodied systems for making sense of the whole of life.

In the second concept “religion as values,” Woodhead portrays to bring parity between Parson and De Tocqueville’s conception of religion. They also consider values to be a central social significance and both viewed religion as a sphere of sacred values. Tocqueville also mentioned about the “mores” which means the different notions possessed by men, the various opinions that exist among them, and the sum of ideas that

shape mental habits. So, the value covers the whole moral and intellectual state of a person.

The third concept is “religion as discourse,” and Woodhead argues that many scholars believe that religion is embedded in language and, above all, in narratives. The vagueness of the concept of “discourse” can be both a strength and weakness of such discourses and approaches. The discourse of religion is narrowly interpreted; it may have the effect of reducing religion to language and to articulated statements, so reinforcing a logocentric tendency which comes naturally to academics.

The fourth concept is of “religion as identity,” which tries to represent an epistemological engagement of religion and its vicissitudes in the disciplines of social sciences. Many scholars believed that religion is a matter of creation and maintenance of social bonds rather than primarily a matter of belief or culture. According to Durkheim it is closely associated to sociological tradition. Religion is the place where a society holds up an image of itself, reaffirms its bonds, renews its emotional ties, marks its boundaries, sets itself apart, and so brings itself into being.

The final concept is “religion as tradition and memory,” and Woodhead curtly discusses about religion what other schools of thought portrayed to discuss, experiment, engage, and interpret in different nuances of sociological realm. She further says that a different approach to distinctiveness is offered in order to present religion as a tradition. A few other scholars such as Halbwach, Hervieu-Leger, and Grace Davie recognize religion as a “form of memory.”

Animatism is a belief that inanimate, miraculous qualities exist in the natural world. It also talks about the belief that everything is infused with a life force giving each lifeless object personality or perception, but not a soul as in animism.

Edward Burnett Tylor described, in the year 1871, animism as a form of religion, which is mainly used by the primeval or early people. He also stated that the early human beings personify almost all the things of the universe with inanimate power. His concept of animism mainly speaks about the mystical force and soul, both lifeless, which is responsible for giving life to all the

animate beings on this universe. In an extension to the concept of “animism,” the British Social Anthropologist Robert Ranulph Marett coined the word “animatism” in the year 1900. He used this word in his book *The Threshold of Religion*. The word “animatism” is derived from the Latin root “anima,” meaning soul. Marett opposed the concept of E. B. Tylor’s animism, and he postulated an impersonal religion, or “animatism,” based on “awe,” a feeling of “submissiveness tempered with admiration, hopefulness, and even love.” Marett further explained that in some of the cultures, people, plants, animals, and lifeless objects were gifted with several supremacies, which were both mystic and detached.

Animatism and Belief Patterns

Animatism is a widespread belief especially among the Polynesian culture of the South Pacific. They use the term “mana” to explain animatism in a different way. According to Marett, “Mana” is a concentrate form of animistic force found within any of the objects that deliberate success, strength, and power. The word Manaism is derived from the Melanesian word “mana” which speaks about the objective, supernatural form linked with persons or certain objects. The Melanesians see stone also as *mana* many a times. They believe that if the stone is in an abnormal shape or resembles the shape of a pig, then that object has a supernatural power. They place that stone in pigsty as they believe that the stone being mystical in nature has the power to multiply the pigs and keep them healthy. On the very other hand, Alaskan Eskimos also believe that glaciers are living bodies, which act as an obstacle in their path. To avoid natural calamities, they also perform some sacrifices to overcome the hindrances caused by nature.

Melanesians also associate Manaism with human beings. Further, they believe that their chief owns the *mana*. It is also suggested that the common people should not go near to the chief as if they do so the chief’s *mana* has the power to annihilate the commoner. It is also said that it can be either benevolent (kind and friendly) or

malevolent (evil and bad) in nature. The benevolent soul is also known as right-hand soul, and the malevolent soul is known as left-hand soul according to the Bagobo tribe of the Philippines.

According to many scholars of anthropology, belief in mana is the beginning of the religion. The concept of Bongaism among the Ho tribe of India is similar to Marett's theory of early religion. According to them, Bonga is a generic term and is applied generally, referring to God or spirits. It is believed that the Bongas are non-anthropomorphic in nature and do not appear as an object but took the medium of dreams to foretell. They also believe that daydreams also forewarn about evil things to them. It can be found in other major tribes of India like Santhal, Munda, and many more.

The beliefs in inanimate things are very common in most of the primitive societies. Animacy may be credited to spirits dwelling in objects or, in some phenomenon, is viewed itself as a life force. The famous sociologist of the twentieth century, Emile Durkheim in the year 1912, examined totemism as the oldest and purest form of religion. In many of the tribal or indigenous societies, people have the concept of "totem." According to Prufer (2006) totems connect human societies to the surrounding world and allow humans to construct social hierarchies that mirror those observed in nature. Totems can be inanimate objects, living beings, or some forces like the sun, moon, wind, or thunder. James Frazer came up with a classic definition of totemism and explained that it is an inanimate relation which is supposed to exist between a group of family members on the one side and a species of natural or artificial objects on the other side. In operation, a totem is generally considered as a taboo to the clan members. As a rule they don't destroy or consume the totem, and they also not allow others to destroy their totem in any way.

Further, for Prufer (2006) most of the anthropologists have commonly used these early terms to discriminate between divine beings with distinct personalities (animism) and impersonal mystical forces (animatism). But in most of the societies, there is not a distinct difference between

the personal and impersonal forces. These theories are difficult to take seriously nowadays.

In his seminal writing of *Belief, Language, and Experience* (1972), Rodney Needham, the British Psychological Anthropologist, tries to explain his own assumptions about psychological language and psychological concepts by taking belief as a case study of analysis.

Due to modernization and McDonaldization, we can see the various changes in the forms of religion, and the early form of religion can only be observed among some of the primitive societies existing even today in different parts of the globe. As a theory, Marett's animatism does not stand in total isolation, in spite of its splendor, effect, and popularity. Ideas of conjuring up the superhuman figures are ancient and not found in the present era.

Animatism and Psychology

Religion offers resources for coping with fear. According to Goldenweiser (1917), the theory of naturalistic scholars like Max Muller, Kuhn, and others explains that nature is itself responsible for religious sentiment. The theory of animatism makes an attempt to analyze religious consciousness and to interpret its nature psychologically. In animatism the emphasis is shifted to the emotional side. We can also see that religion is "congregational" and is treated sociologically many a times.

Most of the tribal or indigenous people around the world still believe in animatism and practice it because they think that everything which is helping them in leading their life on this Earth is priceless and a piece for worship. They get emotionally attached with that object, and they believe that the object possesses some supernatural power which will keep them away from the evil eye. These nonliving things also help indigenous people in many ways. Any object which is useful to the tribal or indigenous people in their day-to-day life course has a great value in their lives. They believe that the nonliving things which are useful to them have some mystic powers and are sent by God on Earth for their help.

The primitive people also believe that if they do not worship the inanimate objects properly, the object may vanish from their surroundings, and they won't be able to get that object again in their life. This notion of fear and respect leads the tribal or indigenous people to worship the object in every phase of their life such as birth, puberty, marriage, and death. Worshipping inanimate objects gave tribal or indigenous people an assurance that they will be protected and blessed all their lives. The belief in inanimate objects also shows that the tribal or indigenous people not only respect living creatures but also respect the lifeless things on this Earth which has supported them in sustaining their life on this planet. This also indicates love and respect for nature and objects around them, which is missing in modern societies or so to say in advanced societies of the contemporary world.

Animectomy Complex

John Eric Killinger

The Intermundia Press, LLC, Warrenton,
VA, USA

Terminology

Term coined by American psychologist William Herbert Sheldon, Ph.D., M.D. (1898–1977). Though better known for his theory of and work with somatotypes, Sheldon wrote a book on a psychological approach to religion, education, and medicine entitled *Psychology and the Promethean Will* (1936). Despite demonstrating the influence of William James, the book appeared soon after Sheldon's pilgrimage to Europe in 1934–1935 where he studied the psychophysiological work of Ernst Kretschmer, conversed with Sigmund Freud, and spent considerable time with C. G. Jung discussing the theory of psychological types. The “animectomy complex” was coined not only “in good-natured appreciation” but also for “poking good-natured fun at” the Freudians for “their utterly delightful castration complex” (Sheldon 1936, p. viii, 200).

Sheldon asserts that the word “animectomy” follows in the somewhat “vulgar” practice in medicine to mint neologisms from an admixture of Latin and Greek terms. In this case, the Latin *anima* (soul) is paired with the Greek *ectomy* (cut off). Sheldon's definition of animectomy is “amputation of soul.” His primary concern seems to have been that psychology, if it already had not done so, was in danger of losing its soul, a fact echoed in the last several decades by John Sanford and James Hillman. That Sheldon should compare his neologism to the Freudian castration complex is interesting, for animectomy literally means “castrated soul.” The Greek *ectomy* derives from ἐκτομάζω (*ektomazō*), *I castrate, cut off, excise*, and it is occasionally used to refer to the circumcision of women. Unlike the castration complex, however, the animectomy complex is “merciful and fatal” (Sheldon 1936, p. 200).

Diagnostically, the animectomy complex is dissociation from feeling-awareness, in other words, the soul. For Sheldon, *soul* means oneness, unity, union between inner wish and outer reality. In his psychological theory, Sheldon mapped out five levels, or panels, of consciousness, the lowest being that of material relations (economic consciousness) and the highest being feeling-awareness or aesthetic consciousness. It is a dissociation from this highest panel consciousness that constitutes his animectomy complex, a dying back of the brain.

In other words, what Sheldon refers to is neither a physiological or anatomical construct nor is it a metaphorical reference to regression to the reptilian brain. Rather it is a kind of complacency on the part of human beings who find it easier not to see and feel simultaneously a meaning and thus truly perceive and understand the world. This is not *Psychodaiktes*, the epithet of Dionysos as destroyer or killer of the soul. Neither is it *psycholethros*, the death of the soul. The animectomy complex is the end or loss of aisthesis in a person's life, and it is with this loss that Sheldon is concerned and that he opposes with the need of Promethean will.

Influences

Sheldon's (1936) work is influenced perhaps more by Jung's *Psychological Types* (1921/1971) than he admits. Both draw from similar resources, including Carl Spitteler's prose epic, *Prometheus and Epimetheus* (1881/1931). In the long run, Sheldon's view is that if we continually practice routing out conflict and/or error, we will ourselves undergo an animectomy complex. We need conflict. In fact, it would even seem that we need error, too, in order to function and grow into the level of aesthetic feeling-awareness, to grow into soul to the extent that in order to understand what suffering others are experiencing, we need to experience or undergo something of an amputation/castration/circumcision of soul. In other words, it is suggested we pass through a symbolic dismemberment – if not death – that encourages, permits, and fosters

psychic rebirth. This is related to the *Ascent of Mt. Carmel* and *Dark Night of the Soul* of St. John of the Cross from a religious vertex. From a psychological one, it is also related somewhat to what W. R. Bion has termed the experience of O, the godhead or the unknowable ultimate reality that is an existential difficulty that must be passed through as a *rite de passage*, a *communitas* in its own right, in order to experience psychic rebirth.

There is something to be said for the experience of a psychic death in order to reap the benefits of a rebirth of wholeness within the self. In fact, Lawrence Staples (2008) in his book *Guiltwith a Twist: The Promethean Way* suggests that we must eat the forbidden fruit and bear guilt if we are to grow, steal the fire, and accept the punishment for bringing its knowledge to others. Again, this goes straight to Bion's differentiation between "knowing about" and "becoming *being*" in his discussions concerning O. Bion argues that from the start, we've had this injunction from the deity in which thinking and knowledge (K) is forbidden. This is precisely what Jung was looking for in *Psychological Types* and Sheldon in *Psychology and the Promethean Will*. One could use the analogy of the computer reboot, even a complete shutdown and restart.

Polemic, Prosthesis, and Reconciliation

Sprinkled throughout *Psychology and the Promethean Will*, as well as given a fair-sized portion, is somewhat polemical writing on what Sheldon terms "waster culture"—loud, monotonous music; art that fails to transform the beholder (one thinks of similar mild fulminations in Castoriadis (1999/2007) with regard to art and institutions in this vein); and philosophy that has lost its brotherly love for wisdom. Today such waster culture is apparent in the proliferation of MP3 players, text messaging, multitasking cellular telephones, gothic and other subcultural pursuits, and reality television programming. If anything, Sheldon's polemical style is meant simply to

grab our attention and shake us out of uncritical apathy, much as Freud (1913/1950) attempted to do with his critiques of the caricature of religion, art, and philosophy.

If an animectomy complex is, as Sheldon defines it, a repressed fear of the amputation of soul, then reparations via psychology would be mere prostheses, attachments, or applications via proposition and projection. The cognate of prosthesis, *prothesis* (placing in public), is not quite helpful either, for this would perhaps lead to the individual's melting or dissolving back into the collective slipping into repression or unconscious, what Sheldon, following William James, called the dying back of the brain.

As to a sense of psyche as psyche becoming unconscious, Slater (2008) draws our attention to our predilection for keeping psyche at bay, which he notes is a "dislocation of psychic disturbance from psychic ground" (2008, p. 352). The animectomy complex is psychic numbing, absencing feeling-awareness, or aisthesis, in the face of suffering and trauma – in short, dissociation.

Even if one were to experience this "animectomy complex" as Sheldon suggests analysts do, this very well could be akin to Giegerich's (1988/2005) call to sublimate our psychologies at the risk of crossing the threshold into madness. The amputation of soul, let alone its loss, is a caricature of psychology inasmuch as Freud (1913/1950) suggests that obsessional neurosis is a caricature of religion, hysteria is a caricature of art, and paranoiac delusion is a caricature of philosophy. The point being that amputation or castration of soul pushes us into critical thinking about the place of psyche in psychology. Psychology must show itself the barriers on which it can exercise its liberating power, thus doing more to help it to a better and more critical understanding of itself.

John Sanford (1929–2005) has articulated the disappearance, indeed the amputation of soul, from psychology. "Look in any dictionary or encyclopedia of psychology and see if there is a definition of *soul*. If there is one, it will only be a perfunctory one. The soul has gone out of modern

psychology... almost" (Sanford, personal communication, October 11, 1992).

It is a valid point. Even Hillman and Ventura (1992) argue that in the 100 years since its inception, psychotherapy is not helping to improve our world. Their critique occurs only because psychotherapy demands, even wants, at least a questioning, at most a hearing. The overstimulated postmodern information age in which we live seeks instant gratification, band-aids, less infrastructure, and pills and elixirs to cure one's ills and ailments. Depression, for example, is no longer the purview of the exponents of the talking cure; instead, we are continually bombarded with televised messages and magazine advertising sponsored by drug companies, insurance firms, and their lobbyists, who do not want time spent working through depression but rather desire the process sped up with medicines because depression is now considered a medical problem rather than a symptom of repressed psyche.

We face the problem of continuing horizontal splitting of psychology into cognitive, behavioral, neurological, abnormal, and the like, let alone within traditionally recognized Freudian, post-Freudian, Jungian, and post-Jungian psychologies. We suffer an over-willingness to medicate, due in part to this horizontal splitting. Perhaps in certain instances whereby the working through complex psychological issues in such a climate of overstimulation and rapidly advancing technology, medicines are not only useful but necessary; however, they are not the panacea the consuming public is proffered. The medicines do not help us arrive at the core or root of the problem. In all this over- and understimulation (or its deadening/numbing), there seems to be an eradication of time for reverie, reflection, meaning-making, and myth building required to make the journey toward wholeness. It would seem that the hearty endorsements of insurance companies to use more drugs than long-term "talking cure" therapy are only prostheses for amputated souls, and there is very little hope for castrated psyches, if this indeed is the impetus of meaning intended by Sheldon.

Perhaps what is called for is a reconciliation of the differential aspect of the promethean and the regenerative aspect of the epimethean. In this way, one progresses away from dying at the back of the brain (the comfort zone of merely knowing about) toward the aesthetic of becoming being. It is psychologically legitimate to accept a criticism of psychology as a negative of the negative in order to present a true positive, not unlike the Hegelian *Aufhebung*, but mere distinction between horizontal splitting of the field and its caricature in public and private practice leads to nothing more or less than further nonobservance and repression of psychic phenomena. Even if it is perhaps good to put into practice the idea maintained in the apocryphal book of the Old Testament known as Ecclesiasticus (Wisdom of ben Sirach) that leisure is necessary for the development and praxis of wisdom, we do well, as Jesus ben Sirach does, neither to discount nor dismiss and marginalize those for whom dying at the back of the brain is in fact their rightful function and place in life.

The animectomy complex presupposes that we no longer throw our hat in the ring with the notion that the gods have become our diseases. If these gods are in fact no longer *absconditus* but *absentia*, what happens to the voice of the symptom? Is it forever cast heroically into the darkness where there is wailing and gnashing of teeth, or have we simply lost the ability to deal with the amputation of soul from a vertical perspective? In other words, without Eros there is no Psyche. Without symptom there is no divisibility. Without divisibility we suffer from the dying back of the brain.

So we need the courage to realize the unavoidable necessity of the death to be died by our frame of mind (Giegerich 1988/2005, p. 230). It is this that mellows us so that rebirth of the aesthetic panel might occur.

Animism

Lee W. Bailey

Department of Philosophy and Religion, Ithaca College, Ithaca, NY, USA

A Modern Tool: Tylor

“Animism” is not a religion. It is a theoretical construct that attempts to explain a wide range of religious beliefs and practices. It is a modern concept, a by-product of the theoretical dualistic division between subject and object, grouping together religious beliefs that breach or confuse

that division. Originally defined as the erroneous attribution of life or soul to inanimate objects by primitive people, “animism” was developed as a major category in “primitive” religions, a “minimum” definition of natural religion by E. B. Tylor (1832–1917) in his 1871 six-volume, *Primitive Culture*. Today a “new animism” is developing along quite different, more ecological lines.

Traditional beliefs grouped under this concept originally included the view that a person’s or animal’s shadow, breath, blood, liver, heart, or eye holds their soul. Animals have souls, and all of the earth and sky is full of souls. Some are reincarnated ancestors, some are friendly spirits, and some are hostile ghosts. One’s shadow-soul could be devoured by a crocodile. Eating an animal’s liver could transfer some of that animal’s qualities to you. Animals or things seen in dreams or visions are believed to have souls. At the moment of death, the eerie experience of seeing a life turn into a corpse suggests to many the departure to an afterlife of a soul (*anima*) that once animated or gave life to the body. A tree may be seen as requiring placation before it can be cut, since it has a soul. Stones and gems may have souls. Ghosts and spirits of the dead are believed to populate the world and need magic, sacrifices, or food to keep them alive or satisfy their potentially dangerous tendencies, such as revenge for a wrongful death. The ontological sources of the world, such as “Mother Earth” or the origin of a species of life may be perceived as souls in the world. Tylor contrasts animism, in which the soul is the origin of life, with materialism, in which matter is the origin of existence (Tylor 1871, I: 453).

Evolution of Religion

Tylor argued that animism is the childish, primitive, lower, savage origin of all “higher” religions, in his scheme of the evolution of religion from an amorphous animism through more differentiated polytheism to anthropomorphic monotheism, all at war with science. R. R. Marrett, in his 1909 *The Threshold of Religion*, proposed an even earlier phase of undifferentiated “preanimism” or

“animatism” (similar to electricity) that preceded animism. This reductive evolutionary scheme, promoted by others, such as Charles Darwin and Herbert Spencer, was often implicitly or explicitly seen as part of the August Comte’s 1822 positivist attack on religion as an early phase of illusory beliefs he called “fetishism,” that theoretically faded away in the triumph of rational modern science. Arnold van Gennep in 1909 called it “dynamism.”

Metaphysics

Tylor and others presented their schemes as “laws” of science, but they were heavily laden with metaphysical assumptions. When Tylor speaks of animism as “extranatural interference and causeless spontaneity” (Tylor 1871, I: 3), he assumes that we know completely what nature is and what it excludes. When he speaks of “inanimate objects,” he is picturing the world through the Cartesian lens of the subject/object metaphysic. Speaking of “cause,” he assumes that this is a universal principle that is omni-explanatory, and religion is a cognitive error. This is heavy-duty metaphysics, inflated by the narrow horizons of nineteenth-century positivist confidence in science. It is a nexus of a major ontological feud between archaic cultures and modern industrial society. Believing that souls inhabit the world outside human minds is essential to “animism,” and believing that *no* souls inhabit the world outside the human mind is essential to the scientific worldview.

Attempting to make sense of the reports from cultures newly discovered by European global travelers, Tylor’s theory of animism did explain, for example, that funeral rites requiring the deaths of the wife, weapons, food, and servants of a powerful man had some crude form of reason and practical value. Within their worldview, all these souls [*animae*] were going to heaven to serve their master’s soul. But to Tylor this kind of reason was finally subjective superstitious nonsense to be disposed of by the presumed progress of new scientific knowledge and more advanced races’ higher morality that respects human life.

Survivals

Taylor was Oxford's first Professor of Anthropology when he retired in 1909, but his assumptions were soon eclipsed by more functional anthropology, which stressed social functions of religion rather than evolutionary progress, and psychoanalytic psychology, which saw the unconscious and symbolic side of archaic religions, rather than the early rational, practical side.

Taylor did see that animism survives in modern times, both in indigenous people's tribal customs, such as sun-worship and divination, and in "higher" cultures' superstitions, such as medieval witchcraft, spiritualism, and games of chance. He believed, as did many, that contemporary "savage" practices are survivals from archaic times, so they allow us to reconstruct past animism. But Taylor was generally criticized for seeing archaic religions as too intellectual and rational, rather than emotional and intuitive.

After René Descartes proclaimed "I think therefore I am," which helped shove previous intuitions of "animist" soul-in-the-world aside as subjective irrationalities, these intuitions were sometimes happily dismissed as superstitions and sometimes retained as mystical phenomena. The Romantics kept open a peek at soul-in-the-world. Nineteenth-century spiritualists maintained communion with what they saw as departed souls still in the world.

In the shadow of apparently triumphant industrialism, some contemporary indigenous people still hold to the archaic ontology when they say things such as "that mountain has spirit . . . ask Mother Nature to spare you some meat . . . worship the land, the ground and the stars and the skies, for they are the ones that have spirits. They are the mighty spirits which guide and direct us, which help us to survive" (Trimble 1986, pp. 24–47). Some cultures, as in Asia, still believe that eating a shark's fin, rhino's horn, or tiger's penis, for example, can transfer some of that animal's soul – aggression or sexuality – to you at dinner. "Bush meat" from African monkeys is still prized at some European restaurants. This demand is the source of ongoing bloody damage to wild animals. Children's teddy bears, pets, and toys

and people's homes and hometowns may be said to have souls. Such enduring childish or "primitive" practices indicate that the nineteenth-century evolutionary scheme that attempted to leave "animism" in the dust of developing rationality in technological cultures was not as triumphal as some believed.

One might detect elements of animism in major religions. Anthropomorphism in general contains elements of animism, seeing generalized numinous powers as persons. In Christianity, the incarnation of Christ could be seen anthropomorphically as an embodiment of the religious instinct. Seeing certain literalist beliefs as the devil may be seen as animist. Seeing gods as fathers, mothers, animals, or any earthly form may be seen as a form of animism. Statues, icons, paintings, dancers, and all the many ways that spirituality is embodied may be seen as animism today. The Eastern Orthodox Christians have made a refined distinction in their debates about the presence of the divine in icons. The "essence" of God cannot be known in an icon, but the lesser "energy" of the divine may be felt. Giving spirits "spirit houses" as in Indonesia or setting out rice balls as food for ancestors in a domestic shrine in Asia is animist. Animism survives, however refined, today, but not without continuing opposition.

Depth Psychology

Modern depth psychology has also edged toward the perception of souls in the world. On the one hand, it helped rationalism strip the world of soul with its important theory of "projection." This theory describes well how we all see out in the world what is actually rooted in unconscious dynamics. Sigmund Freud borrowed this concept from nineteenth-century culture, where theatrical *Camera Obscurae* at carnivals frightened people with tricks making pictures or actors seem to be spirits hovering in a dark room (Bailey 1988). Similarly the "magic lantern" (now called the "slide projector") was widely used by traveling performers to astonish and frighten people across Europe (Bailey 1986). Ludwig Feuerbach used the concept in 1841, saying that "The personality

of God is nothing else than the projected personality of man" (*Die Persoenlichkeit Gottes ist die entäusserte Persoenlichkeit des Menschen*) (Feuerbach 1957, p. 226).

The key German word "*entäusserte*" translates "externalization," not "projection," but Feuerbach's English translator George Eliot used the term "projection." So when Freud adopted the concept in 1895 (the same year that the movie projector was invented by Edison and others), "projection" became a strong psychoanalytic image for withdrawing soul from the world, while it helped patients discover their inner lives rather than imagine their souls only in the world. While a healing concept, it also helped strip the world of animism and soul.

Sigmund Freud

Sigmund Freud opened psychology up to the meaningfulness of the unconscious psyche as a healing factor, and the importance of symbolic language for psychology, but he retained key elements of nineteenth-century materialism, such as the subjective interiority of the psyche, dynamics such as projection, and the view of religion as an infantile illusion. In psychoanalysis, the transference/countertransference relation in therapy has evoked much heated debate about the presence of crude, infantile, refined, or even transcendent presences in the analytic container. Some see it as a necessary element in therapy, others do not. Some allow for it to become actively erotic, others do not. But it is at least analogous to animism in its unconscious perception of psychological and spiritual dynamics in the analyst-client interaction field, sometimes infantile, sometimes shadowy, but rarely missing in such an intimate alliance, for it provides an externalization of key unconscious dynamics to be worked out, as animism does in religion.

Carl Jung

Carl Jung adopted many of Freud's psychoanalytic discoveries, such as the meaningfulness of the unconscious psyche, but rejected Freud's

focus on sexuality as central and his denigration of religion. He also opened his "archetypal" depth psychology, however hesitantly, a step further toward "animism." First, Jung developed his theory of the collective unconscious, which moved psychology out of a narrow subjectivism. This expanded the psyche into a deeper and wider sense of soul in the human community and history. He also elevated mythology to a symbolic language of the collective unconscious, giving traditions such as alchemy a positive meaning denied since the Enlightenment. He also showed how myths and dreams echo each other, both coming from the collective unconscious. A key therapeutic practice is to take the motifs of a dream (e.g., virgin girl) and search for parallels in archaic myths (e.g., Virgin Mary), thus amplifying and externalizing its meanings with historical and anthropomorphic depth.

After Jung's transforming near-death experience in 1944 (Jung 1961/1971), which opened him to a more cosmic sense of the soul's journey, Jung became even more mystical and worked on uncovering the deeper meanings of traditions such as alchemy. The ancient and medieval alchemists wrote about transforming base materials such as lead into treasures such as gold, and Jung realized that they were talking in code language about their own soul transformations, for example, transforming depression and death into a treasure, the "philosopher's stone." These were in part "projections" from their inner lives onto outer matter, but Jung shifted closer to "animism" and religion. In the alchemist Khunrath he reads: "It is the Aqua Permanens, eternally living." "The 'radical moisture' is animated . . . by a fiery spark of the World-soul, for the spirit of the Lord filleth the whole world" (Jung 1963, *CW* XIV: para. 50).

Jung concluded his extensive alchemical explorations with the term "*mysterium coniunctionis*," meaning "Everything that happens, however, happens in the same 'one world' and is a part of it. For this reason events must possess an *a priori* aspect of unity, though it is difficult to establish this by the statistical method" (Jung 1963, *CW* XIV: para. 662).

Although Jung sought to retain his Kantian subject/object epistemology and his role as

scientific psychologist rather than theologian, toward the end of his life, he repeatedly tiptoed across the border between subjectivist psychology and a mystical sense of the oneness of the world (*unus mundus*) that allowed for a refined “animism” and religion.

Jung also saw many archetypal constellations, as between parents and children, as forms of participation mystique, Lucien Levy-Bruhl’s term for Jung’s sense of the wholeness of archetypal collective attractions, repulsions, and identifications as with tribe, society, religion, or nation. “The all-embracing womb of Mother Church is anything but a metaphor, and the same is true of Mother Earth, Mother Nature, and ‘matter’ in general” (Jung 1963, *CW* X: 64–71).

One form this paradoxical struggle took was Jung’s concept of synchronicity or “meaningful coincidence,” outside the narrower laws of causality, such as extrasensory perception, clairvoyance, or precognition. Once a patient was discussing a dream of a golden scarab (a symbol of rebirth), and at that moment, a very similar scarabaeid beetle (rose-chafer) flew to the window (Jung 1963, *CW* VIII, 843).

Jung’s critics call these explorations ‘mysticism,’ and in them one might see elements of “animism.” The later Jung did acknowledge that he stretched the boundaries of modern science. However, the many mysteries in areas such as physics’ subsequent explorations of dark matter have become the topics of postmodern questioning of the certainty of science, for which Jung was a precursor. Moreover, Jung never lost his strong ego and ability to step back and analyze the mysterious depths of soul-in-the-world that he uncovered.

James Hillman

Of Jung’s successors, James Hillman pressed forward the issue of soul-in-the-world farther. In *Revisioning Psychology*, Hillman devotes an entire chapter to “Personifying or Imagining Things,” where he criticizes the subjectivist view of defensive projections “out there” being withdrawn back “in here” and seen as merely fictional

or imaginary, understandable only for the irrational: children, primitives, or the insane. He challenges this metaphysical assumption pervading psychology, and instead seeks to “penetrate the interior realm of animism, for we are in search of anima, or soul” (Hillman 1975, p. 3). This metaphysic is the real defense, he argues, against the psychic power, not as allegories under the rule of reason, but of vital, autonomous animated images. Against this religious and psychological literalism, he urges being in the world and experiencing it as a psychological field. The ancient Greeks did this when they personified the psychic forces in culture such as fame, insolence, timing, hope, ugliness, friendship, modesty, mercy, peace, and in the world as dawn and night. This poetic language is necessarily mythological but must be rescued from its rationalist prison and released to free the soul to experience the vitality of the inner and outer worlds. Hillman says: “Subject and object, man and Gods, I and Thou, are not apart and isolated each with a different sort of being, one living or real, the other dead or imaginary. The world and the Gods are dead or alive, according to the condition of our souls” (Hillman 1975, p. 16).

While these worlds of night and hope are within us, we also live within them. The epidemic of depression in our society, Hillman says, may well be not simply personal problems but feelings of collective grief and helplessness about the way industrial society has ravaged the world with pollution: “I know now that a great deal of the depression I suffered in Los Angeles was due to the effect of the smog. . . (1992, p. 82).” Avoiding literalism, we must also see through varieties of soul-in-the-world to the deep mysteries that they disclose, the one collective world below the ordinary particulars of life – the *anima mundi* – soul of the world. This is a de-literalized, radical, and highly refined form of the old “animism.”

Thomas Moore

Thomas Moore is another archetypal therapist in the Jungian tradition who presses forward the phenomenon of soul-in-the-world. In *Care of the*

Soul he says, “Our felt relationship to things” in a soul-ecology “wouldn’t allow us to pollute or to perpetrate ugliness. We couldn’t let a beautiful ocean bay become a sewer system for shipping and manufacturing because our hearts would protest this violation of soul” (Moore, 270). *Anima mundi*, he says, is not a “mystical philosophy requiring high forms of meditation, nor does it ask for a return to primitive animism” (Moore, 281). It involves simply a cultivating and feeling the arts of life with depth – art, music, food, and gardens. This shift is needed to care for our souls more fully, to balance the one-sided rationality that industrial society demands.

In *The Re-Enchantment of Everyday Life*, Moore goes further and explores “enchantment,” as when one walks in the woods and feels transported by the wonder and may even imaginatively feel the inward voices of the trees and waterfalls speaking. From the farm spirit to garden paradises, Moore urges industrial societies to reawaken ancient songs in the heart of nature spirituality to head off our ecological suffering with a radically new openness to the mysterious and enchanting depths of nature.

Many other thinkers are exploring these same themes from various angles. Martin Heidegger offers a powerful and influential new ontology of Being-in-the-world (*dasein*). Jane Goodall has shifted animal studies toward accepting the souls of animals rather than behaviorally treating them as machines. Graham Harvey is writing about a new animism, as *Animism: Respecting the Living World*. Thomas Berry is exploring a *Universe Story* that integrates theology and nature. The old animism was a way of clearing the world for industrialism of the very soul that the new animism is reawakening, but as it develops, the new animism will engage in a dialogue with science and religion that will change both.

Anthropocentric View

Stacey Enslow

Anthropology Department, Purdue University,
West Lafayette, IN, USA

The anthropocentric view is a human-centered ideology. Christianity, Judaism, and Islam are all religions that are considered to have a strong anthropocentric view. This owes to the origin mythologies shared among these religions that claim all of creation was created by God for the use of humans, as in the Biblical *Genesis*:

Then God said, 'Let us make man in our image, in our likeness, and let them rule over the fish of the sea and the birds of the air, over the livestock, over all the earth, and over all the creatures that move along the ground.'

God blessed them, and said to them, 'Be fruitful and multiply; fill the earth and subdue it; and have dominion over the fish of the sea and over the birds of the air and over every living thing that moves upon the earth.'

God said, 'I have given you every plant bearing seed that is upon the face of all the earth, and every tree with seed in its fruit; you shall have them for food' (Gen 1:26–29).

In the anthropocentric view, humans are the favored children of the creator. This is in contrast to other religions such as Buddhism, which doctrinally ascribe a favored status to all beings, as in *The Lotus Sutra*:

I cause the Dharma rain to rain on all equally,
never lax or neglectful.
When all the various living beings
hear my Law,
they receive it according to their power,
dwelling in their different environments. . .
The equality of the Buddha's preaching
is like a rain of a single flavor,
but depending on the nature of the living being,
the way in which it is received is not uniform,
just as the various plants and trees
each receive the moisture in a different manner
(Watson 2000, pp. 46–47).

Philosophical movements, such as the Deep Ecology movement, which are expressed through radical environmentalist and animal-rights

movements, favor a “biocentric” or even “earth-centric” view, in which the entire ecosystems are seen as the primary placeholder of importance. In such a view, humans are only important as one factor in an interconnected web of relationships.

Anthropomorphism

Lee W. Bailey

Department of Philosophy and Religion, Ithaca College, Ithaca, NY, USA

Anthropomorphism is the portrayal of the gods and spiritual powers beyond and in the world as having human appearance and qualities. It critically reverses the saying that “humans were made in the image of God” to “the gods were made in the images of humans.” Theriomorphism is the

analogous portrayal of spirits in animal form. Anthropomorphism is an ancient, widespread aspect of religion, evident in statues of gods and goddesses as if they were human, as in Egypt (Osiris), Greece (Aphrodite), or India (Krishna). They may blend human and animal images, as in animal-headed human figures. The Roman orator Cicero (106–43 BCE) complained of the “poisonous honey of the poets, who present us with gods afire with rage or mad with lust, and make us the spectators of their wars.” But he concluded that “we must admit there are gods,” due to innate ideas of the divine (Cicero 1972, pp. 87–88). A critical view of anthropomorphism may criticize the former “poisonous honey” and debate the latter “innate ideas of the divine.”

Anthropomorphism is an issue that combines both ontological and psychological elements. It appears in both natural and cultural contexts. All have thick layers of mythic expressions. (1) Ontological anthropomorphism appears in both transcendent, heavenly theologies such as Zeus and immanent nature religions such as the Pueblo Kachinas (Kachina). Many combine the two, as with Ishtar, Babylonian goddess of fertility, who lives at least part of the year in the heavens with other anthropomorphic deities and descends to the underworld of death. (2) Human psychological drives or archetypal images also provide ripe opportunities for mythic anthropomorphism, from heroes (Superman) to lovers (Helen of Troy) and enemies (Satan). (3) The tendency to personify powers of the cosmos and nature continues in the names of planets (Jupiter), hurricanes (Katrina), and animals (Hanuman, the Indian monkey-headed god (Fig. 1). (4) We find the urge plentifully in cultural artifacts – puppets (Pinocchio), dolls (Barbie), and machines (android robots – The Terminator). Theologically, the questions are whether the gods are “nothing but” finite human images, whether the ultimate cosmic reality is in any way analogous to images of our planet’s life forms, whether humans can participate in a portion of the energies of the divine, or whether we can know nothing of the divine through human images. Psychologically, are

Anthropomorphism, Fig. 1 Hindu Hanuman, illustrating anthropomorphism Calcutta, 1882 (Art from Wilkins 1882)

anthropomorphic images inevitable? Ontologically are they necessary?

Ontologically, the question is whether or not anthropomorphic images are accurate expressions of the ultimate reality that they seem to signify. Is God really fatherly? This cannot be proven, so in religion believers must acknowledge their faith or, if more forceful, press their orthodoxy and literalism, either tolerantly or intolerantly. Psychologically, the question of the role of imagination in perception and cognition is central, whether in strict literalism or poetic metaphor. The psychology of the unconscious since Freud (1974) helps to see anthropomorphism theoretically as an unconscious tendency that is an inevitable psychic dynamic with its own patterns, as in dream symbolism where a human represents a dynamic, such as sex or moral guidance. Freud, however, while showing the inevitable and meaningful nature of unconscious symbols, saw them as distortions of psychological reality and tended to interpret images narrowly to fit his theory of the sexual predominance of unconscious drives – guns as male genitals, boats as female, etc. Oedipus and Narcissus are the classic Freudian mythic anthropomorphic images. His theory of projection,

rooted in Feuerbach's 1841 critique of God, offers a strong theoretical basis for understanding anthropomorphisms as symbolic externalizations of inner dynamics, such as threatening Oedipal fathers seen in society (teachers), myths (villains), or religious authority figures (God). Can anthropomorphism be fully rejected? Should it be? These questions have been answered in a cluster of five types of arguments: the arguments that interpret anthropomorphism as disposable, necessary, analogous, personifications, or presence.

The Disposable Argument

Anthropomorphism is inevitable but unnecessary, in this argument, because it is disposable entirely in the scientific method's rigorous epistemology of eliminating subjective additions to objective reality, which excludes any religion. Scientific efforts to disenchant the world attacked the attribution of human qualities to nature in order to clear the way for a more rational analysis. Zeus no longer throws thunderbolts from the heavens when science can give a better and fear-reducing explanation. Galileo's rejection of the cosmology of an earth-centered universe was so controversial because it attacked the parochialism of the anthropological assumption that humans are the center of the cosmos. Nineteenth-century anthropologists such as Edward Tylor culminated the modern attack on anthropomorphism in animism, stripping the world further of whispers of the sacred (Tylor). Anthropomorphism is seen by most scientists as an outdated, distorting primitive regression of children, poets, and madmen, which has been replaced by scientific method that requires its distortions to be removed from the real world, truly known only by scientific method. The epistemology here assumes that imaginative language and its symbols have no valid part to play in rational, scientific knowledge and that religious language can be stripped of its primitive layer. Some call anthropomorphism a "pathetic" fallacy, referring to the "pathos" (Greek for suffering) or passion in the images supposedly clouding reality.

But anthropomorphism has not entirely left the scientific stage. Scientists debate this issue in

animal ethology, for example, where some name the elephants, chimps, or whales that they study. Jane Goodall (Goodall and Bekoff 2002) names her chimps and Katy Payne (1998) names her elephants, describing mothers, aunts, and bulls, using family analogies, blended with detached scientific analysis. They develop empathy for them and even hint at a sense of the sacredness of their existence, threatened by poachers. Those who oppose such empathy may number the animals they study to prevent empathic anthropomorphizing. But can animal behavior be understood at any depth without making analogies to our own animal feelings? Astronomers still anthropomorphize planets with names of ancient gods – Venus, Mars, and Jupiter – and physicists describe aspects of dark matter as "machos" and "wimps" (Greist). The best efforts at "objectivity" have not succeeded at eliminating all anthropomorphism from science. Unconscious remnants or conscious empathy has not been shed and perhaps cannot or should not be shed. The unconscious is difficult to eliminate in thought, and ethical considerations such as empathy for animal suffering may make some anthropomorphism ethically valid.

The ancient worldwide anthropomorphic principle of sacrifice was based on the portrait of divinities that required to be fed by sacrifices of valuables such as cattle, in order to bestow on humans their gifts, such as children, food, or military victory. The gradual ethical humanization of Western religions stopped this practice. Human sacrifice was rejected in the story of Abraham almost sacrificing his son Isaac, for example. Then Jewish animal sacrifice finally stopped in 70 CE, when the bloody sacrificial practices of the second temple, destroyed by the Romans, gave way to more humanistic local synagogue rabbinical teaching. Christians interpreted Jesus as the "last sacrifice" to God to atone for human sin.

The disposable argument still influences theologians in a different way. Rudolf Bultmann sought to demythologize the New Testament, not just to reveal the true historical events, but to strip away the anthropomorphic mythic accidents of its environment and translate it into abstract

existentialist categories for a purer theology (Bultmann). The myth of the Messiah becomes faith in the freedom to live an authentic life. Today some biblical scholars, such as the “Jesus Seminar” group, continue the nineteenth-century effort to find the historical foundation of the Bible by eliminating as many mythic symbols as possible (Jesus Seminar). They assume that the only valid language of faith is historical, not imaginative. The problem with this approach is that it is unable to rid itself of its own embedded imaginative language.

Gender is a sore point here, when feminists accuse scientists of reserving true scientific objectivity to the male psyche and charge theologians with still referring to God as “He,” thus retaining the father myth of God. Feminists are experimenting with using images of God such as mother, friend, or lover (McFague). Others see in science an anthropomorphic assumption that human rationality, through scientific method, is capable of knowing it all. This is called “Scientism” (Stenmark 2001). But despite its successes and empirical testing, it may be that science is able to know only a narrow range of existence and, by ignoring the rest, distorts its picture of the whole of reality, as expressed by our images of flawed android robots and crises such as global warming. The disposable argument depends upon conscious knowledge and neglects unconscious anthropomorphizing.

Iconoclasm, or “image smashing,” is a cultural and religious attack on images, especially of the divine. Judaism built iconoclasm into the Ten Commandments, saying “no graven images” were allowed of anything in heaven or on earth, perhaps reacting to their experience in Egypt, where anthropomorphic and theriomorphic divinities were so numerous. Similarly Islam rejects human and animal images in its art and allows only calligraphy and plant forms. Theoretically iconoclastic Roman Catholic churches are full of frescoes, paintings, and statues of Jesus, Mary, and saints. Protestants discarded numerous visual images and decorations in churches, so much that Calvinist churches were described as having only “four walls and a sermon,” stressing the “Word” rather than the visual image. All, however, use

verbal, literary images profusely in their faiths – God as warrior, liberator, king, harsh judge, merciful, and, above all, male and fatherly. Buddhism stands out among highly anthropomorphic Eastern religions for its theoretical rejection of anthropomorphism, although in practice Buddhists use many images, such as statues and painting of Buddhas such as Amita Buddha in China. Also Buddhism’s acceptance of the widespread Asian belief in reincarnation retains a sense of transmigrating spirits pervading all sentient beings. The iconoclastic view that anthropomorphism is disposable neglects the unconscious or unacknowledged role of imagery in culture.

The Necessary Argument

Anthropomorphism is inevitable and necessary, some argue, because its imaginative forms are a functional part of perception, knowledge, and religion. It provides necessary organizational frameworks that reduce chaos and fear. Imagination is a part of the way we think, and how can we avoid thinking in metaphors from our environment? For most who think this way, there is no divinity behind the images. Here anthropomorphizing is a type of imaginative projection into the world that is a necessary way of stabilizing the world. The supposed objective world cannot be fully known, only the “marked” world of meanings. They are subject to critical analysis and change, but are not all disposable. Astrological anthropomorphisms, for example, can be withdrawn as erroneous projections, but certain symbols, such as scientist-heroes, are needed to stave off chaos, fear, and despair (Sierksma).

In Holland, Fokke Sierksma (1956) thought that anthropomorphic gods, such as a lawmaking, loving fatherly God, are needed to complete the *terra incognita* beyond the world ruled by ego. They are needed subjective gap fillers in a world whose depth below the subject-object divide finally eludes us. But he believes that God is dead. These psychological and theological constructs can be modified by critical thought.

Stewart Guthrie (1993) argues that anthropomorphism pervades perception for good reasons.

We are predisposed, shows cognitive science, to see the human form and qualities everywhere, and the more organized these “faces in the clouds” are, the stronger perception is. The more we see what we expect to see, in familiar images and categories, the clearer and more certain knowledge or religion seems. But comfort is not a function for anthropomorphism because some images, such as Satan, are frightening. For Guthrie, anthropomorphism is the very core of religious experience, and any religion that seeks to eliminate the gods is not a religion. For Guthrie there is no real god – the clothes have no king. This position gives more importance to anthropomorphism, but psychologically, it seeks to keep the world ruled by cognitive ego-consciousness, theoretically in control of all its worldly imaginative projections.

The problem with this view is a lack of critical flexibility. The familiarity of the frameworks makes them seem unchangeable. In technological culture, the solution to problems is too often imagined to be just more technology in the same framework (reenforced by science fiction anthropomorphisms), not a reexamination of the assumptions of technology itself, such as the domination of nature. Much anthropomorphism is taken literally, especially in religion. Fundamentalist religions claim patriarchal privileges, because God or an incarnation of God is male, and literal views of creation and social roles because it says so in the holy text. This blocks the critical flexibility of reforming outdated anthropomorphisms. Also, mainstream religions that allow some critical adaptations need to ignore old parts of the sacred text, such as slavery and patriarchy. This selective neglect can become embarrassing, as when critics point out the pervasive violence in major religious texts, which become blessings on bloody nationalisms (Nelson-Pallmeyer).

The Analogy Argument

Theism is the major religious expression of the divine with human qualities. While most believers talk as if the anthropomorphic images of the gods were literally true (e.g., God the Father),

philosophers and theologians have wrestled with how this could be. Maimonides argued that God is absolute and without anthropomorphic qualities, but organs such as the heart are metaphorically used to describe God in similes to awaken a sense of “His” higher spiritual reality. The Neo-Platonic principle that by *participation* the divine intelligible world descends into the material world influenced many, notably the Christian Eastern Orthodox, who struggled with whether the divine is present in their icons and concluded that earthly forms can convey the “energy” of God, but not the “essence.” Very influential has been the ancient principle of *analogia*, expressed by Denis the Pseudo-Areopagite, who wrote that creatures have the capacity to receive divine ideas, but only by analogy, or in proportions, not giving complete knowledge of God. Hugh of St. Victor wrote that the world is a book written by God, and many saw in nature the signature of God. The Roman Catholic principle of *analogia entis*, or analogy of being, is the acknowledgement that human images are analogies, proportional images of the vast mystery of being itself. Thomas Aquinas wrote that human qualities such as goodness are figurative and limited in proportion to God’s goodness (O’Brien 1981; Walker 1985).

In India the *Rigveda* (Anonymous 1981, pp. x, 90) describes the creation of four social castes – brahmanic priests, warriors and government officials, shepherds and merchants, and servants – from the body of the anthropomorphic Purusha, a sacrificial personification of the world soul. Thus, the entire caste system is justified on an anthropomorphic analogy. Later Vedantic gurus mingle anthropomorphisms such as Ishvara (Brahman with qualities) and Brahman as the ground of all physical experience but stress the underlying oneness of all existence in Brahman (Radhakrishnan and Moore 1957, p. 507).

The subtle quality of the analogy principle makes it difficult for theistic traditions to avoid anthropomorphism. Even sophisticated theologians cling to literalisms such as the maleness of God and Jesus or the Brahmanic priestly tradition to justify a male-only priesthood. Again, unconscious anthropomorphism may overcome the best of intentions in this position.

The Personifications Argument

Anthropomorphism can also be seen as a robust type of imagination, which is acknowledged to be a full partner in knowledge and faith, a valid epistemology of the heart that is essential to a full life. In archetypal psychology there is an argument that when anthropomorphic (or theriomorphic) images become fascinating in society, nature, culture, or dreams, they are inevitable and necessary, but not literal, archetypal personifications of the soul with important messages. They should not be seen as completely disposable or suitable for conversion into an abstraction such as “the father archetype.” One should, especially in psychoanalysis, explore the meaning of these images, for they bring important messages from the personal and collective unconscious. In imaginative conversation with these figures, one may, for example, realize that one has outgrown their childhood image of their father, may be able to forgive him his flaws, and thus release painful self-judgments, anxiety, or depression. This helps free religions of fatherly anthropomorphisms as well.

Such working with anthropomorphic images of psychic dynamics does not take the personifications literally, or translate them into conscious theories, but imaginatively engages them as meaningful expressions of real psychological forces. There is a paradoxical involved empathy yet an ability to stand back and withdraw from the drama, think about it, and integrate it into daily life. This takes a strong yet imaginative ego able to relax and journey into the “underworld,” play with personifications without being overcome, and return to ordinary ego-consciousness.

This theory does not seek to follow overly conscious, literal scientific methods, but is used in psychotherapy, where symbolic unconscious dynamics behind conscious life are discovered and brought to the surface for conscious reflection. Archetypal theory, originating with Carl Jung, explores the depths of the collective unconscious and helps see the meanings of the unlimited range of anthropomorphic images that form an inevitable part of the soul, but do not cancel religion. Archetypes are unconscious, collective

psychological patterns on a continuum with biological instincts. How, for example, does the psyche experience terror and evil? Jungians emphasize the strong role of shadow figures, often anthropomorphic, mythic images of evil: Satan, Hitler, villains, monsters, beasts, Frankenstein, and the terrifying, repressed “other.” For Jung they show that in analysis one typically confronts the secret shadow (e.g., bad parent) and hopefully finds a treasure in it (e.g., good parent). Each archetypal pattern has its shadow. The lover Jung described as the *anima* (a man’s dream mother, lover, or shadow witch) and the *animus* (a woman’s dream father, lover, or shadow beast). Contemporary archetypal feminists let goddess images express the wide range of feminine roles (Bolen; Young-Eisendrath and Dawson 1997).

Jung emphasized the central, regulating role of the Self archetype, which he saw as an image of psychological divinity with innumerable symbols, such as the abstract mandala circles, animals (lion “kings”), nature (mountains, precious stones, and metals), and humans (avatars, incarnations, prophets priestesses, innocent children). This symbolic flexibility in expressing divinity opened many doors for theology, notably the feminist goddess explorations and ecological nature spirituality (Jung 1953–1978, Vol. 9, Pt. 2, Chap. IV “The Self,” para 43–67).

Archetypal theory offers a valuable way of seeing anthropomorphism, free of naïve or dogmatic literalism, reductive scientism, or excessively cognitive ego-centered consciousness. It allows for anthropomorphic symbolism, but at the same time, it sees it as a kind of poetic, mythical play of the soul that can be made conscious only partly but is subject to critical analysis and change. So God the “father,” for example, is a useful way to express that aspect of divinity, but it is incomplete. The great mystery of the infinite divine cannot be reduced to one-half of this planet’s human reproductive system and its mental styles. The beauty of the goddess in all her spectrum of powers and the unspeakable wonder of the universe and earth’s rainbow of preverbal forces – stars, stones, mountains, lakes, animals, plants, etc. – can also be seen as expressions of the

numinous immensity, not just those aspects that can be symbolized by an anthropomorphic father-like God (Jung 1953–1978).

The post-Jungian analyst James Hillman (1975) emphasizes the value of “personifying” or imagining. He rejects the “disposable” theory of anthropomorphism for being nominalist by denying the natural validity of imaginal experiences. Personifying respects images as they appear in gods or mythic figures. Much as an author’s fictional characters develop their own realities, personifying is an immediate receptive experience. It is a way of being in the world and feeling the world as a numinous, soul-filled psychological field. Ancient Greeks and Romans personified psychic powers such as hope, timing, night, and ugliness, not as unreal illusions, but as images of real phenomena. Athens had altars to friendship, modesty, mercy, peace, victory, and fortune. When such powers are not given their imaginative due, they may become illnesses, Jung stressed. Personified images have feeling tones and can be cherished or may reveal shadowy truths under the covers that need to emerge. Plotinus, Michelangelo, Vico, and Blake all saw the necessity to personify mythic perspectives to understand the soul’s intentions. Distinct from the dead world of industrial society, personification lets the world speak. Moonlight becomes love, dream villains demand attention and transformation, and gods offer salvation from suffering. Personifying is natural and only demythologizing is unnatural, Hillman argues. People may fear a personified world as a child fears the dark, but befriending the stories as imaginative expressions of deep forces of the collective soul is transforming, like a child’s security doll or popular adult heroes who conquer evil. Anthropomorphism may be a necessary way of charming fearful strangeness out of the world.

Gods symbolically express deep and powerful collective forces that are inevitably experienced as human in appearance and qualities, but at the same time, if not literalized, they can be taken into the imaginative psyche for what they can provide. The monotheistic God is not a literal father, but the father-ness of “his” image offers an image of life-giving, nurturing, and loving

moral guidance. Conversely, the goddess offers “her” life-giving, nurturing, and loving moral guidance with a different emotional tone, perhaps dancing rather than fighting. Many-armed gods express their many manifestations. These autonomous images are both in us and we are in them. They reduce the hard-nosed, literal influence of cognitive ego-consciousness and draw us into their enchanting world under the surface of control. We can interact with their different aspects and be transformed by them, practicing karate, dance, love or forgiveness, as they suggest. This process of soul-making requires faith in their powers, not as literal people out there or back then, but as personified soul-in-the-world. This is a difficult but stimulating challenge for industrial consciousness and theism.

The Presence Argument

The most abstract theoretical response to anthropomorphism goes beyond iconoclasm and personification to an affirmation of the mystical presence of an impersonal ultimate reality, not a thing because it is the source of all things, beyond yet within – *neti, neti*, not this, not that, say the *Upanishads*. This *theologia negativa* points to the divine darkness, the cloud of unknowing, the deep mystery beyond all human images and knowledge. Some speak of a pure consciousness, difficult to perceive and articulate, subtle and quiet, but deep enough to transcend various religions and provide a foundation for the many images and theologies. Meditation is their common practice. Eastern traditions more readily differentiate between higher and lower forms of religious practices. In Hindu Vedanta, the absolute is impersonal, and personalist theism and *bhakti* devotion are seen as a lesser practice. South Asian traditions commonly distinguish between conventional truth and absolute truth. Be still and know, say Buddhists such as Thich Nhat Hanh. The Zen monk meditates with an anthropomorphic statue of the Buddha yet seeks nothingness. Find your own face before you were born, they say, and find ways of speaking of the great mystery that are original and authentic for you.

This is a difficult challenge. This path is atheistic, in the sense of denying (but tolerating) the need for theistic personal images in the quest for ultimate spiritual reality (Thich Nhat Hanh).

This position acknowledges that for most people, images of divinity are inevitable and necessary, but for those who undertake deeper practices, the masks of the gods fall away and an ineffable, powerful experience of ultimate reality emerges that is beyond words and pictures. This “apophatic” position sees images as useful approximations but disposable earthly images that must be set aside. Images of “light” are common here or, philosophically, abstractions such as being, presence, emptiness, or Buddha Mind.

Plato sought to purge philosophy of anthropomorphic Greek gods with his abstract ontology of being, but he also told many myths, such as a creator god (Plato 1961, *Timaeus* 69b). Michel de Montaigne summed up a long debate, writing that:

The least-known things are the fittest to be deified; wherefore to make gods of ourselves, like antiquity, passes the utmost bounds of feeble-mindedness. . . . But to have made gods of our condition, the imperfection of which we should know, to have attributed to them desire, anger, vengeance, marriages, generation kinships, love and jealousy, our limbs and our bones, our fevers and our pleasures, our deaths, our burials — this must have come from a marvelous intoxication of the human intelligence (de Montaigne 1575/1958, p. 383).

Nineteenth-century religion scholars envisioned an evolution of religions from naïve animism and anthropomorphism, as with the Egyptian gods with animal heads, upward to an iconoclasm that purified religion into a more abstract theistic god that retained personal qualities. But such a preliminary evolutionary schema is not valid, given the continuing multiplicity of religious forms today. Mystics commonly stand for the “presence” position, emphasizing cosmic mystery and the importance of the presence of ultimate reality found in experience, over theorizing. Meditation, near-death experiences, and visions are common ways that this ineffable presence is experienced.

Buddhism is noted for its emphasis on simply sitting quietly in meditation, cultivating

mindfulness and clearing the mind of worldly distractions, awaiting the appearance of the unnameable. Images such as statues of the Buddha, incense, robes, and traditional monastic practices, especially meditation, are central, but the awakening cannot be forced by form. Poetic, original, and paradoxical names such as “the sound of one hand clapping” are honored as creative approximations, but not dogmatic concepts that harden cognitively and lose their energy. The bottom drops out of the ordinary ego and compassionate energy floods the humble practitioner who is grasped by a power beyond anthropomorphic representations.

One aspect of this approach is sometimes the attempt to leap over the passions, emotions, and grief of the normal ego and transcend them, rather than wrestle with them, as in psychoanalysis. Equanimity in the face of suffering, indulging in neither pleasure nor pain, is the goal, in contrast to the Western post-Freudian encounter with the unconscious soul on the way to transcendent peace. Some, such as Jung, say that, no matter how spiritual, any effort to leap over the passions is mistaken.

Anthropomorphism is a natural and strong human way of trying to make sense of the world. Some embrace it, consciously or unconsciously. But it can interfere with the search for truth and needs critical detachment to prevent its limiting control of thought or belief. Critics who seek to eliminate anthropomorphism entirely should acknowledge the difficulty of knowing nature and ultimate reality behind the images of unconscious mythic dramas. Psychological personification and meditative wisdom point beyond literalism and abstract rationalism to poetic and pre-linguistic experiences that may ring with echoes of a far but near power.

Antichrist

Bobbi Dykema Katsanis

Graduate Theological Union, Berkeley, CA, USA

Introduction

Antichrist, at the most basic level of understanding, is simply any opponent of Christ or, more commonly, *the* ultimate final opponent of Christ. This figure embodies all that is antithetical to Christ, Christ's teachings, and Christ's salvific action in the world as Christians understand these concepts. While based in a few rather obscure passages of Christian scripture, the concept of Antichrist and accompanying narratives and descriptions about Antichrist's identifying characteristics, deeds, and context have developed in a long and rich tradition from the earliest days of Christianity.

Antichrist is mentioned as such only once each in two of the three epistles of John in the Christian New Testament. However, Christian theologians from very early on began associating Antichrist with the Beast described in the scenes of final judgment in the Apocalypse of John (also known as the Book of Revelation), as well as with apocalyptic imagery in the Hebrew Scriptures book of the prophet Daniel, and with brief apocalyptic moments in each of the four canonical Christian gospels. The main thrust of the Antichrist story is that in the final years of life as human beings know it on Earth, Antichrist through his charismatic powers of deception will come to hold sway over the affairs of humankind for a period of 7 years. At the end of this period, Antichrist will ultimately be defeated by Christ and condemned to eternal torment in the lake of fire, after which all people, living or dead, will be subject to final judgment and either eternal reward or punishment for their earthly deeds and faith (or lack thereof). Adele Yarbro Collins relates Antichrist imagery to a primeval “combat myth” of cosmic struggle between good and evil at both the beginning and end of the world.

The earliest influential expansion of the Antichrist legend beyond scriptural accounts was originally entitled *A Little Book on Antichrist*. This tenth-century work by the French Cluniac abbot Adso describes the figure’s identifying characteristics and context in detail. Many later writers continued to embroider upon the legend, bringing the Antichrist narrative to a level of detail on par with that of the vitae of many important Christian saints. Joachim of Fiore (1135–1202) developed a three-phase system of the final days in which Antichrist would reign over the last few years of human life on earth, and Dante’s *Inferno* associates Antichrist with those who have committed the sin of simony, i.e., selling ecclesial office for profit. The Antichrist narrative gained peak traction during the Protestant Reformation, when reformers such as Wyclif, Hus, and especially Luther hurled the polemical language of Antichrist at their religious opponents, primarily the papacy.

Further developments of the Antichrist legend in the modern period have been more subdued; yet

the legend still carries weight, particularly with American Christian fundamentalists. The Zionist movement in the state of Israel has been associated with aspects of the apocalyptic narrative of Antichrist in the writings of Hal Lindsey (*The Late Great Planet Earth*) and of Jerry Jenkins and Tim LaHaye (the *Left Behind* series of novels, films, and television shows). Important modern literary and filmic treatments of the figure of Antichrist include Dostoevsky’s Grand Inquisitor in *The Brothers Karamazov* and Roman Polanski’s adaptation of the Ira Levin novel *Rosemary’s Baby*. The figures of Sauron and Saruman in Peter Jackson’s adaptations of J. R. R. Tolkien’s *Lord of the Rings* trilogy also function as important.

Antichrist figures in the popular imagination, as do horror-genre versions such as Stephen King’s *The Stand*.

Description

Antichrist is characterized primarily as a deceptive figure whose main danger is his charismatic ability to lead some, but not all, faithful Christians astray. The reign of Antichrist over human affairs in the coming period of “end-times” will be marked by persecution, oppression and tyranny, and by various “signs of the times,” including war, earthquake, famine, and disease. Antichrist has been specifically identified by contemporaries with various tyrannous figures in history, including Antiochus IV, Nero, Henry II of England, the Holy Roman Emperor Frederick II, Pope John XXII, Napoleon Bonaparte, Benito Mussolini, and Saddam Hussein, and collective figures such as “the Jews.” Interestingly, Adolf Hitler appears less often in contemporaneous Antichrist rhetoric than does Mussolini; the careful interpreter of biblical and developing Christian Antichrist mythopoetics in any age would not have failed to note that Antichrist is traditionally associated with Rome, Babylon, and Jerusalem and not with the barbarian lands to the north. In other strands of the tradition, Antichrist is geographically associated in more general terms with Empire, in which case the Third Reich is a classic example of

intuitive free association with this aspect of the legend.

Other figures associated with the Antichrist legend and mythos include a messianic Last World Emperor whose rise to power is a harbinger of the arrival of Antichrist; the Beast or seven-headed dragon, who is often equated with Antichrist, in whole or in part; the figure of the False Prophet, who serves as Antichrist's public relations associate; and Gog and Magog, who are variously identified as specific figures or, alternately, as regions from which Antichrist may come; during the Cold War era, American Antichrist discourse often identified Gog and Magog with the nation of Russia.

The figure of Antichrist exists in a matrix of tensions. Various readings and interpretations of the figure have emphasized either a more symbolic or a more literal understanding, an understanding of Antichrist as either an interior tendency within the human psyche or an external enemy, a collective or an individual understanding, and so forth. An important distinction must be made between Antichrist and Satan. Antichrist is a powerful and charismatic *human* opponent of God. Satan, while also powerful and charismatic, is characterized in Jewish, Christian, and Muslim scriptures as a celestial opponent of God, specifically a fallen angel. Conversely, Antichrist will ultimately be defeated by Christ, but the actual death blow might be dealt by Christ's agent the archangel Michael, allowing the figure of Christ himself to never be associated directly with the irredeemable downfall of any human person.

Psychological Significance

Religious historian Bernard McGinn has characterized Antichrist as a "projection of irrational fears about enemies." The historical use of the Antichrist legend to demonize enemies, delineate boundaries of identity, and understand rapid and frightening cultural change is thoroughly documented in theological and, to a lesser extent, psychological and historical literature. The figure of Antichrist has often been used as a rhetorical device to mobilize the faithful in defense of

orthodoxy or toward renewal of community life. Antichrist language often appears in the context of communal conflict or anxiety about powerful charismatic leaders both religious and political, such as the pope (Great Reform and Reformation periods) or the emperor in various moments of consolidation of civic power in the Western and Christian world.

The call to watchfulness and mobilization on the part of believing Christians occasioned by the proximity of Antichrist may provide meaning and stability in times of crisis, uncertainty, and fear. Certain aspects of contemporary secular rhetoric also partake of some aspects of apocalyptic and/or Antichrist imagery, such as current fears regarding global warming and all-out nuclear warfare; while the groups and individuals engaged in public and private discourse on these concerns do not necessarily identify specific contemporary figures as Antichrist, the emotional appeal to a dualistic system, in which one group is destined for salvation and the other associated with the ultimate enemy, is at least occasionally a feature of such discourse. An internalized Antichrist, by contrast, does the psychological work of explicating the human impulse toward evil thoughts and actions and the existence of evil in the world. For at least some Christian believers, the figure of Antichrist is important in the context of divine intervention in human history and only makes sense when coupled with a linear and progressive (or anti-progressive) understanding of history. The figure of Antichrist is used as a way of defining deviance and policing the boundaries of acceptable behavior, as well as imbuing quotidian human affairs with cosmic significance. Manifestations of Antichrist rhetoric may be identified by such common markers as polemical language; prophetic utterances describing the future; popular anxiety, stress, or strife, often denoted by persecution complexes or actual persecution; purposeful targeting of suspect groups by those who believe themselves persecuted, which can include parties from either or both sides of a specific conflict; and parodies of the main tenets of the vitae of the figure of Jesus Christ.

Jung characterized Antichrist as a personification or manifestation of the essential shadow side

of, rather than simply a privation of, that which is good. Thus, ignoring or refusing to confront the existence of evil personified by Antichrist as a component of that which is good can be just as psychologically damaging as ignoring the good itself. For Jung, the figure of Christ is “parallel to the psychic manifestation of the self”; therefore, Antichrist is the self’s shadow-side manifestation. This paradox is necessary because for Jung, light and shadow must be in balance in human self-understanding to ensure the psychological health of the whole person.

While Freudian psychology does not necessarily deal specifically with an Antichrist figure, elements of the conflict between Eros and Thanatos tend to be present wherever Antichrist themes are drawn into public and religious discourse. Robert Fuller has characterized Antichrist language as an outward manifestation of human fears of strong emotions, pleasures, and lusts. Emotions are channeled through religious symbolism and in symbolic terms, helping the individual and community to deal with otherwise unacceptable feelings and behaviors. Antichrist embodies that which is taboo, becoming a demonization of hidden or unconscious desires and externalizing the struggle against seductive ideas and disloyal thoughts. Additionally, the scatological and erotic components of Antichrist rhetoric point toward a possible developmental-psychology understanding of the figure of Antichrist.

Bruno Bettelheim has suggested that the dark, erotic, and/or violent aspects of children’s fairy tales serve a vital developmental purpose in slowly acclimating juvenile minds to the real terrors of the world outside the nursery. Given the titles and styles of certain important historical Antichrist, such as Adso’s *Little Book on Antichrist* or the 1521 Reformation pamphlet *Passional Christi und Antichristi*, it is possible that Antichrist legend has historically been a component of the religious and psychological developmental education of children.

The often conservative and even reactionary uses of Antichrist rhetoric seem to imply that Antichrist language might be useful to communities that find themselves in cultural opposition to intellectual trends, whose truth claims are subject

to cognitive dissonance with modern scientific and technological understandings of the physical world. That Antichrist will ultimately be defeated reassures the Christian believer that God is in control of human affairs and that in the end evil will not prevail.

Jewish

While a discrete figure identified as the ultimate human opponent of God has not been an important part of Jewish tradition, the Jewish figure of *Armilus* also draws upon the apocalyptic imagery in the book of the prophet Daniel. However, no such figure appears in Jewish writings before the *Second Temple period*, and Armilus is not attested to by name before the seventh century, appearing in the *Targum* to Isaiah. There he is described as the *offspring* of a coupling between Satan and a beautiful stone statue of a female human being. In the Midrash, the eschatological role of Armilus is to slay *Messiah ben Joseph*, after which he himself will be slain by *Messiah ben David*.

Islamic

Similarly, the Islamic figure of the *Dajjāl*, while functioning in similar ways to the figure of Antichrist in Christianity, perhaps carries rather less weight in Islamic traditions than the Antichrist figure does in the Christian imagination. The *Dajjāl* does not appear in the Qur’an, but develops in the *hadith* or sayings concerning the prophet Mohammed. The *Dajjāl* figure is a false last prophet, a bizarre human monster who attempts to lead the Jews in conquest of Islamic lands but is ultimately defeated, usually by Jesus.

Anti-Semitism

Daniel Burston

Department of Psychology, Duquesne University,
Pittsburgh, PA, USA

Christian and Nazi Anti-Semitism

Anti-Semitism (or, as some say, Judophobia) is an amorphous but remarkably persistent form of religious and racial prejudice. While some scholars trace it to pagan sources (Manetho, Tacitus, Ovid, etc.), most stress its Christian origins. Generally speaking, Christian anti-Semites believe that Jews, unlike Christians, are a distinct “race,” with specific “racial characteristics,” such as darker skin and hair; a large, hooked nose; and a grasping, materialistic, and decidedly tribal outlook on life that is the opposite of the noble Christian ideal, which aspires to spiritual universality. It is because Jews allegedly possess these odious (physical and spiritual) characteristics that they reject Jesus as the Messiah and are responsible for his Crucifixion. Nevertheless, some anti-

Semites say Jews can redeem themselves and overcome their hereditary guilt by renouncing their ancestral faith and embracing Jesus as their savior. If they do, they are saved and worthy of (grudging) inclusion in the Christian community. According to the Nazis, however, faith (or the lack of it) is utterly irrelevant. The Jews’ hereditary or “racial” characteristics loom so large in the Nazi imagination that someone’s theological frame of reference simply does not matter. Thus in Nazi Germany, you could be an ardent Catholic or Protestant. But if you had one Jewish grandparent, you were labeled Jewish and were to be transported to Auschwitz in due course.

Though the Nazis thought of Jews as “Semites,” the truth is that Jews are not a “race” any longer. Indeed, when the term “anti-Semitism” was first coined in by Wilhelm Marr in 1879, it was already an anachronism. Long ago, Jews were in fact a Semitic people, as our common language, Hebrew, attests. But the phrase that occurs so frequently in our liturgy, *Am Israel* – “the people of Israel” – no longer refers to a discrete ethnic or racial group. It now refers to a community of believers that is as racially diverse as Christendom or the Muslim *ummah*.

One reason that Christian anti-Semitism is so baffling is that Jews and Christians have so much in common. One conviction we share, rooted in Genesis, chapter 1 (verse 21), is that each and every human being is made in the image and likeness of God (Genesis 1:26). The practical upshot of this belief is our shared emphasis on the oneness or unity of the human species, on the one hand, and on the worth and singularity of each and every human being, on the other. In addition, Judaism and Christianity converge impressively in their emphasis on the virtues of justice and mercy, and their desire to foster a truth-loving disposition among the faithful.

Another core conviction we share is the virtue of *courage*, which both Christians and Jews associate closely with another trait, namely, *faith*. Jews and Christians claim that their faith gives them the courage needed to live a life based on justice, mercy, and a truth-loving disposition or to continually aspire to live in harmony with these values when we fail, as we all do, from time to time. In addition to courage, we place considerable

emphasis on two other virtues, fidelity and humility. A synonym for fidelity is faithfulness, which carries the implication that those who are unwavering in their loyalty to their God are also full of faith. So, for Jews and Christians alike, courage, fidelity, and humility are virtues which pivot around the central experience of faith.

Why do Judaism and Christianity share these core convictions? Because they were rooted in the religious environment that Jesus grew up in. Nevertheless, many Christians still subscribe to the mistaken idea that Jesus first taught or inspired this kind of faith, while the Jews were lacking in these attitudes and sensibilities, being robotically enslaved to “the law.” This persistent fallacy is subtly anti-Semitic and when coupled with the claim that the Jews are collectively responsible for the death of Jesus, constitutes the core of Christian anti-Semitism. That being so, it is important to stress that the habits of the heart that pious Jews and Christians share today were simply Jewish in the first instance. The gospels are strangely silent on Jesus’ religious education, but he must have absorbed these ideas with the very air he breathed and probably from some of the same Pharisaic rabbis the New Testament roundly condemns for their lack of realism, generosity, and spiritual authenticity. That is what most scholars believe, anyway (e.g., Crossan 1996).

The belief that the Jews are collectively responsible for the death of Jesus may have been brewing for a century or so before it was finally published in 167 CE by Bishop Melito of Sardis. This claim was not formally repudiated by the Catholic Church until the Council of Trent (1545–1563). As subsequent history attests, however, this important declaration of principles had little impact. In response to Kristallnacht – in which the Nazis terrorized the entire Jewish population, killed almost 1000 Jews and transported another 30,000 to concentration camps, in Germany and Austria on November 10, 1938 – Pope Pius XI began composing an encyclical condemning anti-Semitism, but this was canceled by his successor, Pius XII, presumably to protect the Catholics living under Hitler’s power from

retaliatory measures he might have taken. As a result, it was not till after World War II, at the second Vatican Council (1962–1965) that the Catholic Church reiterated its stand on this matter and started serious efforts to combat anti-Semitism in its own ranks.

Meanwhile, according to many historians, Kristallnacht, which foreshadowed the horrors of the Holocaust, was timed – at least in part – to coincide with Martin Luther’s birthday on November 10. Despite the refreshing philo-Semitism he espoused in 1523, when he published “*That Jesus Christ Was Born a Jew*,” Martin Luther (1483–1546) was bitterly disappointed by German Jews’ persistent refusal to join his Church and became bitterly anti-Semitic. Indeed, he explicitly called for violence against Jews in tracts like “*On Jews and Their Lies*” (1543) and many public speeches toward the end of his life (Horkheimer and Adorno 1941; Burston 2007).

Anti-Semitism and Islam

A similar trajectory can be traced in the career of Muhammad (570–632). Though the founder of a new religion, rather than a Christian reformer, Muhammad initially bade his followers to pray in the direction of Jerusalem, in honor of Abraham, and started preaching in Arabia full of proselytizing zeal and good will toward Jews, which turned sour as he grew older, issuing in frequent bursts of anger and occasional campaigns of violence (Medina in 625, Khaybar in 628). Consequently, there are passages in the Koran which revile Jews and some which can plausibly be interpreted as providing religious sanction for jihad against them, simply for being Jews. That said, in 638, after the death of Muhammad, Muslim rulers invited Jews back to Jerusalem – against the wishes of the Christian Patriarch. With a few notable exceptions, Muslim rulers were more tolerant of Jews than Christian rulers were until the 1880s, when pogroms in Russia and elsewhere in Eastern Europe prompted the first wave of Zionist settlers to settle in Palestine. Ever since then, Muslim anti-Semitism has intensified and become

intricately intertwined with anti-Zionist sentiments and beliefs and a widespread tendency to Holocaust denial. Nowadays, when Christian anti-Semitism has abated somewhat in the West, radical Islamists continue to communicate and cooperate with left and right wing extremists to keep the whole sordid thing going.

Anti-Semitism and Psychoanalysis

Anti-Semitism had a profound impact on the history of psychoanalysis. The young Sigmund Freud had his heart set on becoming a research neurologist, but was deterred from that goal in 1885 by the quotas set on the number Jewish University Professors permitted to teach by ordinances passed by Vienna's notoriously anti-Semitic city council member, Karl Lueger, who became mayor of Vienna from 1897 to 1910. Lueger was an ardent Catholic whose ideas and activities contributed mightily to Freud's anti-Catholic animus. Had it not been for Lueger's civic ordinances, Freud might never have traveled to Paris to study with Charcot, and psychoanalysis might never have been created (Frosh 2005).

Somewhat later, in 1907, Freud "anointed" C. G. Jung, the son of a Swiss minister, as his heir apparent, provoking anger and consternation among his (mostly Jewish) followers, because he thought that Jung's growing stature in the world of medical psychiatry would deflect anti-Semitic criticism of psychoanalysis as a "Jewish science." These hopes were short lived. The relationship between Freud and Jung dissolved in mutual anger and disappointment in 1913, and after World War I, Jung started to characterize Freudian psychoanalysis as a "Jewish psychology" in racist journals (Adams and Sherry 1991; Samuels 1991). After World War II, Jung angrily rejected the charge that he was anti-Semitic, though it was not merely Freudians who thought so. Erich Neumann, one of Jung's closest followers, and a Zionist as well, broke with Jung in the early 1930s because of his involvements with National Socialism. In *Eclipse of God*, Martin Buber accused Jung of neo-pagan tendencies that are predicated

on a hostility to monotheism and to Judaism in particular (Buber 1952). In retrospect, like many highly educated Protestants of his era, Jung harbored both philo-Semitic and anti-Semitic tendencies. However, his struggle with Freud, and Freud's rigidity on matters of theory and practice, probably tipped the balance of his sympathies in a predominantly anti-Semitic direction for many years (Hogenson 1983; Burston 1999).

Quite apart from its impact of the lives of notable theorists in the field, anti-Semitism has been an object of study for several generations of psychoanalytic theorists. In 1938, Freud published *Moses and Monotheism*, which purported to explain anti-Semitism as a result of sibling rivalry and Freud's phylogenetic fantasy of the primal parricide. However, as ingenious as it was, Freud's book was highly speculative and simply could not account for the devastating ferocity of the Nazi onslaught. Many questions remained, and in 1946, Ernst Simmel edited an anthology entitled *Anti-Semitism: A Social Disease*. More recently, in 1988, W. Bergmann published *Error Without Trial: Anti-Semitism in Psychoanalysis*. Meanwhile, just before World War II, the Frankfurt Institute for Social Research launched a psychoanalytically informed of European anti-Semitism which was full of probing philosophical reflection, but utterly oblivious to the religious/theological underpinnings of anti-Semitism in the premodern world. This project culminated in the creation of the "A" (or anti-Semitism) scale in Adorno's monumental study, *The Authoritarian Personality* (Adorno et al. 1950). According to Adorno et al., anti-Semitism is highly correlated with religiosity and pro-fascist tendencies among American in the Cold War era. Left wing anti-Semitism, which dates back to Marx's infamous essay "On the Jewish Question" (1845) – and which has grown enormously since 1967, in conjunction with Islamic fundamentalism – was not even mentioned in this context.

Anti-Semitism is a baffling, protean, and extremely resilient phenomenon – one that is not likely to disappear any time soon. While no single theory to date can account for all its diverse manifestations, everyone interested in psychology and

religion ought to ponder its meaning and origins for themselves.

Anxiety

Allan Hugh Cole Jr.

Pastoral Care, Austin Presbyterian Theological Seminary, Austin, TX, USA

Anxiety is a common condition that presents in multiple forms and affects emotional, cognitive, physical, behavioral, and relational states. It includes feelings of uneasiness, worry, fear, apprehension, nervousness, and distress and also longing, aching, and yearning. Anxiety may also involve difficulty concentrating, ordering thoughts, speaking, and erratic conduct. A natural reaction that prepares one for responding to perceived dangers, anxiety can serve a protective function. Chronic or severe anxiety causes emotional distress, obsessive thinking, compulsive behaviors, relational struggles, and generalized restlessness. Anxiety often coexists with depression, and these exacerbate one another. Similar to depression, sources of anxiety, its effects, and its relief may be psychological, physiological, or religious in nature.

Studies indicate that approximately 13% of adults between the ages of 18 and 54 suffer from an anxiety disorder (NIMH 2004). Other studies indicate that between 25% and 33% of the population will experience significant anxiety-related problems (Terra Nova Television 2002). A survey of primary care physicians conducted in the late 1990s found that 33% of office visits were prompted by some type of anxiety (Hallowell 2001). Studies have shown further that anxiety disorders affect women (30%) at higher rates than men (19%) (Crowe 2004), although this disparity likely reflects underreporting by men. Anxiety disorders, like depression, affect adults over the age of 65 at higher rates than younger populations (NIH 2003; NIMH 2004). Anxiety among older adults is often associated with decline in health, functioning, independence, and economic stability; role loss; and increasing numbers of interpersonal losses.

There are 12 types of anxiety disorders (American Psychiatric Association 2000). The

most common include generalized anxiety disorder, panic disorder, obsessive-compulsive disorder, specific phobia, and social phobia. Agoraphobia, which involves anxiety about places or situations from which fleeing is perceived as difficult or embarrassing, is not a anxiety disorder per se, but rather is associated with other stated anxiety disorders.

Anxiety differs from fear. Fear is tied to an identifiable source of perceived danger, such as a specific person, object, or situation. Anxiety lacks a specific source. It involves a pervasive, yet objectless or vague, threat to one's well-being (May 1996). Most people find it easier to manage fear than anxiety. Because the source of fear can be identified, one may avoid, compensate for, or exert some control over it, whereas because the source of anxiety remains somewhat uncertain, one lacks a sense of control. Anxiety also differs from worry. Although anxious persons often worry, this is only one effect of anxiety.

Psychoanalytic Theory

This theory began with Sigmund Freud (1856–1939). He placed anxiety at the center of human motivation, experience, and psychological difficulty. His most mature theory held that anxiety arises when one feels helpless in the face of a perceived threat (Freud 1959/1989). This happens first in infancy, with the threat of losing the primary caregiver and what that person provides, including food, warmth, and comfort. As a child matures, anxiety involves threats of losing the caregiver's love and affection. Eventually, the basis of anxiety broadens to include threats of bodily injury and of losing the love or appreciation of other significant people. Childhood anxiety becomes a basis for anxiety throughout life. Present threats, as well as awareness of future ones, cause one to reexperience the helplessness known in past dangers. Anxiety signals the need to marshal adequate resources to fend off the new (or future) threat.

Freud distinguished between three kinds of anxiety (real, neurotic, and moral or social) but

also points to the close relationship between anxiety and fear. *Real anxiety* is essentially fear. It is based on an identifiable threat posed by an external object or situation. *Neurotic anxiety* has to do with something unknown and that needs discovering. Freud thought that psychoanalysis demonstrates neurotic anxiety's basis in threats posed by internal drives, such as the desire for a sexual affair or seeking inappropriate control in a relationship. *Moral or social anxiety* relates to one's conscience and social expectations. This anxiety remains largely concealed from awareness by adhering to moral and social customs and expectations and also by avoiding (repressing) unacceptable urges, thoughts, or behaviors. One may experience anxiety tied to all of these simultaneously.

Alleviating anxiety through psychoanalysis involves creating a safe environment that fosters identifying causes of anxiety without concern for disapproval or judgment. Deepening awareness of anxiety's sources and expressions, and reworking one's relationship to them, helps to control anxiety's effects.

Interpersonal Theory

This was developed by the psychiatrist Harry Stack Sullivan (1892–1949) in the mid-twentieth century. He expands Freud's principal focus on the individual's internal world (instinctual impulses, wishes, and fantasies) to include interpersonal engagement and its role in personality formation, and psychological health and problems.

Several assumptions guide Sullivan's theory. First, personality formation occurs *as* one engages interpersonally. Beginning in infancy, personality forms and emotional life operates according to interactions (communication) with significant others. How primary caregivers respond to the infant's basic needs is paramount. Mental stress follows from inadequate communication, not only in early years but throughout life. Second, anxiety is what impedes communication. As anxiety increases, communication breaks down. Third, individuals in relationship contribute to a shared

interpersonal field, so that interactions between two or more persons affect each individual.

Anxiety arises *not* from within us per se but as a condition of our interpersonal field. It begins when a child senses an emotional disturbance in her caregiver that alters responsive interactions and prevents meeting the child's basic needs. The child "catches" the caregiver's emotional disturbance, which is interpreted as a form of anxiety, and internalizes it. The child becomes anxious. Trying to be responsive, the "disturbed" caregiver brings the anxiety "closer" to the child and increases anxiety for both of them. The child acts to alleviate this shared anxiety by seeking the caregiver's approval. Striving for approval leads to becoming what parents and others want as opposed to whom one wants to be. Although seeking approval leads temporarily to feeling more secure (non-anxious), this eventually exacerbates anxiety. Anxiety in childhood has lasting effects, for the same dynamic process reoccurs throughout life.

Like Freud, Sullivan placed importance on helping anxious persons explore sources of anxiety in therapy and especially on increasing understanding of how anxiety relates to interpersonal relationships and conduct aimed at meeting others' needs and expectations. Relieving anxiety involves learning new ways of responding that focus on meeting more of one's own needs and expectations.

Sullivan also advocates for therapists nurturing anxious people interpersonally, with the goal of increasing their sense of security. Greater security fosters increased self-esteem and helps rework anxiety-laden interpersonal patterns in a non-threatening environment.

Cognitive Theory

This theory locates the source of anxiety in one's thoughts and thinking processes. It was proposed by the psychiatrist Aaron T. Beck (b. 1921) in the late 1960s. He observed that depression and anxiety arise from certain patterns of thinking. These patterns consist of negative assumptions and beliefs. With depression, beliefs have to do with

one's value, talents, and successes. With anxiety, beliefs involve the inability to remain secure amid potential threats. Beliefs informed by operative cognitive patterns come automatically and only subsequently provoke emotions or affective states associated with them. How one thinks about experiences, including how information is processed, determines how one feels. Beck suggested that anxiety, like depression, can be alleviated by becoming aware of operative cognitive patterns and learning to replace them. "Cognitive therapy" involves identifying and internalizing less depressive and anxiety-laden cognitive patterns.

Beck recognizes the close relationship between anxiety and fear, but he understands the relationship differently than Freud and Sullivan. Beck calls anxiety a "fear episode" that involves an appraisal of a dangerous situation. Appraisal begins as a threat enters awareness and one immediately evaluates its potential for harm and considers resources to fend it off. This process suggests that fear involves a cognitive process. One must *think* about the danger. If assessment determines a lack of protective resources, fear gives rise to anxiety, which is the *emotional* process (feeling state) that follows from being afraid (the thought process). Thinking about a threat (fear) precedes feeling anxious about it. The cognitive component of fear gives rise to its affective one, namely, anxiety.

Since anxiety is a response to fear of perceived danger, as opposed to the cause of it, therapeutic efforts should not focus on anxiety itself. The focus should be identifying, understanding, and diminishing the fear that prompts the anxiety response by changing operative cognitive patterns. This involves working on how one appraises the fear that eventuates in anxiety.

Gary Emery (b. 1942) develops Beck's principles of cognitive therapy and applies them to anxiety disorders. Emery's view of "cognitive restructuring" involves education around five matters: (1) enhancing self-awareness; (2) modifying negative imagery; (3) modifying the affective component tied to anxiety (how it feels) to lessen its severity; (4) modifying the behavioral component tied to anxiety, especially avoidance; and (5) restructuring assumptions about three major

life issues: acceptance, competence, and control (Beck and Emery 1985).

Religious Perspectives

Søren Kierkegaard (1813–1855). The Danish philosopher and theologian called anxiety “spirit sickness.” It follows from awareness of freedom, which is given by God, and the discovery that this may be used in limitless ways.

The biblical account of “the fall” (Genesis 2–3) demonstrates that Adam was the first to experience freedom and its possibilities. Adam acted against what God had commanded, and in doing so, Adam discovered his freedom. This discovery prompted anxiety over the ability to choose. Adam could choose what he desired but was forbidden, or he could choose otherwise. Either way, he exercised freedom. Adam’s choice, moreover, actualized the opportunity for sin, which existed in the state of anxiety (Coe 1985). Therefore, original sin followed from weakness as opposed to defiance (Marino 1998). One cannot defy what one does not know, and Adam did not know between good and evil before he was presented with a free choice and made it. But Adam does not relinquish responsibility for the choice that led to sin. He could have made a different choice in his state of anxiety.

Adam discovered further that one’s own freedom and choice correspond with those of others’, including God. Kierkegaard suggests that our greatest anxiety involves awareness that God is free *not* to choose us.

Anxiety has a paradoxical quality. It involves desiring what one fears (Kierkegaard 1837), and thus it involves much ambivalence (Coe 1985). This quality of anxiety recalls the Apostle Paul’s description of his own struggles, “I do not understand my own actions. For I do not do what I want, but I do the very thing I hate” (Romans 7:15).

Kierkegaard suggested that anxiety plays an invaluable role for human beings. Though painful, it quickens one to faith. Anxiety remains necessary for the Christian life. It reminds one of a need for Christ, and it helps one make choices appropriate for a life faithful to Christ (Gouwens 1996).

In this view, anxiety cannot be treated in the clinical sense, but it can be understood as a gift that promotes faith and reliance upon God. This understanding assuages the destructive effects of anxiety that follow from a fear of being rejected by God.

Paul Tillich (1886–1965). A philosopher of religion, Tillich called anxiety an ontological condition, specifically “self-awareness of the finite self as finite” (Tillich 1951, p. 192). Going beyond Kierkegaard’s view, Tillich differentiated between *existential anxiety*, a basic, universal type tied to being, and *neurotic or abnormal anxiety*, which issues from basic anxiety and has specific features. Existential anxiety, which all people experience, has its source in the awareness of the possibility of nonexistence or “threat of nonbeing.”

Set in human beings’ limited and dependent natures, existential anxiety tends to transform itself into fear. It seeks an identifiable and concrete object of which to be fearful, as opposed to remaining in a state of uncertainty. Unlike anxiety, there is a resource for fear, namely, self-affirmation and corresponding courage. Courage defends against despair by “taking anxiety into itself,” such that anxious persons must cultivate “the courage to be” (Tillich 1952). This courage for self-affirmation in the midst of threats to the self comes principally from God, whom Tillich refers to as the Ground of Being. Abnormal anxiety follows from severe existential anxiety that has not been diminished by courage and, instead, has turned into despair.

Existential anxiety receives Tillich’s primary attention. Universal in scope, it has three principal expressions. These include anxiety of death and finitude, anxiety of meaninglessness, and anxiety of guilt and condemnation (anxiety of sin). These interact and sometimes merge. Existential anxiety is overcome in authentic relationships with God and other people, which foster the courage to be.

Physiological Considerations

Anxiety often has physiological sources and effects. Like depression, physiological factors

can help produce anxiety or derive from it. Physiological factors in anxiety relate to neurobiology, including how genes, hormones, neurotransmitters, other brain chemicals, and brain structures and functions interact with various body systems. Persons with anxiety disorders tend to have highly sensitive anxiety triggers. Minimal potential threats to their well-being prompt significant changes in neurochemical and hormone levels, and they cannot prevent an acute anxiety response from fully activating. Along with different types of psychotherapy, especially cognitive and cognitive-behavioral approaches, treating anxiety often involves medications that help maintain appropriate levels of two principal neurotransmitters, norepinephrine and serotonin.

Apocalypse

Charles B. Strozier

John Jay College and the Graduate Center,
The City University of New York, Brooklyn,
NY, USA

“Apocalypse” is a transliteration of the Greek word *apokalypsis* meaning “to uncover or disclose.” Within the Judeo-Christian tradition, it means the specific ways in which God reveals himself or herself to humans. Prophecy, in turn, is the form of our access to that apocalypse, though some scholars have distinguished the prophetic from the apocalyptic traditions. In prophetism, it is argued we are called to a change of heart, to repentance in the present, to a new way of living. It is a call to efficacy and a challenge to change so that we can avoid catastrophe. In the apocalyptic, or the already determined future,

hope is deferred, which is why it is so often associated with the poor, the brokenhearted, and the oppressed (Buber 1954/1957, pp. 192–207).

In that revelation that defines the apocalyptic, human history ends as God becomes fully immanent. In most (but not all) such myths, great violence is associated with this transition from the human to the divine. World-ending notions – the hallmark of apocalypse – are thus at the same time grim and profoundly hopeful. Endings are by definition beginnings. Out of violence comes redemption, renewal, and hope.

In the Christian story, Jesus returns after apocalypse. This is a central message in His teachings, as, for example, in the Gospel of Matthew, when He describes (24:6–30) the “wars and rumors of war,” how “nation shall rise against nation” and “there shall be famines, and pestilences, and earthquakes,” how “they shall deliver you up to be afflicted” and “there shall be great tribulation,” even “the sun be darkened, and the moon shall not give its light, and the stars shall fall from heaven, and the powers of the heavens shall be shaken,” but for the faithful who survive, there “shall appear the sign of the Son of man in heaven” in great power and glory. Fundamentalists rely on a specific version of this general story, one that is more closely based on a close interpretation of the *Book of Revelation*, the last and dramatic book in the Bible. In it a sequence of events leads from the Rapture, through Tribulation, to the story of His millennial rule following the great battle of Armageddon, past a second great battle of good and evil and into the glorious making of the new heaven and the death of death itself when Satan and sinners are cast onto the lake of fire.

The apocalyptic energizes all forms of contemporary fundamentalism, including most noisily the Christian but also importantly the Jewish and Moslem traditions. These themes include the ambivalent struggle of all fundamentalisms with modernity (which is a very different thing from a rejection of the modern project), a tendency to create social and cultural enclaves that are in a sense open on one side, an exceedingly patriarchal attitude toward women, an attitude toward texts that always moves toward literalism, often but not

always an evangelical outreach, and a sense of apocalyptic doom that involves a new relationship toward violence. The general principle is that fundamentalists radically alter the faith traditions out of which they emerge but in their extremities themselves share more in common than they would ever like to admit. There is even a fundamentalist mind-set, which embraces rigid dualistic thinking, is totalistic or absolutist, moves all too easily toward a paranoid style, lives within a frame that lends it a special relationship to the divine, embraces either an actual or a potential for violence and the dispensing of the evil other, and is always apocalyptic. The fundamentalist always and absolutely yearns for the radical end of this world that will be transformed in a fire-storm into some image of final redemption, peace, and eternity.

Apocalyptic ideas, however, are rampant in American culture and by no means restricted to religious fundamentalism. Everywhere there are images of Armageddon and the end, from Homer Simpson who works fitfully for the local nuclear plant to Schwarzenegger’s “Terminator,” to the banal *Left Behind* series (LaHaye and Jenkins 1996, 1997, 1998, 1999, 2000a, b, 2001a, b, c, d, e, 2004a, b). Sometimes, a genius like Don DeLillo explores apocalyptic themes in ways that bring new meaning to old forms. In *White Noise* (DeLillo 1985), for example, a professor of “Hitler Studies” moves through traumatic history to nuclear threat, and in *Mao II* (DeLillo 1991) the narrator joins the cultic frenzy of the Moonies with immersion and death in Beirut terrorism of the 1980s. Some of our most perceptive contemporary philosophers are equally drawn to the power of the apocalyptic. How can they not notice it, since it defines the most terrifying and yet sublime levels of contemporary existence? It is not surprising a new shelf of books on 9/11 has appeared filled by Jacques Derrida in 2003 (*The Work of Mourning*), Paul Virilio in 2005 (*Ground Zero*), and Giovanna Borradori in 2004 (*Philosophy in a Time of Terror*), among many others.

Hope lies in the idea of totalistic redemption. Our own successful nineteenth-century experience of abolitionism would have been

inconceivable without its apocalyptic undertow, as I have argued in *Apocalypse* (Strozier 1994). In Christian theology, as Catherine Keller has argued (1997, xi–xiv), people as diverse as Daniel Berrigan and liberation theologians from Allan Boesak, Elisabeth Schussler Fiorenza, and Pablo Richard read the *Book of Revelation* as a call for the oppressed to overthrow the world in their own image. Lois Ann Lorentzen (1997), in turn, describes the apocalyptic nature of the environmental activism of Earth First!, and one could add that of PETA and the very interesting and hopeful movement of antiglobalists among young people all over the globe. Even on the less psychologically stable fringes of this movement, among the millions of those who feel they either have been abducted by UFOs or have faith in the truth of the phenomenon, the feeling among many, as the late John Mack (1995) of Harvard described it, alien beings outside of our familiar Cartesian world are attempting to save us from our path of destruction toward collective death. Finally, people such as the German theologian, Jurgen Moltmann (1993), in *The Theology of Hope* argues for a renewal of Christian eschatology in his read of Revelation, and Catherine Keller (1997) argues passionately in *Apocalypse Now and Then* and in many subsequent essays, that the *Book of Revelation* is a text of hope, filled with dark and ominous images, especially against women, but that the wild and poetic flux of end-time images must be yoked toward our salvation.

But nor can we ignore the malevolent power of the apocalyptic and its role in the creation of “atrocious-producing narratives,” as Robert Jay Lifton (1973, p. 65) has put it. The *Book of Revelation* is in this sense a very dangerous text. It is filled with images of blood running up to the bridles of the horses, of seals opening to death, of trumpets blowing violence, and of vials pouring forth destruction in three great sequences of sevens, each linked forward and backward at the end points of destruction. Revelation is a story of biblical genocide, with God acting, in the words of James Jones (2006), as a “Divine terrorist.” There is a logic to our aspirations toward sacred, apocalyptic redemption. Dispensing of

the other in collective ways, something we call genocide, grows out of an intensely felt idealistic and moral commitment to make the world better, as Lifton has argued (1961, pp. 433–437). People commit individual violence for all kinds of idiosyncratic reasons, but it is the deeply idealistic goal of changing history, of correcting it, of purifying it racially and ethnically that leads to genocide. And for the most part, those who carry out exterminatory projects feel they are acting on behalf of a messianic goal or on behalf of God’s end-time purposes in the world or some variation of these motivations.

The text of Revelation is presented as a dream, which is why John writes it in the past tense, and it moves quite logically from the release of great violence at the hands of an angry God to final redemption in Chapters 19 through 22. Revelation is also a survivor narrative, for the text proves simultaneously the death and torment of the other and the salvation and redemption of the elect. There are, of course, many survivor narratives, and some can become paradigmatic of the hopeful for all time. But in the apocalyptic as we know it from the *Book of Revelation*, the survivor narrative gets corrupted and turned into violence as it gets totalized or turned into an absolute story of redemption.

Apocalyptic or endist narratives, however, are not one thing and certainly are not restricted to the *Book of Revelation* but have themselves evolved historically, from the Egyptian *Book of the Dead* in the thirteenth century BCE to the early Zoroastrians some six centuries later, to the author of the *Book of Revelation*, John of Patmos in 95 CE, and to Joachim of Fiore (1135–1202) in the Middle Ages. But in no way have apocalyptic ideas emerged more importantly than in our recent historical discovery of the ultimate power of destruction with nuclear weapons and increasingly with other biological agents. Nuclear and other ultimate weapons have changed us psychologically and spiritually in ways we are just beginning to understand. We do not need God anymore, as we have since the beginning of culture, to carry out the end. The agency shifts. Ultimate power of destruction, which along with creation is the

essence of God's divine power, is now in human hands.

Apollo

David A. Leeming

University of Connecticut, Storrs, CT, USA

Blanton-Peale Institute, New York, NY, USA

One of the most important of the Greek gods, Apollo was the son of the high god, Zeus, and the Titan, Leto. Apollo's twin sister was Artemis. Apollo was the god of light and reason. He was associated with music and the other arts. By defeating the Python, a mythical relative of the old Mother goddess at Delphi, Apollo became known as Pythian Apollo. His defeat of the old power, like his overruling of the same power represented by the Furies at the trial of Orestes for matricide, establishes him as the symbol of patriarchal order at the center of the classical Greek worldview. That order was based on the mind rather than emotion, on reason, moderation, balance, and form as opposed to what was seen as the old chthonic chaos. If the old female power was of the earth and its mortality, Apollo's was of the sky, heaven, and its eternity. In his attention to social order, Apollo's concerns are not with

individual worth, but with “higher values.” To quote mythologist Walter Otto, “The sense of his manifestation is that it directs man’s attention not to the worth of his ego and the profound inwardness of his individual soul, but rather to what transcends the personal, to the unchangeable, to the eternal forms” (Otto 1954, p. 78).

“Know thyself” was Apollo’s motto. As Sophocles’s great Oedipus plays remind us that motto does not refer to deep individual searching but to a public grappling to a sense of one’s place in a larger world of divine and social priorities and realities.

The killing of the Python is crucial to the psychological identity of Apollo. The Python, as the representative of the earth goddess Gaia, the first deity to emerge from Chaos “in the beginning,” has contact with the depths of the underworld, representing for us the chaotic unconscious. She is the logical victim of the god who takes over the Pythian oracle at Delphi and represents intellect, analysis, and consciousness. In today’s world Apollo stands out on one hand as the anti-depth psychologist, concerned not with the inner self but with learning one’s place in society. In another sense, he *is* the model of the process by which the unconscious is “conquered,” brought to the light of day, and of the ego in complete control over the demands of libido and superego.

Apollonian and Dionysian

David A. Leeming

University of Connecticut, Storrs, CT, USA

Blanton-Peale Institute, New York, NY, USA

Since Friedrich Nietzsche discussed the Apollonian-Dionysian dichotomy in his *The Birth of Tragedy*, the dichotomy has been extensively applied by philosophers, by theologians, and especially by literary critics to discussions of an essential conflict between two human impulses or ideals symbolized by Apollo and Dionysus in Greek mythology.

Terms generally applied to Apollo are reason, order, intellect, form, moderation, and consciousness. It was Apollo, the god of light, who defeated the primordial goddess-empowered Python and installed himself as the source of oracles at the sacred precinct of Delphi. The defeat of the Python represents the classical Greek patriarchal culture’s defeat of the old chthonic and chaotic goddess power of Gaia, the firstborn of Chaos in the Greek creation myth.

Dionysus was associated with the Earth and the world rather than the sky and the heavens. He was, like Apollo, a son of Zeus but only a marginal Olympian. He was the “Mad God,” associated with ecstasy and chaotic emotions. Dionysus is the god of the grape, of drunkenness.

It has become usual to suggest in various contexts that both the Apollonian and the Dionysian impulses need to be celebrated and kept in a state of balance. A work of art that is all form and no emotion is by definition inferior. The same could be said of a marriage or an athlete’s approach to sport. Nietzsche, in his discussion of tragedy, recognized the necessary tension achieved by the presence of both the Apollonian and the Dionysian. Scholars remind us, in fact, that Dionysus and Apollo in ancient Greece were not necessarily seen so much as opposites as parts of a whole. In fact, as Apollo spent part of the year at Delphi – the navel of the Earth – Dionysus spent the other part there.

In terms of human psychology, the Apollonian aspect of our psyches is that which emphasizes

order and self-control. That side is balanced by the Dionysian need to experience the emotional depths. Apollo, the god whose motto is “Know thyself,” is the ego overcoming the chaotic elements of the unconscious so that an ordered, sane life can be lived. Dionysus is the need to delve into that unconscious and to experience its chaos before true individuation or wholeness can be achieved. As Dionysus descended to the Underworld and returned, the voyager into the unconscious can hope for a rebirth into an Apollonian self.

Apotheosis and Return

Alice Mills
University of Ballarat, Ballarat, VIC, Australia

Monomyth

According to Joseph Campbell’s monomyth model of the hero-quest in *The Hero with a Thousand Faces*, there is a variety of ways in which a quest can end. The quest does not proceed at all for the person who steadfastly refuses the call to adventure. The hero may die at various points, especially during descent to the underworld. At the climax of the quest, apotheosis may occur as the hero transforms to a god. If the quest story completes the monomyth cycle of events, the hero experiences a return to society which may prove

difficult. Reintegration to the familiar world of family, friends, and ordinary everyday reality is hard on both sides, for the hero who has experienced the life-changing events of the quest and for those who have remained at home with little or no idea of what the hero has undergone.

Religion

In terms of religious experience, the equivalent to the hero’s difficult return is to be found in life after conversion. Religious conversion involves the overthrow of previously held values, beliefs, and attitudes. Having gone on this religious hero-quest and gained their spiritual treasure, converts are then likely to face the difficulty of rejoining a society that either does not comprehend or is actively hostile towards their transformation, unless they choose to renounce their earlier social and familial ties altogether. Full reintegration is not possible, as it would entail renouncing the spiritual insights gained in conversion. Remaining true to those new spiritual beliefs may well mean encountering persecution. The convert’s sense of assured meaning and purpose in life can be found particularly vexatious when it clashes with a well-established faith that the convert once subscribed to: of such clashes are martyrdoms made.

Boundary Issues

An equivalent to hero-quest apotheosis can be found in religions that seek for enlightenment. As Campbell discusses, in Mahayana Buddhist belief the Bodhisattva Avalokiteshvara chooses to remain on the threshold of apotheosis until all sentient beings attain the state of enlightenment. Enlightenment is apotheosis not in terms of physical transformation but in attaining a godlike state of wisdom. According to the practitioners of Voodoo, the gods mount their human carriers without transforming them in rituals which might be understood as temporary apotheoses. Another form of apotheosis is the divine vision to which the lives and writings of mystics in many religious traditions bear witness. While apotheosis is

usually a permanent transformation from mortal to divine in myth, in religious experience it is described as a temporary union of deity and human. The three religions of the book, Judaism, Christianity, and Islam, are wary of apotheosis, despite their wealth of mystical writings. Part of this wariness about claiming even temporary unity between god and human derives from the Old Testament deity's denunciation of other deities. In Islam, the mystical Sufis have long been persecuted as heretics. Among Christians, wariness of apotheosis stems in part from the blood-stained history of heresy, in which devout practitioners of theologically divergent faiths each calling itself true Christianity persecuted and attempted to annihilate one another. Theological battles raged, and lives were lost, over the question of whether Christ was true man who experienced apotheosis and became god at some time during his mortal life, or true god who only appeared to be a mortal man, or simultaneously true god and true man. It was this latter doctrine that became Medieval Latin church orthodoxy in the Nicæan Creed, ruling out apotheosis as an interpretation of Jesus' life and death.

Psychology

Psychologists are likewise wary of claims of apotheosis. Those human beings who assert their divinity in the secular Western world are likely to be diagnosed as mentally ill and to have their symptoms controlled with drugs. Jung warns of the dangers of inflation, which he defines as occurring when a human being identifies too closely with an archetype. The problems of return from the hero-quest and reintegration into society are well-recognized issues in psychotherapy. The person seeking therapy, understood as engaging in inner quest work to examine, recognize, and alter destructive patterns of behavior, may well succeed in self-transformation, profoundly altering understandings of self and the world, changing beliefs, attitudes, and values. On their return, these heroic venturers into the depths of the psyche are likely to behave very differently towards their families

and friends. They may be welcomed with approval or rejected, even persecuted, and they may find that they can no longer live in the old way, stay in the same relationships, keep the old friendships alive, or slot back into their jobs. Whether the difficulties come from within or without, once a person has deeply changed in psychotherapy, complete reintegration into the old ways of living is no longer possible. For the therapy client as for the mystic and the quest hero, the end of the process can bring active persecution or lonely suffering along with joys beyond the imagination of those who have not traveled that path.

Archetypal Cultural Psychology

Lee W. Bailey

Department of Philosophy and Religion, Ithaca College, Ithaca, NY, USA

The analysis of culture using Carl Jung's archetypal theory, as distinct from clinical practice, is widespread. Following Freud, he directed thinking in the wholly new path of looking at the unconscious factors not only behind individual but also behind collective cultural phenomena,

from religion to gender. He rejected Freud's excessive emphasis on sexuality and his rejection of religion, that Freud called an illusory infantile father complex. As Jung developed his theory of the collective unconscious, he saw more archetypal themes in culture.

Jung saw that *myths* are not just illusory fantasies to be disposed of by rational thinking, but are highly symbolic. As Freud had seen deeply into the Oedipus and Narcissus myths, Jung saw the deep meaningfulness of patients' dreams and fantasies and flung open the doors to interpreting all myths. He looked into astrology; Greek myths such as Hermes the trickster; Roman myths such as Mars, God of war; feminine Sophia as gnostic wisdom; and mythic figures such as magicians, witches, and animals. He saw the gods as not just metaphysics, but as psychic factors, and sometimes as illnesses. Extending Jung's insights, Joseph Campbell (1949) wrote the popular *The Hero with a Thousand Faces*, Maureen Murdock (1990) wrote *The Heroine's Journey*, Clyde Ford (1999) wrote *The Hero with an African Face*, Carol Pearson (1986) wrote *The Hero Within*, and David Leeming (1998) wrote *Mythology: the Voyage of the Hero*. Archetypal views have made a strong impact on myth studies (Walker 2002).

An in-depth archetypal analysis of *The Grail Legend* was undertaken by Emma Jung and Marie-Louise von Franz. Von Franz wrote several important books that blazed the trail of the archetypal analysis of folklore, such as *The Interpretation of Fairy Tales*, (1970a) *Creation Myths*, (1972) Apuleius' *Golden Ass*, (1970b) which includes the nugget text on Eros and Psyche, and projection in *Projection and Re-Collection in Jungian Psychology*, (1980) Susan Rowland (2010) wrote a survey of *Jung and the Humanities*, David Tacey (2001) wrote *Jung and the New Age*, and many studies of the mandala have been published (Fig. 1).

Jung's culminating mythic insights, following his 1944 visionary near-death experience (1961), were to open the doors to alchemy. He showed it to be not just pre-chemical mumbo jumbo, but to be mystical, mythical language of alchemical

Archetypal Cultural Psychology, Fig. 1 Arabic mandala symbolizing Allah as the center of Islam. (Granada, Spain, photo courtesy of the author)

adepts projecting their soul transformations into matter symbolically: *hieros gamos* (sacred marriage), metals, *prima materia*, salt, and Saturn, for example. He saw the transformation of Saturn's psychic lead or excrement – shadowy depression and old age – into the treasure of gold's divine self (Jung 1979, Vols. 12, 13, 14). This reinforced his major therapeutic insight that shadow archetypal images, when processed, can reveal a treasure, personally and culturally.

Authentic *religion* for Jungians is not discovered in logic, tradition, or dogma, but in *experiences* of the self in dreams, visions, culture, and nature. One of Jung's patients, a secular Jewish girl, had repressed her grandfather's being a Hassidic Zaddik (mystic). She thought this to be irrelevant, until Jung explained: "You have your neurosis because the fear of God has got into you. This struck her like a bolt of lightning." He told her that he had a dream of her as a goddess, and beneath her surface was the making of a saint. He awakened the numinous self in her, and in a week her neurosis was gone (Jung 1964b, pp. 138–40).

Religions are ways of integrating the collective unconscious into consciousness. Jung portrayed the central archetypal self, symbolized as the mandala and many other ways, as an archetypal

psychic aspect of divinity that regulates struggles. The goal of the ego is to serve the higher purposes of the self, individually and culturally, as Edward Edinger (1973) stressed.

Jung interpreted religions as collective mythic constellations. Gods can be seen as psychic factors – compassion, justice, or war. This important move frees religion from blind literalism, dogmatism, and fundamentalism that must be taken on faith. Numinous primordial psychological images become revelations. He moved beyond the subjectivist error of Freud, stuffing it all into subjective psyche as illusion. And Jung says that Nietzsche's cry that "God is dead" brings inflation. Despiritualizing the world exaggerates ego's illusions of power, so former demons become cultural monsters, like world wars. Plus, the archetypal femininity of Mary should be added to the Christian Trinity to start balancing the patriarchal imbalance (Jung 1979, Vol. 11, para. 122–24).

Jung struggled with the problem of the biblical Job, as a mythic image of the problem of *Evil*. Job's dilemma is: why do we suffer, if God is supposed to be omnipotent and benevolent? Judaism and Christianity could not adequately solve this by splitting divinity into pure goodness in Heaven and Evil in the Devil. He saw Christ as an example of the self humanized and overcoming suffering, as the answer. But Christianity is not enough. Christianity failed to deal with WWII, because it was an eruption of powerful repressed pagan divinities, mainly Wotan in Nazi culture. Jung's "heresy" was that God has a shadow – it is the world's suffering, too often in the name of some god (Jung 1979, Vol. 11, para. 408–09). Religion absorbs shadow elements, such as suffering, death, authoritarianism, war-mongering patriotism, and oppression of femininity. These are shadows of God. This imbalance is now being shifted with the development of democracy, goddess theology, women pastors and priests, and the re-enchantment of the world – seeing sacredness in nature. But suffering will never be fully overcome in this mortal world. War especially still needs work. James Hillman (2004) said this in *A Terrible Love of War*. War, he says, is normal, inhumane, sublime, and religious.

Jung explored the psychology of many world religions – Buddhism and *The Tibetan Book of the Dead*, the *I Ching*, Taoism's *The Secret of the Golden Flower*, Gnosticism, and the Hindu Ramakrishna, Kundalini, and Tantra. John Dourley (1984) wrote a challenging book, *The Illness that We Are: A Jungian Critique of Christianity*. David Miller (1975) wrote *The New Polytheism*, showing the many gods at work under the surface collective monotheism. Mircea Eliade drew on archetypal theory for his major studies of world religions (1958).

On *gender*, Jung reintroduced the Chinese yin/yang view of gender, that there is some male in every female (*animus*) and some female in every male (*anima*). The cultural impact of this archetypal pattern helps deconstruct gender stereotypes. Jung explored many themes that became major issues subsequently in feminism. Many Jungians have written gender studies, such as Erich Neumann (1955), who wrote *The Great Mother*. Ann Ulanov (1971) wrote *The Feminine in Jungian Psychology and Christian Theology*. Ann and Barry Ulanov (1994) wrote *Transforming Sexuality*. Robert A. Johnson wrote *He*, (1989) *She*, (1976) and *We*. (1983) Jean S. Bolen (1984) wrote *Goddesses in Every Woman*. Robert Moore and Douglass Gillette (1990) wrote *King, Warrior, Magician, Lover: Rediscovering the Archetypes of the Mature Masculine*. Robert Hopke (2001) wrote *Jung, Jungians and Homosexuality*.

Jung the psychologist could not avoid dabbling in psychological side of *philosophy*. He saw the Kantian view of the rationalist *a priori noumena* (such as time and space) more psychologically as archetypal instincts and *phenomena* as both symptoms and the collective images and myths that take form in culture (Jung 1979, Vol. 11, p. 840). He could see through the materialist presuppositions of rationalism, but he only began to let go of the Cartesian inside/outside metaphysics of psychology as he went through his alchemical studies. He was fascinated with Levy-Bruhl's participation mystique as a way through this dilemma. He devoured Nietzsche's works as a way into the Dionysian passionate madness and power instinct of Western culture. Jung relished

Thus Spake Zarathustra and the Superman in Western ego. He agreed with Nietzsche's vision that the cultural God is dead. He explored Plato, whose forms, like the theoretical perfect circle, are background to Jung's *a priori* archetypal psychological instincts and patterns, but with more feeling. He found allies in Plutarch, Pythagoras, Schopenhauer, and Bergson. Jung found parallel themes in phenomenology, such as the intentionality of existence, returning to experience, and hermeneutic interpretation (Brooke 1991). David Ray Griffin (1989) edited a comparison of archetypal psychology and process philosophy in *Archetypal Process*.

On technology seen archetypally, Robert Romanyshyn (1989) wrote *Technology as Symptom and Dream* and Lee Bailey (2005) wrote *The Enchantments of Technology*.

In the cultural realm of *art and literature*, Jung saw in many artists such as Dante, Goethe, Wagner, Joyce, and Picasso, the creative workers with dreamlike images and myths emerging from deep in the soul. This frees art from being an accessory to materialism, to a being guiding force in the soul's expressions of archetypal forces. Dante shaped the medieval Christian vision of the after-life world. At the end of the era of industrialism, Jung in 1932 saw the maddening genius James Joyce's *Ulysses* as a boring surface exploration of modern consciousness – its creative, insane, boring “grotesque objectivity.” He rudely insulted expectations of common sense, with his “spiritual nihilism,” Nietzschean “backside of art,” “sheer negation,” and “a consciousness detached from the object,” where nothing happens and no characters go anywhere. Jung saw in it a hopeless “atrophy of feeling that does not shrink from any depth of absurdity of cynicism.” He cried: “O *Ulysses*, you are truly a devotional book for the object-besotted, object-ridden white man!” (Jung 1979, Vol. 15, Chap. V, paras. 163–203, *Ulysses*: A Monologue).

And Picasso, oh, Picasso, the brilliant bad boy of modern visual art. Jung's psychological view of him as another artist who discards the outside world to picture the rumbling unconscious of 1932 and later – the ugly, sick, and grotesque, as in the major critique of the first airplane bombing

of civilians, *Guernica* – the doomed and decaying industrial world dissolving into despairing fragments. Picasso's journey to the underworld brings back the spiritual, the harlequin, the mothers, and the lovers but also the bull man, the bestial image that “gives you the creeps,” bursting the shell of the premodern brain (Jung 1979, Vol. 15, Chap. V, paras. 204–214, Picasso).

Jung's deep exploration of the collective unconscious shows that industrial culture's mankind suffers from a remarkable lack of introspection. “He is blind the fact that, with all his rationality and efficiency, he is possessed by “powers“ that are beyond his control. His gods and demons have not disappeared at all; they have merely got new names” (Jung 1964a, p. 71).

Archetypal Symbolism

Charlene P. E. Burns

Department of Philosophy and Religious Studies,
University of Wisconsin-Eau Claire, Eau Claire,
WI, USA

Although most commonly associated with Carl Jung (1875–1961), the concept of archetypal symbolism had its origin in the work of German anthropologist and ethnologist Adolf Bastian (1826–1905). Bastian argued that there is an underlying cognitive unity among humanity which accounts for the similarity of basic ideas that appear cross-culturally. These *Elementargedanke*, elementary ideas, take on particular shapes in different cultures due to being influenced by geography (Kopping 2005).

Jung modified and extended Bastian's concept in the context of analytic psychology, giving us

what is today the most common understanding of this theory. The archetypes in Jungian thought are inherited patterns of instinctual behavior arising from the collective unconscious, which is a repository of the universal “ancestral heritage of possibilities of representation” containing the “whole spiritual heritage of [hu]mankind’s evolution, born anew in the brain structure of every individual,” (Jung 1968) that account for the common themes in humanity’s dreams, myths, and legends. They are “the hidden foundations of the conscious mind . . . the roots which the psyche has sunk not only in the earth in the narrower sense but in the world in general” (Jung 1927).

Historian of religions Mircea Eliade (1907–1986) and mythologist Joseph Campbell (1904–1987) were deeply influenced by Jung and theorized that “It is in the history of religions that we meet with the archetypes, of which only approximate variants are dealt with by psychologists and literary critics” (Eliade 1961). Campbell wrote extensively on the many religious themes and symbols which appear across times and geographies, and his work has had a powerful influence on scholars of religion to the present day. A few examples of symbols identified by Campbell and explored by scholars of religions today will suffice to underscore the ubiquity of common religious themes.

While associated today with Nazi Germany, the swastika, or hooked cross, is a very ancient symbol, dated variously to at least 6,000 years ago. The Sanskrit *svastika*, well-being, comes from the Vedas, Hinduism’s most ancient collection of scriptures. In some religions, the four-legged symbol rotates in clockwise form; in others it rotates counterclockwise. In Hinduism it symbolizes good luck, the sun, and Brahma, the creator god. In Chinese Taoist thought, it symbolizes eternity, and in Tibetan Buddhism (counterclockwise rotation), it symbolizes the eternal, indestructible path of the Buddha. In Indian traditions, a clockwise rotation (right turning) swastika signifies the god, and the counterclockwise (left turning) is associated with the goddess (Beer 2003). Clockwise-rotating swastikas have been found in ancient rock paintings, basket weavings, and jewelry among numerous Native American groups, including the Navajo,

Apache, and Hopi. In Christianity, the counterclockwise swastika was sometimes used on grave-stones and has been found in the catacombs of ancient Rome.

The Mother archetype is truly a universal symbol, finding expression from ancient Greece to modern Christianity. In Greek mythology, Gaia, Mother Earth, is the ancestral mother of all life. The mother archetype in Hinduism is expressed in various forms, including Durga and Kali. For the Maori, creation came about through the union of the Earth Mother and the Sky Father. The Mesopotamians worshipped Tiamat as both creator goddess and embodiment of the chaos that preceded creation. The ancient Celts worshipped Dea Matrona, the divine mother. In Inuit mythology, Sedna is Mother of the Sea, and in Catholic Christianity, Mary is Mother of God, Queen of Heaven. Other archetypal symbols found in many religions include the virgin birth of a heroic/savior figure, resurrection, rebirth, and the sacrifice of the hero.

Even if it is striking how widespread so many of the religious myths and symbols are, the appeal to archetypal symbolism is not without critics. Campbell has especially been criticized regarding his insistence that the commonality of themes among religions proves that there is an underlying unity of all things: “Dissolving, the ethnic ideas become transparent to the archetypes, those elementary ideas of which they are no more than the local masks (Campbell 1988).” This reduction of all myth to an ahistorical psychological manifestation oversimplifies history and religion and allows Campbell to make religious narratives, myths, and legends mean whatever he wants them to mean (Ellwood 1999).

Archetype

Ann Casement

British Jungian Analytic Association,
London, UK

Archetype is one of Jung's *tWho Owns Jung* two "signature concepts" according to the Jung scholar, Sonu Shamdasani, the other being the *collective unconscious* with which it is closely linked. Jung states that the collective unconscious is the part of the psyche that can be negatively distinguished from a personal unconscious as it does not owe its existence to personal experience. Whereas Jung's notion of the personal unconscious consists for the most part of *complexes*, the content of the collective unconscious "is made up essentially of *archetypes*" (Jung 1959: 42).

Jung first used the term "archetype" in 1919 in *Instinct and the Unconscious*. In that paper, he

claims there is good reason for supposing that archetypes are the unconscious images of the instincts themselves; in other words, they are "*patterns of instinctual behaviour*" (Jung 1959: 44). He goes on to say: "There are as many archetypes as there are typical situations in life" (Jung 1959: 48). In Jung's model, unconsciousness rests on a spectrum with the archetype at the ultraviolet end and instinct at the infrared end. The two struggle and intermingle with each other in unconsciousness to form units of energy and motivation that manifest in ideas, images, urges, and strivings. From this, it may be deduced that the psyche is located in the space between instinct and archetype, matter and spirit, the body and the transcendent mind. "Psychologically, however, the archetype as an image of instinct is a spiritual goal toward which the whole nature of man strives" (Jung 1960: 212).

In his thinking about the problem of archetype and instinct, Jung turned to philosophy from antiquity as the following quotation indicates: "From Plato's high valuation of the archetypes in his theory of forms, which was maintained through to medieval philosophy, the archetypes had been reduced by Kant to a few categories" (Shamdasani 2003: 242). Jung frequently links his theory on archetypes to Plato's "eternal, transcendent forms" (Jung 1959: 33).

From the quotation in the above paragraph, it would appear that Jung was dismissive of Kant. This was far from the case as Jung turned to Kantian philosophy to distinguish between "the archetypic representations, and the archetype itself, similar to Kant's *das ding-an-sich* (the thing-in-itself) which is irrepresentable" (Shamdasani 2003: 260). Kant's theory of knowledge divided human cognition into what it could grasp, viz., the phenomenal world, and what it could not. The latter, Kant termed the noumenal world – the a priori, timeless, spaceless, and causeless entities both within and outside the mind. Jung linked Kant's thinking on the a priori entities to his theory of archetypes, thus locating this theory in the interface between the metaphysical thinking of Plato and the logical categories of Kant's philosophy.

Jung went on to claim that the *archetypic* image, or primordial image as it was first called by him, is frequently met within mythology and the great religions. The irruption of these archetypic images from unconsciousness into the conscious realm may be viewed as the basis of religious experience and of the need for the mysterious and symbolic that underlies the quest for what Jung calls *individuation*. As Jung states: “When...modern psychotherapy once more meets with the activated archetypes of the collective unconscious, it is merely the repetition of a phenomenon that has often been observed in moments of great religious crisis” (Jung 1953: 36).

According to the analytical psychologist, Anthony Stevens: “Jung took the term ‘archetype’ from the *Corpus hermeticum*...where God is referred to as the archetypal light” (Stevens 2006: 79). “With his theory of archetypes operating as components of the collective unconscious, Jung sought to define the living bedrock of human psychology” (Stevens 2006: 74). The analytical psychologist Murray Stein’s definition of the term archetype is that *typos* means stamp and *arche* means the original or master copy.

Bipolarity of the Archetype

An important influence on Jung’s discovery of the bipolarity of the archetype was the pre-Socratic thinker, Heraclitus, whose notion of opposites is expressed in the term *enantiodromia*. This may be viewed as a natural law that denotes running contrariwise so that eventually everything turns into its opposite. Jung equated this with an archetypal way of behaving and states: “True opposites are never incommensurables; if they were they could never unite...God himself (is defined) as a *complexion oppositorum*” (Jung 1960: 207).

Jung further conceived of archetype and instinct as opposites in the following manner: “Archetype and instinct are the most polar opposites imaginable, as can easily be seen when one compares a man who is ruled by his instinctual drives with a man who is seized by the spirit...They belong together as

correspondences...they subsist side by side as reflections in our own minds of the opposition that underlies all psychic energy” (Jung 1960: 206). To underline his thinking of archetype as spirit, Jung goes on to state that: “The essential content of all mythologies and all religions and all isms is archetypal” (Jung 1960: 206). From this, it may be deduced that both archetype and instinct are deeply implicated in religious and ethical questions, which Jung affirms as follows: “Confrontation with an archetype or instinct is an *ethical* problem of the first magnitude” (Jung 1960: 208) (original italics).

In Jung’s approach, spirit and instinct are united symbolically in the archetypal form of the alchemical *hieros gamos* or higher marriage of opposites. “...the symbolic has the great advantage of being able to unite...incommensurable factors in a *single* image. With the decline of alchemy the symbolical unity of spirit and matter fell apart, with the result that modern man finds himself uprooted and alienated in a de-souled world” (Jung 1959: 109).

Another pair of archetypal opposites, *anima/animus*, is relevant here as follows: “The archetypal images that link the self and ego-consciousness form a middle realm, which Jung calls *anima* and *animus*, the realm of soul. In Jung’s view, polytheistic religions stem from and represent the realms of the anima and animus, while monotheistic religions base themselves on and point to the self archetype” (Stein 1998: 102–103) (original italics).

The Phenomenological Approach to Archetype and Religion

A group of scholars called *Eranos* under the leadership of Jung gathered together in an annual gathering, including the Romanian-French historian of religion, Mircea Eliade. He was a phenomenologist, who was interested in uncovering the archetypal structures and patterns of religious life. In his writings on religion (*Patterns of Comparative Religion* 1958; *The Myth of the Eternal Return* 1954; *Shamanism: Archaic Techniques of Ecstasy* 1964), Eliade recognized a basic division

between traditional religions such as the archaic cults of Asia, Europe, and America and the historical religions of Judaism, Christianity, and Islam. The chief element in the former is the depreciation of history and the rejection of the profane, mundane world, combined with an emphasis on actions and things that repeat and restore transcendental models. Only those things that participate in and reflect the eternal archetypes, through which cosmos came out of chaos, are real in this way of thinking. The mode of expression in this model is in consequence recursive.

Post-archaic or historical religions such as Judaism, Christianity and Islam tend to see a discontinuity between God and the world and to locate the sacred not in the cosmos but beyond it. These hold to linear views of history in the belief that the meaning for humankind is worked out in historical processes, which are seen to have a purposeful plan. For this reason, the historical religions have been monotheistic and exclusivist in their theologies.

The following statements from Jung demonstrate his archetypal approach in relation to Eliade's writings on religion: "The life of Christ is understood by the Church on the one hand as an historical, and on the other hand as an eternally existing, mystery... From the psychological standpoint this view can be translated as follows: Christ lived a concrete, personal, and unique life which, in all essential features, had at the same time an archetypal character" (Jung 1958: 88). He says Catholicism "gives the archetypal symbolisms the necessary freedom and space in which to develop over the centuries while at the same time insisting on their original form" (Jung 1958: 465). Again "...archetypal situations only return when specifically called for. The real reason for God's becoming man is to be sought in his encounter with Job" (Jung 1958: 397).

Criticisms and Revisions of the Theory of Archetypes

Jung's theory of archetypes has been the object of criticism from many sources, including the French structural anthropologist, Lévi-Strauss, as

summarized in his view that it is possible to "dispose of theories making use of the concept of 'archetypes' or a 'collective unconscious'" (Lévi-Strauss 1996: 65). He accuses Jung of attempting to find universal *contents* in his concept of archetypes but, as the analytical psychologist, Wolfgang Giegerich, says of Jung's later thinking: "He (Jung) is no longer concerned with any substance, any entity...he simply expresses the abstract notion of the oppositional *structure* or *form* of the psychic...*What* the opposites are is here not said, and it cannot, should not be said in the context of this late work (*Mysterium Coniunctionis: An Inquiry Into the Separation and Synthesis of Psychic Opposites in Alchemy*), because this would be a relapse into the substantiating style of thought that this title has long left behind" (Giegerich 2007).

Brief summaries of the views of two analytical psychologists, George Hogenson and Jean Knox, whose work represents major revisions of archetypal theory, will be reproduced here. Lack of space prohibits elaboration of the important work of other writers in this area such as the analytical psychologists Joe Cambray, who views archetypes, as well as various other key aspects of Jung's approach, as emergent properties from the complex interaction of the psychic system with the world, and Patricia Skar, who takes a similar line and goes on to suggest that archetypes are the early products of developmental self-organization and should be considered to be a special category of complex.

George Hogenson asks the key question: What architecture of mind is best suited to underwrite the theory of archetypes? His conclusion is that viewing cultural patterns as innate is "what most Jungians would recognize as archetypes" (Hogenson 2003: 108). Hogenson disagrees with this and proposes, instead, a less a priori structure of the mind. This is based on his study of robotics and dynamic systems theory whose "research paradigms conflict with the notion that strongly innate or a priori internal representations of the world are necessary to explain complex behaviour" (Hogenson 2003: 109). Hogenson's interest in Baldwinian evolution (named after the psychologist, James Baldwin,) is succinctly expressed by Terence Deacon, Professor of

Biological Anthropology and Linguistics at the University of California at Berkeley, who is quoted by Hogenson as follows: “Baldwin proposed that by temporarily adjusting behaviors or physiological responses during its lifespan in response to novel conditions, an animal could produce irreversible changes in the adaptive context of future generations. Though no new genetic change is immediately produced in the process, the change in conditions will alter which of the existing or subsequently modified genetic predispositions will be favored in the future” (Hogenson 2003: 110).

Jean Knox points to the convergence in recent times of cognitive science, neuroscience and psychodynamic theory in recognizing the self-organization of the human brain whereby genes do not encode complex mental imagery and processes but “...instead act as initial catalysts for developmental processes out of which early psychic structures reliably emerge” (Knox 2004: 4). Furthermore, “Archetypes are not ‘hard-wired’ collections of universal imagery waiting to be released by the right environmental trigger” (Knox 2004: 4). Instead, she posits that archetypes as emergent structures play a key role in psychic functioning and symbolic imagery. The way archetypes have often been portrayed is that there is information stored in a genetic code waiting “like a biological Sleeping Beauty, to be awakened by the kiss of an environmental Prince. This...is frequently implicit in discussion about archetypes, in Jung’s own writings and in that of many former and contemporary analytical psychologists” (Knox 2004: 5). The gradual emergence of archetypal material in analysis may enable the coming into being of the capacity for symbolization.

The writers included in this last section are critical of any notion of archetypes as innate or coded in the genome in their rethinking of Jung’s theory of archetypes.

Arhat

Paul Larson

The Chicago School of Professional Psychology,
Chicago, IL, USA

In Buddhism, the term (Skt.) “arhat” (Pali “arahant”) refers to a person who has achieved realization or enlightenment, having attained a state of nirvana. It is the model for spiritual development in Theravada Buddhism, one of three branches of contemporary Buddhism, also known as the southern transmission, because the tradition went southward from India to Sri Lanka, then to Thailand, Burma, Laos, and Cambodia. In the Mahayana and Vajrayana traditions, the model of the arhat is replaced by the model of the bodhisattva.

The arhat is a fully realized being and upon death they do not return to the cycle of birth, death, and rebirth, the samsaric wheel of life. One attains this state through much dedication and effort, probably across many lifetimes. The earliest Buddhist scriptures, the *Tipitaka*, recount stories of how many of the monks who studied with the Buddha attained arhatship during their lifetimes.

There are four stages over which the already advanced practitioner reaches the final stage of release from the wheel of life. The “stream-enterer” is the first stage, the “once-returner” is the second, the “never returner” the third, and the arhat the fourth stage. In the experience of stream entering, the person is sufficiently well along in the path to actually taste the direct experience of (Skt.) nirvana or (Pali) nibbana. But the experience is fleeting because the mind-stream is not completely purified of the obscurations of attachment. As the mind is purified, the person achieves the degree of stability in the enlightened state of mind that they are only needing one more lifetime to complete the process, and in the non-returning stage, if one is reborn at all, it is into one of the higher realms, and for the arhat, the achievement occurs in this lifetime.

For many lay Buddhists in the Theravada tradition, it is recognized that to achieve enlightenment one needs to be able to devote much time to meditation. As a lay person, a “householder,” one cannot realistically hope to achieve that goal. What one can strive for is to gain sufficient merit over the course of this lifetime to have a better reincarnation next time and perhaps then to be able to release attachment to worldly things and focus on spiritual progression. By treating other sentient beings with “loving-kindness” (Pali “metta”) and above all by supporting the ordained sangha of monks and nuns through offering, one can gain much merit.

The basic means of achieving enlightenment is through the practice of meditation. In contemporary Theravada Buddhism, this involves the practice of vipassana (Pali) or insight meditation. This style of meditation is particular to Buddhism and is found in all three branches, Theravada, Mahayana, and Vajrayana. In the latter two traditions, it

is known as shamata, or calm abiding meditation. Vipassana is described in the Mahasatipatthana Sutta, part of the Tipitaka, or “three baskets” of Buddhist scriptures in the Pali language (Thera 1962).

Arminianism

M. Alroy Mascrenghé

Department of Religious Studies, University of Cape Town, Cape Town, South Africa

Definition

Arminianism is a system of Christian theology which, while admitting that salvation is entirely by God’s grace, emphasizes God’s decision to respect man’s response to his saving grace. The other alternative school of thought is Calvinism.

History

Jacobus Arminius (1559–1609) was a reformed Dutch theologian who studied under Theodore Beza in Geneva. His disagreements with the Calvinists began when he was serving as a pastor in Amsterdam. His refusal (in 1591) to defend the Calvinist doctrine of predestination was the beginning of a division that would continue for

centuries. When the plague struck Amsterdam in 1601, Arminius was convinced that the Calvinist doctrine of predestination, when pushed too far would bring anxiety and depression in believers (Leeuwen et al. 2009); since everything is already predetermined, there is little one could do to change anything. When he was a professor of theology at Leiden, Arminius repudiated the causative effect of God's foreknowledge. He argued that God's foreknowledge does not cause things to happen, it simply knows what's going to happen (Bangs 1985). The controversy between Franciscus Gomarus (another professor at Leiden) and Arminius started in 1604 when the latter started to teach his views on predestination publically.

Theology

Following John Calvin and Theodore Beza, Gomarus believed and taught double predestination – that in the same way God chose some for eternal life (election), he chose others for eternal damnation (reprobation). In either case, it is not because of something in them, i.e., God does not predestine anyone to heaven because they have faith in him, neither does he predestine anyone to hell because they are sinners; it is because of his holy will he is doing both. According to the Calvinists, God cannot depend on something other than himself.

Arminius also believed in predestination, but only in election and not in reprobation. He would not have God as the author of sin or evil but emphasized God's love and human freedom. He considered double predestination to be an insult to the view of God presented in the bible.

Arminius asked for a nationwide synod to sort out the theological differences and insisted that the Bible be the sole authority in the synods. However, others were not willing for this as they held onto the confessions *and* the Bible as their base. Revising the confessions was considered almost an unpardonable sin (Leeuwen et al. 2009). After the untimely death of Arminius in 1609, his followers and sympathizers produced a remonstrance (thus the name Remonstrants) to the

state of Holland in 1610 outlining their disagreement with Calvinism. The main five points of the remonstrance are:

- Article I – Conditional Election – God chose all those whom he foreknew would believe in Christ through the grace of the Holy Ghost.
- Article II – Unlimited Atonement – Christ died for everyone, but the effects of his death are applied only to those who believe.
- Article III – Will – Man by himself cannot think, will or do anything good.
- Article IV – Resistible Grace – The grace of God which turns a man towards Him can be resisted.
- Article V – Conditional Perseverance – While the latter Arminians believed in falling from the grace, the original Remonstrants made this a subject for further study – thereby opening the possibility that a saved person could fall from the grace.

Synod of Dort

Since the debate was causing a nationwide strife, a synod was finally called for in 1618, almost after a decade after the death of Arminius. The followers of Arminius were condemned and excommunicated by the Synod of Dort (1618–1619) which consisted of carefully chosen Calvinist members from Holland and other European countries. The Remonstrants saw the synod as an eyewash whose main goal was to condemn them as heretics. The verdict of the synod in no way stopped the Remonstrants from spreading their teaching. They went on to form the brotherhood of the Remonstrants ((Remonstrantse Broederschap) a church which exists till today – <https://www.remonstranten.nl>).

Legacy

Arminianism continued to spread across Europe, attracting proponents and opponents. Influenced by the ideas of Arminius, John Wesley stressed the need for a personal conversion and an experience of salvation. The need to say yes to God and

to allow Him to enter into one's heart was stressed as opposed to an irresistible salvation. Arminianism was also very much influential in the theology of Charles Finney, who used the altar call – which has been unfairly accused as a case of salvation by works.

Many Methodists, following John Wesley, stressed on a second experience after the initial Salvation. Different groups expressed this second experience in different ways. John Wesley believed in “Entire Sanctification” or “Christian Perfection” – in which the believer reaches a state where he can refrain from at least willful sins; this becomes possible by having a second experience. This gave birth to the Pentecostal movement which emphasized the “baptism of the Spirit” as a second experience. Very often the baptism of the spirit was accompanied by speaking in tongues and miraculous healing. Some critics, however, have dismissed them as psychological phenomena. Wesley influenced the birth of the Holiness, Charismatic and Pentecostal movements (Stephens 2010).

Open Theism is a recent branch of Theology which sees the future as open and argues that God does not know the future to combat theological determinism. While some have seen this as a natural branch of Arminianism, it must, however, be noted that classical Arminianism and Arminius himself, stressed the foreknowledge of God – God's ability to see the future. In this sense, Arminianism has more common grounds with reformed theology than with Open Theism. See Stanglin et al. (2014).

Today by far most Methodist, Wesleyan, Nazarene, Assemblies of God, Brethren and Free-will Baptist churches are Arminian in doctrine.

Misrepresentations of Arminianism

Arminianism has been unfairly accused of many things; the age-old accusation is that it is Pelagian – a doctrine which asserts that man can be saved by his own works; in a recent dissertation, the author accuses Arminianism as causing the famous “loss of will” (the absence of the discussion of the will in academia) in American psychology (Kosits 2004). Arminianism asserts the

biblical teaching that salvation is by grace through faith and does not promote a salvation by works. Even in Arminianism God takes the initiative. Man responds to the initiative taken by God. God foreknows how man would respond to his saving grace. So the starting factor is God's saving grace and then man responds.

Arminianism has also been accused of robbing God of his sovereignty. But as Roger Olson put it, God has the power to be ‘sovereign over his sovereignty’ (Olson 2014). He has the freedom to curb his sovereignty to give freedom to his creatures.

Psychological Impact

Arminianism has had a psychological impact on the way the believer feels about himself, God and the relationship between the two. It also heavily influences the way people interpret the bible.

For example, the belief that God expects man to participate in his work in bringing salvation to mankind has fueled many missions and evangelistic work. Conditional perseverance – the belief that salvation can be lost, has caused many to be watchful in their lives.

The following can be seen as examples of the ways in which the theological orientation influences the interpretation of scripture. Paul describes the psychological plight of a man who is having a moral dilemma in Romans chapter 7. He wants to be good and do good; however, he does not have the power to do it. The evil in him overcomes his desire to do good. The Calvinists interpret this as a believer's experience, because a non-believer cannot have the desire to do good (Rom 7.18) because he is totally depraved. The Arminians, however believe that it is the experience of the unconverted person. They also use the warning passages in Hebrews 6 and 10 as proof texts for the doctrine of conditional perseverance.

Arminianism and Psychology

The Arminian Christian Psychologists have generally been more open to secular psychological

theories and methods. David A Seamands (1922–2004), for example, a Methodist leader and a pioneering Christian counselor and psychologist made a happy marriage between secular psychological theories and biblical principles. In his books like the *Healing of Memories*, he used biblical as well as psychological principles in helping Christians deal with their psychological issues.

Art Therapy

Benson A. Mulemi
Department of Social Sciences, Anthropology
Unit, The Catholic University of Eastern Africa,
Nairobi, Kenya

Art therapy refers to the use of art as a central modality in psychoanalytic and psychosomatic treatment. Psychoanalytic clinicians may use this

therapy as an important form of expression in treatment through techniques that allow patients (and their caregivers) to express themselves and their emotions in health-seeking pursuits. In clinical consultation sessions and illness diagnosis, art therapy provides a chance for afflicted people to express themselves and facilitate communication of unspoken experience of physical and psychological distress. The experience of illness and other forms of suffering may lack language equivalents for their expression, which art therapy have the potential to adequately represent. Conceptualizations of art therapy also reflect perceived connection between artistic engagement and efficacious alleviation of psychosocial and biological infirmities (Stuckey and Nobel 2010).

Therapy in Art

The word therapy derives from the Latin term *therapia*, originally from the Greek word *therapeia*, which means treatment of disease and illness. In this regard, art therapy connotes both discipline and practices that bring art – the human creative capacity – to bear in formal and informal treatment settings. This entails complex processes and practices, linked with healing and restoration of health. Therapeutic processes that involve art elicit aesthetic and affective qualities of human creativity aimed at restoration and maintenance of individual and group or familial well-being.

Art therapy as engagement with artistic activities for remedying affliction or enhancing health can be interpreted from a three-tier perspective. First, individuals and their caregivers may benefit from the therapeutic effect of art as spectators of the creative efforts presented in art exhibitions, films, drama, music, dance, and other forms of art media. Second, an individual's engagements in art as an initiator of the creative efforts within and outside therapeutic settings have therapeutic potential. This is effective in situations where the participant either wittingly or unwittingly focus on enchantment of well-being through the creative activities. Third, art therapy comprises planned engagement in artistic activities by afflicted persons for therapeutic purposes in

treatment settings. Professional therapists, particularly art therapists, facilitate the treatment through art in the formal healthcare contexts.

Passive and direct participation in the creative efforts can enhance one's moods, emotions, and other psychological states and contribute to physiological well-being (Staricoff and Loppert 2003; Malchiodi 2005). Art therapy, like other forms of therapy in either clinical or nonprofessional settings, aims at bringing about change in human (health) disorder (Dalley 1984, p. xi). Patients particularly benefit from art when deliberate efforts are made to engage them in making art as part of illness diagnosis and therapeutic process (Selberg 2015).

Art and Disorder Diagnosis

Engagement with art in daily life or planned therapy sessions depicts inner self or interiority experiences. This may include expressions of emotional difficulties and the lived experience of physical infirmity. The perceived relationship between illness and the creativity in famous artists, for instance, underscores the possible use of art to infer health disorders, including neurological diseases, emotional distress, and psychic conflicts (c.f. Bogousslavsky et al. 2010, pp. vii–viii). In this sense, engagement with artistic work may be both an expression of inner personal experience that cannot be explained in ordinary language and a form of psychological defense mechanism and coping with perceived despondency. Creativity in drawing or painting, for example, constitutes a patient's diary of his or her lived experience of pain, suffering, despair, and the associated spiritual world (Sutter 2010; Meissner 1994). However, creativity through art does not necessarily offer a direct diagnosis of illness as the interpretation of art pieces or fragments as depicting emotional disturbance may not imply accurate connection to a disturbed personality (cf. Dalley 1984, p. xx). Art therapy could facilitate diagnosis when it can be strongly associated with expressive art. Art therapy from this perspective allows patients to express their lived experience of illness when words have lost

meaning with regard to the personal experience of both objective and subjective existential suffering (Selberg 2015; Abraham 2005).

Tacit responses to pathology through creative art accentuate the role of images in influencing emotions, thoughts, and well-being. Neuroscience relies on this understanding to demonstrate how visual, sensory, and expressive language of art is integrated into treatment (Malchiodi 2003, p. 22). Art provides effective symbols of communication in culture, which offers possibilities of alternative ways of facilitating diagnosis of health disorders drawing on unspoken messages. Psychoanalytic discourse, following the work of Jung (1983) underscores the role of art as a noteworthy medium for both unconscious and conscious communication. Art therapy thus mobilizes a patient's creativity to bridge the gap between the conscious and the unconscious realm of human experience (Case and Dalley 1992). The use of art in therapy therefore depends on the perceived efficacy of the creative art processes in health sustenance, diagnosis, and pursuits for holistic well-being and treatment of specific conditions (Rubin 2010).

Art and Physical, Psychosocial, and Spiritual Health

Preoccupation with art has the potential to mediate the mind-body-spirit connection to well-being (Malchiodi 2003, 2013). The complex creative and affective components of art and art therapy facilitate the healing processes, which relies on harmonious interaction among the human corporeal, psychological, and psychic experiences. Art in itself has therapeutic qualities that people can harness through either self-care or professional therapist assistance. When individuals engage in artistic creativity on their own, outside clinical settings, the process may be relaxing and therapeutic (Dalley 1984, p. xi). The efficacy of art therapy draws on the potential of various art forms and media to nurture personhood and wholeness as key aspects of health by influencing the human interiority or the "person within" a physical body (Leibing 2008).

The basic premise of art therapy practice is that the human interiority which is crucial to efforts to attain complete states of well-being is not accessible by other medical diagnosis and therapeutic processes. The positive impact of art on human well-being relates to its therapeutic value in fostering universal personhood: a perceived interiority through the aesthetic community (c.f. Selberg 2015, p. 489). Interiority of the corporeal human being entails the intangible spiritual component of being human which biomedicine and its diagnostic technologies may not access. Specialized healthcare subdisciplines and practice referred to with the suffix “therapy,” such as art therapy, physiotherapy, thermotherapy, chemotherapy, radiotherapy, and hydrotherapy, are distinct from other forms of treatment, which may not address the corporeal and noncorporeal parameters of human interiority. For mental health professionals such as psychologists and psychiatrists, art therapy often explicitly refers to psychotherapy or psychosocial treatment addressing psychosomatic ailments. The term therapy in “art therapy,” therefore, connotes unique attention to varied experiences related to the invisible human interiority (Selberg 2015; Thomas 2000; Slatman 2009) expressed in cross-cultural spirituality and psychosomatic experience of health and illness.

As an expressive resource for inner life experiences, art communicates transcendental, psychic, and subjective experiences of well-being. The use of art in illness diagnosis and therapy therefore underscores the subjective experience of the intertwining of morbidity and health with the body-mind-soul/spirit conceptualization of the human being. Art and its appreciation have therapeutic significance through its capacity to access and facilitate a person’s interiority, inner feelings, and inaccessible thoughts. Interiority is essentially the most private component of a person, which determines his or her personality, corporeal entity, and pursuits for health as optimum capacity to function. Art can stimulate aspects of interiority and subjective experiences that are relevant to understanding status of well-being, enhancing clinical diagnosis and therapeutic relationships between caregivers and patients, and healing through aesthetic affect and spiritual symbolism.

Body-Mind-Soul Well-Being in Art Therapy

Art therapy facilitates healing and general well-being through the psychic effect and elicitation which include incorporation of religious ritual in the healthcare processes. Positive health effects of art have been associated with artistic genres such as music, visual arts, movement-based creative expression, and expressive writing. While there is evidence that art-based interventions relieve adverse physiological and psychological disorders, clinical psychologists and biomedical researchers are yet to confirm how exactly this happens, the sustainability of the therapeutic outcome, and the extent to which art therapy enhances health. This is part of the mystery of most mechanisms of healing linked to spiritual and magico-religious interventions employing artistic symbolism and ritual in health interventions. The mystery of therapy mediated by engagement with creative arts is embedded in the conceptualization of holistic health. The World Health Organization (1978, p. 13) defined holistic health as viewing man in his totality within a wide ecological spectrum and emphasizing the view that ill health or disease is brought about by an imbalance, or disequilibrium, of man in his total ecological system and not only by the causative agent and pathogenic evolution.

Expressive art facilitates the goal of art therapy to address the need to restore and maintain psychosomatic balance. Art educes the imperceptible physiological and psychological or psychic experiences that affect health. The aesthetic power of art and holistic healing manifests in the lived experience of suffering, especially among chronically ill patients (c.f. Lane 2005). Engagement in creative art can therefore facilitate self-healing, which unfolds as both life-affirming and spiritually enriching in protracted illness and associated psychological imbalance trajectories (Zammit 2001, p. 270; Sholt and Gavron 2006). Participation in creative art during illness appeals both the psychosomatic aspects of health and the spiritual dimensions of existential meaning and security pursuits for the sufferer. Engagement with creative arts in this regard allows the meaning of

experience to become visible (Predeger 1996). This facilitates expression of emotions, concretization, and symbolization of the illness experience and catharsis.

Healing through art is part of contemporary medical initiatives in attempts to pay attention to emotional, physical, artistic, and spiritual dimensions of diagnosis and treatment. This complements biomedical interventions by focusing on the illness symptoms and the holistic nature of the person (Furnham and Forey 1994). Art therapy in this sense caters for the deeper therapeutic needs of the psyche and holistic care. Art contains the powerful images of the transpersonal encounter, which art media channels to express people's psychological needs (Jung 1983). Visual art and other art media are symbols of transformation that are personalized and concretized through individual engagement with them, in either spectator or creator roles. The methods and metaphors of art and its creation facilitate healing as they have the potential for spiritual and emotional transformation and catharsis (Sholt and Gavron 2006; Mareck 2001). In most traditional nonwestern cultures, art making is intrinsically spiritual and forms an important aspect of indigenous therapeutic systems. This complements the use of artifacts as transactional symbols to which people attach and transact their emotions for cathartic healing effect (Dow 1986; Jung 1983). This depicts emotional transference and transactions through visual and expressive art in religious ritual therapy. The affective aspects of art strengthen spirituality as an integral part of therapy and quests for wholeness.

Conclusion

Art therapy denotes a healthcare discipline and practice that draws on art to effect treatment. It involves art making by a patient in a clinical or treatment setting under the observation of a trained therapist. This includes the use of art to diagnose and treat a disorder. A second dimension of art therapy entails self-healing catalyzed by visual, expressive, and other forms of art media, not only within but also outside clinical settings.

The therapeutic processes draw on the capacity of art to access and facilitate expression of psychological interiority or inner feelings, thoughts, and states of mind. The processes and practice of art therapy connect the mind, body, and spiritual aspects in interventions for sustaining and restoring well-being. Art therapy therefore provides the much needed modality for enhancing a holistic approach toward maintaining and restoring health. The central feature of art therapy that makes it significant for coping with life course crises, including the experience of acute and chronic illnesses, is its capacity to express experience that is beyond verbal communication (Abraham 2005, p. 90). As a form of psychotherapy and counseling, art therapy has the potential to enhance personal growth, self-understanding, and emotional reparation, which are essential to preservation of holistic health.

Asabiyya, Concept of

Giovanni Patriarca and Diana M. Valentini
Rome, Italy

Political psychology demonstrates how historic turning points influence a community's perception of its own attitudes and serve as a catalyst for critical self-reflection and even transformation of the community's behaviors and *Weltanschauung*. In the context of an epochal geopolitical realignment – specifically, after the collapse of the Soviet Union – Arab socialist movements and secular identities languished and lost their power of attraction. Nascent forms of social engagements emerged, inspired by a newfound interest in religious traditions.

In this cultural framework, the rediscovery of Islamic philosophy and the desire to make it the focal point of study – especially the richness of the medieval tradition – play a key role in the self-understanding and social analysis of Islamic identity. The “Arab Spring” and its ensuing civil disruptions make this focalization even more compelling, as broken social bonds have triggered revolution, subversion, sedition, civil war, and divisions (*fitna*) inside the community. These social bonds are worthy of study and attention. According to Arab sources, *asabiyyah* (عصبية) can be defined as *public spirit, a group's cohesion, esprit de corps, or common will*.

In order to avoid the occurrence of civil upheaval, *asabiyyah* arises in Arab political communities as a kind of defensive wall, both strengthening the resolve of the intrinsic values of the inner community and protecting its members from the contamination of outside social

chaos. Rather than granting deference toward strains of egotism and excessive individualism, the common good of the community is viewed as paramount. The strong emphasis on a shared, mutual solidarity – in the interest of the entire society – serves as the sole and necessary condition for cooperation and public action. Silent mutual agreements (*asaba*) connect the individuals to a shared code of values in order to assure their survival. Such a unanimity in belief, ideas, and emotions fortifies the *Ummah* (Islamic community), by providing a common psychological and spiritual background and contributing to the formation of stable bonds of solidarity.

In the *Muqaddimah* (prolegomena to universal history), the philosopher Ibn Khaldun (Tunis 1332–Cairo 1402) gives a very detailed description of the concept of *asabiyyah*: a sense of common belonging binds each member of the community in a widespread effort toward a common aim. In his theory of social evolution and decline, the *level of asabiyyah* is strictly connected and directly proportional to the development, the acmes, and the deterioration of each civilization's historical parabola. Ibn Khaldun affirms that a dynasty that begins its history supported by the religion doubles the force of *asabiyyah* that helps it in its formation (Ibn Khaldun 1993, p. 325). It is a clear metapolitical perspective with strong eschatological implications.

According to the *Khaldunian cycle of generations*, the first generation of a civilization is characterized by a strong spiritual and ascetic union among the members. However, by the second and third generations, this religious spirit of unity grows weaker, as the political authority self-aggrandizes and enters into spheres beyond itself, secularizing the religious establishment as it does so. Individuals lose their standing as stakeholders in their own spiritual heritage and culture, and a superficial luxury substitutes for the ideals of sacrifice and sobriety. The fourth generation marks the denouement of social solidarity, as the “new ideals” generate more individualistic behaviors, which are accompanied by a series of ominous consequences.

Ascension

Jeffrey B. Pettis

Department of Theology, Fordham University,
New York, NY, USA

The ancient world understood the earth to be suspended within the larger *kosmos* consisting of various concentric realms. The whole order was perceived to be spiritually alive, its vastness creating anxiety among the ancients. Plato says that human beings existed as mere puppets having only a small portion of reality (Plato, *Laws* 804 B, 644 D–E). Marcus Aurelius wrote that the activities of humans are “smoke and nothingness” and the rewards of life vanish “like a passing bird” (M. Ant. 10.31; 6.15; 5.33; 10.10). This sense of alienation and the notion of the inferior nature of immediate existence created a desire to separate from the material world and ascend into the purer, celestial realm. Plato’s *Phaedrus* tells of the soul’s longing to spread its wings for upward flight to attain to god. In its fallen state it beholds beauty on earth making it desire the “true” beauty of the divine. It cannot attain this however, resulting in unending anguish (*parakinōn*, 249 D). In his *Contra Celsum*, Origen of Alexandria (185 CE–ca. 254 CE) refers to Celsus’ discussion of the seven stages or “gates” of the soul’s ascent associated with the ancient Mithras cult of Persia. The stages are like a ladder at the top of which is the golden gate of the sun and divine union. Each gate corresponds to one of the solar planets. The soul travels through each of the gates from the realm of the lower world to the higher realm of the gods (VI.22). The initiate looks directly into the rays of the sun to see a youthful deity, “beautiful in appearance, with fiery hair, in a white tunic and a scarlet cloak, wearing a fiery crown” (634–35). The ascension symbolizes the movement from the darkness of the unconscious realm into the light of consciousness. According to Jung, passage through the planetary spheres releases one to become free from characterological traits and compulsion specified in the

horoscope and of which one is born: “he has won the crown of victory and become a god” (Jung 1963: 230). Compare “The Angelic Liturgy” and the seven stages of angelic ascent to view the throne of God in the Dead Sea Scriptures (11 QShirshab). In a letter to the church in Corinth, Paul speaks of being “snatched away” (Greek, *harpagēta*) into the third heaven (2 Cor. 12.1–5; cf. the *Apocalypse of Paul* 3). The Old Testament pseudepigraphic writing 1 Enoch tells of the ascension of Enoch: “the winds were causing me to fly and rushing me high up into heaven. . . and I came into the tongues of fire” (14.8–9). Compare *Apocalypse of Abraham*, *Testament of Abraham*, *3 Baruch*, and *Ascension of Isaiah*. A consideration of ascension should also note its opposite, which is descending. Homer’s *Odyssey* speaks of the cave sacred to the nymphs that are called Naiads and the two doors, one toward the North Wind by which persons go down and the other toward the South going upward and is the “way of the immortals” (*athanaton hodos*) (XIII.104–114). Porphyry (232–305 CE), the disciple and editor of the Neoplatonist philosopher Plotinus, likens this cave to the grotto of Zoroaster in the mountains near Persia. Souls journeyed down into the generative potencies of the cave to be ascended into the way of immortality (Porphyry 1917, p. 2).

Asceticism

Fredrica R. Halligan
Mind Body Spirit Institute, Stamford, CT, USA

All the major world religions have recommended, at some point in their history, various practices of self-sacrifice in order to deepen and advance spiritual development. Asceticism is particularly pronounced in monastic orders. Ascetic practices vary from the passive (e.g., fasting, renouncement of desires) to the active (e.g., self-flagellation or, at the extreme, martyrdom). Most asceticism calls for moral choices and an austerity of lifestyle (the latter being quite counterculture in the USA today). In general, asceticism is intended to fulfill one or more of the following functions: control of appetites and sense pleasures, detachment from materialism and even from relationships, awareness of mortality and impermanence, gratitude for divine blessings, expiation for sins, and identification with the suffering of others (e.g., with the Passion and crucifixion of Christ).

In psychotherapy and spiritual direction today, the question to be addressed is the healthfulness of ascetic practices, or lack thereof. This discernment must explore the consequences on the reality plane as weighed against the spiritual benefit expected in the spiritual realm. Questions must include: Is the individual likely to be hurt now or in the future? Will others potentially be hurt? In the current days of awareness of terrorist mentality, the meaning and consequences of all acts of self-sacrifice must carefully be discerned. Also of

concern is the matter of motivation, along with the question of whether a specific act of self-surrender is life giving or essentially destructive. Ascetic practice can be very beneficial to the spiritual aspirant as long as the motivation and consequences are appropriate, not ego driven and not destructive to self or others.

Asexuality

Matthew A. Rider
Loyola University Maryland, Columbia,
MD, USA

In psychological and spiritual academic circles, there remains considerable disagreement over the term asexuality. Often the confusion involves whether one's behavior or identity distinguishes asexuality. Most definitions of asexuality have two dimensions in common – the absence of sexual orientation (asexual by orientation) and/or a pronounced lack of sexual interest or behavior (asexual by behavior). The first dimension involves people who are asexual by behavior such as celibates and virgins. These asexual by behavior individuals may or may not have low sex drive. This fact is especially true with those who have chosen to live an asexual lifestyle as part of a spiritual journey reporting an otherwise normal libido. Likewise, virginity alone is not a prerequisite for asexuality since many individuals who are asexual by behavior have engaged in sex in the past but have no current interest in or plans to engage in additional sexual behavior. Chaste

ordained clergy and vowed religious are overrepresented in this asexual by behavior group due to the nature of their vocation.

The second dimension of asexuality involves those who identify as having no discernible sexual orientation whatsoever (asexual by orientation). For these individuals sex is not a priority in their personal endeavors. This indiscernible sexual orientation can be difficult for some to understand since popular culture assumes that all human behavior is driven to some degree by the need for sexual gratification and/or reproduction. A common misperception is that individuals who are asexual by orientation share distaste for human intimacy and social bonding. Individuals with an asexual orientation are not necessarily isolationists; in fact, many of these individuals often report a strong desire for close, romantic relationships. Some individuals who are asexual by orientation engage in romantic relationships which could even be sexual at times; and while these relationships may be oriented to a specific gender, these relationships are not intentionally sexual in design. Partnered individuals who are asexual by orientation are invested in the romantic or companionship rewards of the relationship, not sexual gratification. Moreover, these asexual by orientation individuals who are involved in romantic relationships often need to negotiate sexual behavior as a condition of continuing the relationship with their partners. Despite agreeing to participate in sex in order to keep their relationships, these individuals claim they have no sexual orientation because the motivation for being in relationship is explicitly asexual in nature. Many of these asexual by orientation individuals in romantic relationships choose to de-emphasize the sexual nature of their relationships by defining the relations as either hetero-romantic or homo-romantic (as opposed to heterosexual or homosexual).

The temptation among outsiders to the asexual community is to find asexuality somehow aberrant – they must be hiding something or afraid to commit to a sexual orientation or maybe they were sexually abused at a young age in which case their asexuality is the product of trauma, not an inherent component of their

personality. These misplaced ideas about asexuality are rooted in ethnocentric ignorance. While the personal histories of some asexual individuals may contain trauma or internalized fear of labeling, this is not true for all persons who identify as asexual as is the case with clergy and vowed religious who chose an asexual lifestyle. Modern science has yet to determine a definitive causal factor for the spectrum of sexual orientations. Moreover, since a person's sexual behavior may not always be congruent with his or her sexual orientation, confusion about these two dimensions of asexuality – behavior and orientation – is understandable.

A separate dynamic related to asexuality has to do with the level of sexual distress that asexual individual experience. Sexual distress can be defined as anxiety related to sexual thoughts or behaviors. Sexual distress is often experienced by persons who have chosen an asexual lifestyle as a vocation, though this is not always the case. For celibates and ascetics, spiritual practices such as fasting, meditation, hard work, and prayer are thought to be critical in reducing one's sexual distress. Sexual distress among monastics has not yet been measured and leaves untested the assertion that strict spiritual practice in ascetic life reduces sexual distress. Individuals who are asexual by orientation engaging in romantic relationships also experience sexual distress relating to obligatory sexual behavior with their partners. Since the choice to abstain from sexual behavior for these individuals is not necessarily spiritual in nature, it is not clear if spiritual practices are an effective means of reducing their subjective levels of sexual distress. This is contrasted with non-religious individuals who are asexual by behavior in that these individuals report lower levels of sexual distress. These lower levels of sexual distress are likely related to the individual's sense of control over the decision to live an asexual lifestyle for purely personal reasons.

Asexuality is difficult to operationalize from outside the community. Researchers should use a broad definition in their research that includes but is not limited to an absence of sexual desire, a lack of sexual orientation, and intentional abstinence from sexual behavior. Research into human

sexuality has only recently begun the process of understanding the human inclination toward asexuality; much remains to be studied and understood. For those who are sexually abstinent for religious reasons, faith and spiritual practices are essential to channel one's sexual energies into spiritual development and a deeper connection with the Transcendent. Hence, spirituality can catalyze and nourish asexuality, yet spirituality and asexuality are not inextricably linked to each other. Given the variety of reasons for and expressions of asexuality and the complexity of an asexual orientation, asexuality as a lifestyle and an orientation remains fertile ground for psychological and spiritual research.

Ashtoreth

Lee W. Bailey

Department of Philosophy and Religion, Ithaca College, Ithaca, NY, USA

Ashtoreth was a goddess in the ancient Near East who appears several times in the Bible, with different versions of her name. Biblical texts spoke of the “Queen of Heaven,” perhaps referring to Ashtoreth, the only other major goddess mentioned. Ashtoreth is recorded in the Ras-Shamrah texts discovered in 1930–1933 in the land called Ugarit in biblical times, on the Mediterranean coastline, north of Israel, now in Syria. In one myth she is goddess of the sea and of fishermen and the wife of the god Baal. Fragmentary surviving texts say about her: “Homage to the Lady Asherah of [the Sea], Obeisance to the Progenitress of the Gods, (So) [she] will give a house to Baal like the [g]ods” (Pritchard 1958, p. 97). She is portrayed being a fertile source of life. Ashtoreth was related to similar goddesses of nearby cultures, such as Astarte of Phoenicia and Ishtar of Babylon, who also spread to other cultures.

When the Hebrews migrated into what is now Israel from about the eleventh century BCE, they mingled with existing cultures, mainly in Caanan and Phoenicia, and adopted their gods and goddesses. Ashtoreth was one of these, mentioned often in the Jewish Bible, the Tanakh. The ancient Israelites, like all cultures of the time, including Egypt where they had recently been, had polytheistic religious practices, believing that spirits filled the world and the deities assured health, good weather, food, children, and a good life. In a unique turn, the priests and prophets of Israel struggled for centuries against these other deities, to orient the Hebrews to Yahweh as the only god, the monotheistic Lord of Israel, who had been revealed to Moses. They were opposed to these other gods' practices, especially relating to fertility (Fig. 1).

Like many people around the world, people fervently believed that these gods and goddesses

Ashtoreth, Fig. 1 Alabaster, Paris, The Louvre Museum. From Necropolis of Hillah, near Babylon. Bronze Age to Classical times. Ancient Near Eastern Goddess of the divine power behind life systems, with various names in different cultures. Symbolized by the new moon. She was called Ishtar in Babylon, Astarte in Egypt and Phoenicia, Astarte and Ashtoreth in Israel. Her name is veiled in some translations of the Torah, since she was a pre-monotheistic goddess. (Source: <http://en.wikipedia.org/wiki/Ashtoreth>; <http://bibleencyclopedia.com/ashtoreth.htm>; Photographer Marie-Lan Nguyen (2006) Public Domain; http://en.wikipedia.org/wiki/File:Statuette_Goddess_Louvre_AO20127.jpg)

were necessary to the fertility of the earth, including farms, herds, and people. So people had a view of sexuality, as a natural part of the spirits of the world's reproductive systems. This had led to sexual practices that offended the Israelite priests and prophets, that they scorned as "sacred prostitution." So for centuries the struggle between Hebrew priests and prophets against the other religions continued.

Some Hebrew kings welcomed the neighboring popular gods and goddesses into the kingdom and built shrines and temples to them. Often the temple of Yahweh was also a temple to other gods

and goddesses, such as Ashtoreth. "Solomon followed Ashtoreth the goddess of the Phoenicians" (I Kings 11:5). Some Hebrew kings such as Ahab in the ninth century married believers in goddesses, such as Jezebel, who with Ahab promoted goddesses such as Ashtoreth. King Ahab... "took as his wife Jezebel daughter of King Ethbaal of the Phoenicians..." (I Kings 16:31). King Manasseh "bowed down to all the hosts of heaven and worshiped them. . . The sculptured image of Asherah that he made he placed in the House [of the Lord]" (II Kings 21:7).

Another factor in this struggle was that in developing monotheism, one gender choice had to be made for the one god, and that was male. So a male-dominated culture developed in Hebrew monotheism, and the women lost the direct access that they had to the divine through goddesses such as Ashtoreth. They did not want to let go of this divine channel of feminine power. When the prophet Jeremiah confronted those who worshiped "the Queen of Heaven," they protested:

Thereupon they answered Jeremiah – all the men who knew that their wives made offerings to other gods; all the women present, a large gathering; and all the people who lived in Pathros in the land of Egypt: We will not listen to you in the matter about which you spoke to us in the name of the Lord. On the contrary, we will do everything that we have vowed – to make offerings to the Queen of Heaven and to pour libations to her, as we used to do, we and our fathers, our kings and our officials in the towns of Judah and the streets of Jerusalem. For then we had plenty to eat, we were well-off, and suffered no misfortune. But ever since we stopped making offerings to the Queen of Heaven and pouring libations to her, we have lacked everything, and we have been consumed by the sword and by famine. And when we make offerings to the Queen of Heaven and pour libations to her, is it without our husbands' approval that we have made cakes in her likeness and poured libations to her? (Jeremiah 44:17–19).

But over the centuries, monotheism took root and the goddesses were suppressed. With this religion male authority grew, blessed by the one male Lord. So today the three monotheistic religions – Judaism, Christianity, and Islam – have supported patriarchal cultures. But now things have changed, as women have gained the rights

to education and birth control, and now in countries with the freedom of religion, the women's rights movement is exploring a revival of ancient goddess traditions of many kinds.

If we read carefully, the biblical account of Jacob, son of Isaac in Genesis 28, was a time of polygamy, when a man could have more than one wife. To avoid his marrying a Caananite girl, Jacob was sent by his father Isaac to marry a relative. He went east to Haran, now in Syria, to marry a cousin – a daughter of Laban, his mother's brother. Jacob met Rachel as she was watering her sheep, and he kissed her. When her father Laban met Jacob, he hugged his relative Jacob. To gain the hand of Rachel Jacob offered to serve him for seven years. But after the seven years, Laban sneaked Rachel's older sister Leah into the wedding bed in the dark, and they were united, for he wanted to marry his eldest daughter first. But since Jacob loved Rachel, they also made love, and married after another seven years, and had Joseph and Benjamin. This was not unusual, in the time of polygamy, for Jacob to marry two sisters, Leah and Rachel. He also had children with their maidservants Zilpah and Bildah. Jacob and Leah had eight children, including Levi and Dinah. He and Rachel had two: Joseph and Benjamin. With the maids Jacob fathered three more, including Dan. The early patriarchal societies were pretty relaxed about sexuality. (Yes, this is in the Bible, in Gen. 29–30)

Now what is left out here? In these early days before monotheism took hold, did these women worship a goddess? The biblical references to Ashtoreth and the Queen of Heaven say "yes." Anita Diamant explores what it might have been like. In her 1997 historical fiction *The Red Tent*, she proposes that the women had a red tent, away from men, where they went monthly for the "full moon." They talked with each other about what they could not say in public: gossip, the secrets of sex, dreams, stories like the beginning of the world, oracles, that their father Laban mistreated them like slaves, about how he had five wives, and almost gambled one, Ruti, into slavery (Diamant 1997, pp. 84–86), about miscarriages, childbirth (Diamant 1997, p. 62), the midwife's stories (Diamant 1997, p. 107), the pain of seeing some

babies die early, and about Jacob and his god El. They ate three-sided cakes, drank wine, cried, sang, and discussed the women's medicines like drinking fennel tea as a contraceptive (Diamant 1997, p. 65).

They did ceremonies for the girls who had their first blood: massaged her, applied henna, perfume, eye makeup, fed her cakes and wine, sang to her, conveying their pride in her new womanhood (Diamant 1997, p. 171), and did goddess rituals to ease her entry into lovemaking (Diamant 1997, pp. 172–73). They shared stories of the goddesses, such as the Babylonian Inanna who married Dumuzi, (Diamant 1997, p. 81), the holy tree where Zilpah made offerings to her little goddess statue, Nanshe (Diamant 1997, p. 89), and the sacred household gods, goddesses, the teraphim, and the Queen of Heaven (Diamant, 1997, p. 169). These are important psychological ceremonies for the women, and their goddesses symbolized the ultimate source of their womanhood. The archetypal image of the Queen of Heaven understood their needs, feelings, suffering, and pride. Being a red-blooded woman was not shameful and embarrassing in that Red Tent.

Today's women's powerful archetypal experiences expressed in Diamant's book have expanded in the documentary DVD "Things We Don't Talk About: Women's Stories From the Red Tent," directed by Isadora G. Leidenfrost (Leidenfrost 2012). The ancient goddess is granting her powers and gifts to women sharing in her archetypal experiences. Feminist psychology is gaining goddess stories and rituals for women to directly access the divine.

Asian American Pastoral Counseling

K. Samuel Lee
Practical Theology, Spiritual Care, and
Counseling, Claremont School of Theology and
Claremont Lincoln University, Claremont,
CA, USA

Asian Americans (the term "Asian Americans" does not include Native Hawaiians and other Pacific Islander groups) constitute 6% of the US population according to the 2010 Census, a 46% increase from 2000 to 2010. Asian Americans are the fastest-growing group of all racial groups including Latinos. With more than 30 ethnic subgroups and more than 40 spoken languages and dialects, Asian Americans are extremely diverse in population demographics, socioeconomic issues, and mental health needs. About 60% of Asian Americans are foreign-born and nearly

three out of four speak a language other than English at home. The six largest Asian American subgroups include Chinese (3.8 million), Filipino (3.4 million), Indian (3.2 million), Vietnamese (1.7 million), Korean (1.7 million), and Japanese (1.3 million) (Asian American Center for Advancing Justice 2011). Among ethnic groups, South Asian Americans are the fastest growing in the country.

Mental health issues among Asian Americans are complex and vary significantly based on factors such as immigration history, family separation, trauma experienced from war, immigration and employment status, and educational attainment. For example, Asian American youth in general consider suicide more often than their African American and White counterparts; Asian American women older than 65 years or older have the highest suicide rate. Many Southeast Asian groups such as Vietnamese, Cambodians, Lao, Hmong, and Mien have experienced war trauma or torture from political turmoil and have shown significantly higher incidents of post-traumatic stress disorder. Disparities in mental health care continue to be serious problems for Asian Americans in comparison to European Americans, including (1) limited access, (2) poor assessment and inadequate treatment, and (3) limited research (New Freedom Commission on Mental Health 2003; U.S. Department of Health and Human Services 2001). For these reasons, the President's New Freedom Commission on Mental Health concluded that the "current mental health system has neglected to incorporate, respect or understand the histories, traditions, beliefs, languages and value systems of [this] culturally diverse group" (2003, p. 49). Pastoral counselors can potentially make unique and significant contributions to improve Asian American mental health.

Limited Access to Mental Health Care

Both practical and cultural barriers contribute to limited access to mental health care for Asian Americans (Speller 2005). Practical barriers include a high rate of uninsurance: one in six

Asian Americans do not have health insurance; there are also significant ethnic group differences where approximately 30% of Koreans and 22% of Vietnamese are uninsured (National Asian American Pacific Islander Mental Health Association, n.d.). Uninsured persons are less likely to seek professional health care due to high cost and no support structure to help them find help. Also, there is a limited availability of culturally appropriate and bilingual mental health care providers. When these services are available, mostly in cities with high concentrations of Asian Americans, the care providers are limited in number and are overwhelmed by the demand for service. Manderscheid and Henderson (1998) estimated that 70 Asian American mental health care providers serve 100,000 Asian Americans, only one-half the number of mental health care providers in comparison to European Americans. Asian Americans at times lack awareness of mental health-related issues and of available in-language public resources, thus contributing to their underutilization of mental health care services. Further, because over 21% of Asian Americans are linguistically isolated, many of the available public resources offered are not useful because they are offered only in English.

Cultural barriers also prevent Asian Americans from seeking psychological and emotional help. East Asian conceptions of psychological illness substantially differ from Western conceptions. Many East Asian Americans have been significantly influenced by the worldviews of Confucianism, Taoism, and Buddhism (Hong and Domokos-Cheng Ham 2001). These worldviews emphasize “emotional self-control, humility, filial piety, family recognition through achievement, and the integration of the mind and body” (Speller 2005, p. 71; also see Sue and Sue 2008). Emotional or mental problems are viewed as resulting from personal weakness in discipline or will power. Receiving a formal DSM-IV-TR diagnosis therefore is interpreted as a serious threat to one’s personal and familial identity. Upon receiving a DSM-IV-TR diagnosis, the dropout rate from treatment significantly increases (Speller 2005). When addressing serious mental health symptoms, many Asian Americans resist taking

psychotropic medications because these medications are viewed as poison (Peng 2008). Asian Americans tend to somatize their psychological symptoms and would prefer to consult with physicians rather than psychiatrists or counselors. They may resort to culturally acceptable expression of their emotional distress as lacking Taoist chi and consult with indigenous forms of treatment such as herbal treatments or acupuncture. They may also spiritualize their emotional or psychological distress, seeking assistance from their religious leaders rather than mental health professionals. The social stigma attached to mental disorders contributes to delay in help-seeking, poor treatment outcome, premature termination of care, and withholding of family or community support for many Asian Americans.

Poor Assessment and Inadequate Treatment

With enormous diversity among Asian Americans, these groups also demonstrate diversity in expressing their mental distress, which can lead to misdiagnosis. Lopez (1989) identified two kinds of therapist diagnostic biases when working with ethnic minorities: overpathologizing bias and minimization bias. Diagnostic tools designed for the US “general” populace are also questioned for their efficacy or cultural relevancy when used with Asian Americans. Many of these tools are unavailable in Asian languages. Use of translators also raises serious questions for diagnostic validity. Therapists’ preformed perceptions about Asian Americans as “model minority” or “refugees,” for example, may prevent therapists from making an accurate diagnosis. Treating Asian Americans as a monolithic people can be gravely misleading in assessment and make it difficult to establish collaborative therapeutic alliances. Misdiagnosis leads to inadequate treatment and poor therapeutic outcome.

Sue and Sue (2008) point out that in working with ethnically diverse clients, therapists must equip themselves with three core competencies: (1) “therapist awareness of one’s own assumptions, values, and biases”; (2) “understanding the

worldview of culturally diverse clients”; and (3) “developing appropriate intervention strategies and techniques.” They highlight the following East Asian values or conceptions as significantly bearing upon the therapeutic work: collectivistic orientation, hierarchical relationships, parenting styles, emotionality, holistic view of mind and body, and academic and occupational values (Sue and Sue 2008). Sue and Sue (2008) also point out the importance of paying attention to immigrant family experience such as conflicts between parents and children due to differential levels of acculturation. Therapists should also pay attention to how many Asian Americans perceive therapy as a foreign and often highly threatening concept. Asian Americans generally prefer that therapists take an active and directive role in therapy. Structuring the therapy session and providing clear guidelines about the therapy process and interventions are likely to produce positive outcomes. Asian Americans tend to prefer solution-focused therapeutic approaches including cognitive-behavioral therapy (Chen and Davenport 2005).

Limited Research

The President’s New Freedom Commission on Mental Health (2003) emphasizes that the lack of research on ethnic minority mental health is a problem. A report issued by the Surgeon General (U.S. Department of Health and Human Services 2001) points out specific research-related issues on Asian American mental health. First, classifying Asian and Pacific Islander Americans as one racial/ethnic category has been damaging to the provision of appropriate resources for these diverse communities. Having done so, researchers know little about “the rates of mental illness, access to care, quality of care, and outcomes of treatment for different groups of Asian Americans”; furthermore, such political grouping obliterates a wide range of sociocultural, historical, and psychological differences that exist among Asian American groups “and constrains analyses of the interethnic differences in mental illness, help-seeking, and service use” (U.S. Department

of Health and Human Services 2001, p. 112). Second, Asian Americans aggregated appear to achieve educational, occupational, and economic success and show low rates of certain health problems. However, the aggregated data unhelpfully promote a “model minority” stereotype that is oftentimes promoted by mainstream journalists and policy makers to justify lack of resources specifically for Asian Americans. Third, insufficient research data are available on how Asian American symptom expressions relate to the DSM-IV-TR diagnostic categories. Examples include what DSM-IV-TR identifies as East Asian “culture-bound syndromes”: Chinese “neurasthenia” and Korean “hwabyung.” Finally, little research is available on Asian American acculturation, Asian American age-based mental health issues, suicide, refugee mental health, utilization of mental health services, and appropriateness and outcomes of mental health services.

Asian American Pastoral Counseling

Although the pastoral counseling movement has its origins with predominantly European American Protestant communities starting from the 1930s, pastoral counselors are uniquely positioned to serve Asian American mental health needs. Pastoral counseling is understood as “spiritually grounded and psychologically informed care, counseling, and psychotherapies” based on “holistic understanding of human life as spiritual, biological, psychological, social and cultural” (American Association of Pastoral Counselors 2010). Many East Asian Americans would more favorably accept this holistic view of human life than the Western clinical view of a split between the mind and body. Pastoral counselors can function much more flexibly than other therapists who may be bound by the third-party payment and accompanying requirements. Pastoral counselors can also provide pastoral care, if necessary, in collaboration with other clergy partners and can also address mental health-related issues.

Many pastoral counselors have already established collaborative partnerships with religious communities although they tend to be

Christian. They are likely to have greater access to religious communities, which many nonreligious therapists do not have or in which they feel restrained because guidelines for working in such settings are not well established for therapists. A psychoeducational approach to Asian Americans has been a preferred service modality. These religious communities readily provide venues and an audience for preventive work, a high priority for communities that lack professional therapists. In rare cases, a religious congregation can transform itself to directly serve those with severe mental health needs (e.g., see Religion & Ethics News-weekly Public Broadcasting Service, June 22, 2012). Pastoral counselors must prioritize working with religious leaders and educating them about critical Asian American mental health issues.

The challenges for pastoral counselors in working with Asian Americans include how pastoral counselors may reach out to non-Christian Asian Americans. According to a nationwide Pew Research Center (2012) survey, Asian Americans have contributed to the religious diversity in the US religious landscape during the past decades. Among Asian American adults, Christians are the largest religious group (42%); “the unaffiliated” are second (26%); Buddhists are third (14%); Hindus (10%), Muslims (4%), Sikhs (1%), and other religions (2%) followed thereafter. Such a challenge also exists within Christian communities. Asian American Christians tend to be conservative and evangelical (e.g., Rah 2009) while pastoral counselors tend to be much more liberal in theological outlook. These theological differences may impinge upon the therapy outcome and process in significant ways. The therapist and client may experience conflicts over such issues including the importance of human agency versus the authority of the Bible, the role and the status of women, the importance of individuation versus family obligations, homophobia, and same-sex marriage.

The American Association of Pastoral Counselors (AAPC) provides important frameworks to address communities of color in their *Statements on Anti-Racist Multicultural Competencies* (American Association of Pastoral Counselors 2010a).

According to AAPC, pastoral counselors are to commit to carry out “clinical practice that is intentionally inclusive” and to hear the pains of those “who have been historically, intentionally, and systematically excluded and disadvantaged.” Pastoral counselors are to see themselves as soul healers whose essential function includes pursuing “social justice and democratic ideals in which all persons are regarded as having equal worth regardless of identity markers, including but not limited to race, gender, age, sexual orientation, difference in ability, religion, language, and cultural or national origins.” They additionally affirm the commitment to “appreciate human diversity as a gift, not a barrier, and engage in the practice and training of pastoral counseling in order to serve peoples from diverse backgrounds by acquiring the attitudes, knowledge, and skills needed for competent clinical practice.” These frameworks may also be used as a foundation to build upon in addressing the diverse mental health needs among Asian American groups who have been neglected in research and care.

Astrology

Rod Blackhirst

Philosophy and Religious Studies, La Trobe University, Bendigo, VIC, Australia

Along with alchemy, astrology is one of the cornerstones of the traditional cosmological sciences. In a popular sense the word astrology refers to the study of the influence of stars, planets, and other heavenly bodies upon terrestrial events. The belief that celestial bodies influence or control events upon earth, including the inner life of human beings, is exceedingly ancient and is found in virtually all civilizations and cultures. It is more accurate, though, to understand astrology as an extensive symbolic language that permeates traditional cosmological thought far beyond the question of stellar “influences” upon earthly life. Traditional cosmology tends to understand the earth and sky as a single integrated system or even as a single living organism, in which case the planets are the “organs” of the cosmos. There are Western (Hermetic), Indian (Vedic), and Chinese systems of astrology, among others.

While astrology was often regarded as a priestly and divine science in ancient times, it has tended to be marginalized in the perspectives of the monotheist faiths because it is perceived to compromise the absolute nature of the Divine Will. These faiths have been keen to insist that the planets are not gods and that the predetermination of events is subject to Divine Will and not the outcome of mechanical cosmological forces. In the Middle Ages many Churchmen, including Popes, were practicing astrologers, but in more recent centuries (especially since the Reformation), astrology has tended to be cast as an “occult” science – or even one of the “black arts” – and so antithetical to orthodox religious faith.

In ancient texts astrology is inseparable from meteorology and weather prediction but it is also linked with character analysis and the determination of human temperaments. The notion that

mental disease is caused by or is associated with the configurations of stars and planets is also age-old and has left its mark in modern languages in terms such as “lunatic” (one driven mad by the moon).

Belief in astrology persists in modern times in spite of the scientific revolution and the fact that the entire premise of astrology as it is usually formulated – nonphysical and subtle or spiritual causal forces – violates the most basic tenets of the scientific paradigm. In fact, it is arguable that belief in astrology has never been so widespread and popular as it is today. Countless people “follow their stars” in astrological columns in magazines and newspapers, and there is a vast industry of astrologers offering consultations and “readings” to paying clients.

Much of this takes the age-old form of soothsaying and prognostication – the prediction of coming events – but in the modern context, much of it may take a more diagnostic form with the astrologer offering psychological and character analysis from the study of a horoscope (natal chart) drawn up for the client’s time and place of birth. Since the nineteenth century, there has been a strong movement to resituate astrological theory and practice away from the traditional methods of deterministic prognostication (called horary astrology) toward an understanding of astrology as a type of ancient and occult psychology with a corresponding emphasis upon natal astrology (the astrology of individual’s births).

The most important proponent of this shift was Carl Jung who argued that astrology and alchemy were premodern forms of the psychological sciences and who was even known to consult horoscopes (nativities or natal charts) of his patients in the belief that this could reveal aspects of their personality and especially their unconscious motivations. Jung (1962) said that “astrology represents the summation of the psychological knowledge of antiquity”, and regarding its use in clinical practice added “I must say that I very often found that the astrological data elucidated certain points which I otherwise would have been unable to understand” (Jung 1948).

Jung attempted to provide a scientific basis for the use of astrology in psychology by advancing

the theory of synchronicity which he styled as an “acausal connection principle” and more generally in his theory of the collective unconscious. According to Jung and the many astrologers who have followed him, the planets and stars (Zodiac) represent universal principles reflected in aspects of human psychological makeup. There is thus a *correspondence* between the heavens and the structure and contents of the human psyche. For example, it is supposed that planets that are situated below the horizon at the time of birth (and so are in the lower half of a horoscope) represent forces and motivations of which the native (patient) is not usually conscious. If, for instance, the planet Mars (traditionally the planet of the war god) is below the horizon and in a position considered to be “afflicted” or detrimental, then the native may be subject to violent and unpredictable rages over which he/she has little control. It is then supposed that knowledge of one’s horoscope can provide self-insight and offer solutions to psychological problems.

Jung regarded the horoscope as an adjunct to more conventional modes of psychological analysis and a useful tool for therapists. The development and systemization of this basic proposal has been pursued by many astrologer/psychologists since Jung, most notably by Dane Rudhyar who adapted aspects of the so-called humanistic school psychology (Carl Rogers, Rollo May et al.) to astrology. For him, the horoscope (natal chart) is a map to be used for the exploration of the complex inner world of drives and functions that together constitute the complete psychological organism. The publication of Rudhyar’s *The Astrology of Personality* in Rudhyar (1936) was a milestone in psychological astrology. Carl Rogers published his *Client-Centred Therapy* in 1951. In the 1970s Rudhyar extrapolated Rogers’ ideas to what he style as a “transpersonal astrology.” His *Person-Centred Astrology* was published in Rudhyar (1972). In this work he redefines astrology as a language of symbols to be deployed as a diagnostic tool in the quest for psychological wholeness, integration, actualization, and personal fulfillment.

These ideas were further developed by such astrologers as Marc Edmund Jones, Robert

Hand, Michael Meyer, and Richard Idemon and have done much to change the face of contemporary astrology. In the United States today, there is an Association for Psychological Astrology directed by Glenn Perry and staffed by men and women who are both practicing astrologers and qualified psychologists. The organization offers master's and doctoral degree programs.

The enthusiasm of psychological professionals and therapists for astrological tools, however, has waned since the 1970s – astrology has been psychologized far more than psychology has been astrologized – and one cannot really speak of a legitimate conjunction of the two disciplines. Despite its popularity astrology is still regarded as a fringe or pseudoscience, while psychology, especially in the last 30 years, has sought fuller legitimation as an empirical, mainstream science and has been eager to shed its associations with quackery. Astrologers have tried to legitimize astrology (as “astrotherapy”) by presenting it as akin to or as an adjunct to the psychological sciences, but it cannot be said the association has been endorsed in kind by most psychological professionals.

Astrology and Alchemy

Claudia Bader

Institute for Expressive Analysis, New York, NY, USA

Alchemy and astrology are complementary disciplines. Sister sciences seen as the precursors to chemistry and astronomy, respectively, their practitioners also consider them arts. They posit a universe where consciousness and matter are one. Alchemy relied upon astrology; astrology does not need to incorporate alchemy.

Astrology is the older discipline; some of the oldest written astrological references are Mesopotamian and go back to approximately 1800 BCE (Britton and Walker 1996, p. 42). It is an interpretive art as well as a science. The science of astrology is the observation and charting of the sky. The configuration of the planets is an objective fact based on geometric calculations, set up for the day, minute, and location of a person's birth. The universal element, the sky on a given day, is made personal through connecting it to earth through the time and location. This creates the wheel of the 12 houses of astrology, which determines exactly how the sky on a given day will manifest for whatever question is asked. This can be related to many different things: a person, business, country, or question.

Astrological work is most importantly the interpretation of the meaning of the configurations charted. The study of astrology involves memorizing the different archetypal meanings of the different elements of astrology: planets, signs, houses, and aspects (the geometric relationships between the planets). The art of astrology is in the synthesis and interpretation of these in relation to the subject at hand. The stars and planets have set orders and sequences. The meanings of the signs and planets have been consistent for thousands of years in western and eastern (Jyotish/Vedic) astrology. One conceptualization of astrology is that it shows how we internalize and individualize the greater whole of life symbolized by the planets and signs. However it is conceptualized, it is about

an external, orderly, a priori process made internal.

Alchemy is the inverse. In alchemy, the order has to be pulled from within the process. Alchemy is mysterious in that there is no order that is observable from the outside; even deciding what substance is chosen to begin the transformation is cloaked. Practitioners had to experiment to find this out; work with dream and revelation was just as important as scientific experiments in guiding the alchemist.

Alchemy is about process and transformation. The physical work in alchemy literally involves transforming substances from one thing to another. The goal is to obtain a substance that has the ability to transform: the philosopher's stone. However, the journey to obtain this is a transformative journey in itself, effecting psychological and spiritual change. The central metaphor of alchemy, the transmutation of lead into gold, is a metaphor for the refinement of one's being.

The planets and signs hold great archetypal significance for alchemists. In terms of correspondences, each planet has a metal associated with it; in alchemical formulation, the metals from the planets are spun from the cosmos into the earth. Alchemists used astrology to time their alchemical work, determining when to initiate a process. This allowed the alchemist the maximum alignment with the energies he/she sought to transform. These are the correspondences of the planets and the metals:

- Sun: gold
- Moon: silver
- Mercury: mercury
- Venus: copper
- Mars: iron
- Jupiter: tin
- Saturn: lead

In addition to the above, the seven basic alchemical stages defined by Edward Edinger in *Anatomy of the Psyche* have correlations to astrological archetypes.

The stages Edinger chose are Calcinato, Coagulatio, Solutio, Sublimatio, Mortificatio, Separatio, and Coniunctio.

Although alchemy is no longer in the forefront of modern consciousness, the archetypal power of the imagery and themes resonates psychologically as Jung and many Jungians have explicated. However, the connection between astrology and alchemy is still alive, and the maxim of "As Above, So Below" can be observed in contemporary times by studying astrology, as well as in dream imagery, and themes and experiences of individuals.

People who have certain astrological themes highlighted in their charts natively or in a particular stage of their life will have characteristics and/or experiences correlating with the qualities of alchemical stages.

The astrological correlates along with the physical definition of the alchemical stages, examples of imagery, and psychological themes are as follows:

- *Calcinato – Mars, Pluto, Fire*
 - *Chemical Process:* The intense heating of a solid to remove water and all other constituents that will volatilize. What remains is a fine, dry powder.
 - *Images:* Fire, Burning, Hell, Purgatory, Wolf, Lion.
 - *Psychological Themes:* Desire, Passion, Power, Attachment, Envy, Anger, Integrity.
- *Coagulatio – Earth, Saturn, Moon*
 - *Chemical Process:* The turning of vapor or liquid into a solid state. Cooling, or evaporating, or a chemical reaction which can create a new compound.
 - *Images:* Body, Eating, Crucifixion, the Fall, Incarnation, The World of the Senses, Sex, Clothes (The body is the clothing for the soul).
 - *Psychological Themes:* Embodiment, Object Constancy, Dealing with Reality, Containment, Limitation, Time and Space.
- *Solutio – Water, Neptune, Moon*
 - *Chemical Process:* A solid is turned into a liquid.
 - *Images:* Water, Ouroboros, Swimming, Baptism, Bath, Flood, Dew.

- *Psychological Themes*: Compassion, Fusion, Idealization, Dependency, Addiction, Selflessness.
- *Sublimatio – Mercury, Jupiter, Uranus, Air*
 - *Chemical Process*: The material is turned into air by volatilizing and elevating it. The solid, when heated, passes directly into a gaseous state and ascends to the top of the vessel, where it resolidifies on the upper, cooler region.
 - *Images*: Flight, Heights, Towers, Radio Stations, Jacob's Ladder, Cosmic Ladder, Angels, Birds.
 - *Psychological Themes*: Detachment, Objectivity, Dissociation, Grandiosity, Observing Ego.
- *Mortificatio – Pluto, Saturn, Mars*
 - *Chemical Process*: None.
 - *Images*: Blackness, Feces, Rotting, Smells, Mutilation, Overflowing Toilets, Worms, Pollution, Resurrection, Rebirth, Growth, The Nigredo. The blackness is brought about by the slaying of something, usually the dragon, but often the king, the Sun, or a lion.
 - *Psychological Themes*: Mourning, Loss, Ego Death, Depression, Hatred. The death and transformation of the ruling principle within.
- *Separatio – Saturn, Uranus, Mars, Libra*
 - *Chemical Process*: The prima materia is thought of as a confused composite of contrary substances that require separating out. The substance when heated will separate out into a volatile part which vaporizes and one which coagulates. A composite is separated out into orderly parts.
 - *Images*: Swords, Knives, Logos, Compasses, Measurement, Numbering, Weights, Divisions.
 - *Psychological Themes*: Separation/Individuation, Discrimination, Discernment, Schizoid States, Splitting.
- *Coniunctio – Sun, Venus, Whole Chart, Saturn in Libra*
 - *Chemical Process*: Two substances come together to create a third with different properties. In particular, molten metals and the

formation of amalgams by the union of mercury with other metals.

- *Images*: Marriage, Sexual Intercourse between the Sun and Moon, Love.
- *Psychological Themes*: Integration of the self into a whole, Individuation, Maturation.

Astrology and Mandalas

Claudia Bader

Institute for Expressive Analysis, New York,
NY, USA

“Mandala” is the Sanskrit word for circle. The basic structure of a mandala is extremely simple. It is a circle. The circle encloses a sacred space, thought to include both the circumference and the center. When you see it on a page, it creates an inner and an outer space. It starts to become elaborate when it is concentric, or when a quadrated form is placed in or through it, as seen in Fig. 1. This sacred circle is found everywhere, in the sun, the moon, a flower, a face, an eye, and so on. The mandala with a cross shape in it is a classic form. The combination of quadration with the circle establishes a relationship of opposites. The four directions of the cross fix the endless movement of the circle, which has no beginning or end. It is a symbol for the eternal whole, which transcends time and space. From this foundation, it is elaborated upon in multitudes of ways, creating meditative devices the world over.

Astrology and Mandalas, Fig. 1 A mandala with quadrations. (Artist: Patricia M. Bowers)

The cycles of life – day and night and the regular returns of the seasons – define the circular motif in our viscera. Juxtapose this with the linear experience of time and aging or the quadrated experience of the equinoxes and the solstices – and the circle with a cross – becomes imbedded in our very bones.

An astrological chart is a mandala.

Its foundation structure is a circle with a cross. Two axes, horizontal and vertical, anchor the chart; then two more axes are drawn, creating the full astrological wheel of 12-pie-shaped houses (Figs. 2 and 3).

To understand the significance of the cross within the wheel, note the horizontal line in the chart. It is symbolic of the horizon line. This is where the rising sign, or the ascendant, determined from the day, minute, and location of someone's birth, is placed. The sign on the ascendant is the section of the sky containing the constellation coming up over the horizon at the day, minute, and place of someone's birth.

It organizes the signs on the wheel, which are placed on each axis called a house cusp, in a counterclockwise direction. The astrological houses rule different areas of experience and also

Astrology and Mandalas, Fig. 2 The basic structure of an astrology chart, the wheel of the houses

Astrology and Mandalas,**Fig. 3** Complete astrology chart with the planets placed into the wheel of the 12 houses

represent different dimensions of the psyche. The basic meanings and archetypes of the houses are given below.

The Houses:

1. Self-Projection, Body, Beginnings: The Divine Spark/Divine Child
2. Self-Worth, Personal Resources, The Body as First Possession, Finances: Conservationist
3. Near Environment, Information, Conceptualizing a Self: Siblings
4. Roots, Home Life, Parenting: The Tribe, The Source
5. Romantic Love, Self-Expression, Pleasure: The Lover/Artist
6. Daily Life, Physical Health, Work: The Servant
7. Marriage, Other People, Partnerships, Open Enemies: Marriage
8. Sex, Death, Transformation, Shared Resources: Initiation
9. Larger Horizons, Life Philosophy, Knowledge: The Priest and Priestess
10. Life Task, Profession, Parents: The Culmination
11. Life Wishes, Group Affiliations, Friendships: The Community/Idealist
12. Life Transcendence, Psychological Health, Sense of the Eternal, Self-Undoing: The Monk, Mystic, Prisoner

The planets are then placed in the wheel of the houses, and where they are placed is determined by the sign on the axes, which are called house cusps.

This determines how the sky of the day will affect someone personally.

This is important because the sky is universal, not individual; everyone born on a particular day will have the same placements of the planets in the sky (Sun in the sign of Pisces, Moon in Cancer, Venus in Aries, etc.). This is organized

Astrology and Mandalas, Fig. 4 The progression of the angles

through the circle of the zodiac in the sky that hugs the ecliptic. This is the circle of the astrological mandala. The ascendant fixes the universal energy in time and space, literally bringing it down to earth. This is the cross of the astrological mandala.

This has a counterclockwise order.

In addition, there is a clockwise order as well in the chart, also beginning at the ascendant. Moving in a clockwise direction, it is the beginning of the cycle of a life, dawn. The next turning point represents the noon of life and is at the top of the chart. The third angle, exactly opposite the ascendant, represents sunset. The final angle, at the bottom of the chart, represents the midnight of life, the end of the matter as well as the root issues in life (Fig. 4).

Thus, the astrological chart is a graphic image of how we come from one source, as symbolized by the circle, becoming individualized through time and space.

In this way we inhabit a mandala of existence on earth, and to study an astrology chart is to contemplate a mandala.

Psychological Aspects

Mandalas and the astrology chart share archetypes of self, center, and reconciliation of the opposites. Jung stated that the mandala is the archetype of wholeness, relating it to the Self. Mandala images arise spontaneously in dreams and art as symbols of the center of the self.

In addition, the wheel of the zodiac and the circle of the mandala create symbolic holding environments, which hearken back to the experience of lying in the circle of one's mother's arms.

Thus, the core architecture of the mandala, and the astrological chart, evokes this early preverbal experience.

Astrology and the Transitional Object

Claudia Bader

Institute for Expressive Analysis, New York,
NY, USA

In discussing transitional phenomena, Winnicott states,

this is the place I have set out to examine, the separation that is not a separation. . . but a form of union (1974, pp. 97–98).

An astrological chart is created from the date, minute, and place someone takes their first breath. It creates a map which describes how an individual expresses a piece of the cosmos, similar to the idea of a fractal. Astrology is a symbolic language, and someone's chart is a symbolic bridge. In addition to being a symbolic language about the self that becomes internalized, it is also a concrete image drawn on a piece of paper.

A person's chart shows how he or she is both separate and individual, yet one with the universe. In this way, an astrological chart is literally a transitional space, and the chart itself a transitional object.

To look at these ideas, I'm going to list the qualities of the transitional object and explore how these dynamics are reflected in people who are cathected to astrology. The bolded sentences are direct quotes from Winnicott in his book *Playing and Reality*.

These are the qualities that define the transitional object, as quoted from Winnicott in *Playing and Reality*.

Qualities of the Transitional Object

1. *The infant assumes rights over the object, and it is agreed upon by all.*

The charts are their charts, real and meaningful. It is an objective fact anyone can agree upon, based on personal birth data.

2. *It stands for the breast, or the object of first relationship.*

The chart works as a surrogate mother in that it holds an image of the person for them; it is drawn in a circle, which is a containing space and conceptually provides a container which facilitates the ability to hold one's self. The astrology chart represents the first relationship, which is to the ultimate container, the cosmos, the ultimate "Great Mother." The round chart itself is a circle with a center, a breast/mandala/eye image.

The eye image adds a layer of symbolism related to lying in mother's arms looking into her eyes. Seeing and being seen, this crucial early experience begins the emotional life. Looking into her eyes, we see ourselves reflected there through her responses to us and her love. We are mirrored by her.

It has a breast energy in that the chart feeds with information and provides mirroring. It is demand feeding, totally under the control of the subject, since it can be pulled out and looked at it whenever it is desired. However, it is not always a "good" breast – sometimes it is positive feeding when it presents "good aspects" and sometimes it is negative feeding or a "bad" breast when seen in terms of "bad aspects."

3. *It antedates established reality testing.*

The chart is set with the first breath, before there is any ability to test reality.

4. *It is a possession.*

The astrology chart is our unique and special object. It is both an internal mental construct and an external object that can be possessed, the chart drawn on a piece of paper.

5. *It is not internal nor external. It comes from without from our point of view, but not so from the baby's point of view. Neither does it come from within; it is not a hallucination.*

The chart is based on something wholly without – the planets at the time and place of birth. It is where a person connects to the objective universe. Yet it is also within us as a completely subjective reality – an expression

of someone's life and life's meaning, as well as a developmental timing device. The predictable cycles of the planets reflect universal life developments as well as reflecting individual differences within the universe. Therefore, a chart is within and without.

It is not a hallucination because it is based on the hard facts of the planets' places and movements.

6. *The object is affectionately cuddled and excitedly loved as well as mutilated. It must never change, unless changed by the infant. It must survive instinctual loving, hating, and pure aggression if need be.*

A person's chart is a drawn image on a piece of paper. This piece of paper is often carried around, looked at, poured over. It is played with in the sense of doing calculations on it. It often falls apart, but can be redrawn. On a more superficial level of astrological information, people read their horoscopes in newspapers; but the columns and their information are excitedly read. Either the actual chart or the newspaper columns can be rejected, hated, and put away if the individual chooses. They never change, in that the natal chart is fixed, and one's sign never changes. They survive.

7. *It must seem to have a warmth, or to move, or to have texture or to do something that seems to show it has avitality or reality of its own.*

The chart is filled with life. It comes from and represents the living universe. It moves on its own in that it reflects time and changes the timing techniques in astrology, called transits and progressions.

8. *The infant passes from omnipotent control to manipulation. It may develop into a fetish object persist into the adult sexual life. It may stand for feces. It is created by the child.*

A popular astrological theory is that the chart is "chosen" before someone was born or reincarnated. In this sense, they have created it. It is their life path, an indicator of who they are, and what energies we are using. The chart may be seen as having an omnipotent power to help control life by showing what will happen. This gives the user an illusion of

control. Of course, as one continues studying and/or experiencing astrology, it becomes clear that it is not omnipotent that perfect knowledge of the future is not obtainable although one can be forewarned of some aspects of it. By studying one's self through astrology, learning to work with (manipulate) the chart and its symbols, there is a sense of gaining mastery over ourselves and our lives.

9. *Its fate is to be gradually decathected. It is not forgotten, but it loses meaning.*

Chart interpretation is a synthesizing of the meanings of all the symbols in their positive and negative modes. The ability to see good and bad at the same time is a developmental achievement. However, the root of symbolic meaning in astrology is beyond both good and bad. The ultimate object of the study is to know life and reality so well that the chart is not needed to mediate one's life and thus can eventually be discarded. In therapy, I notice that often the chart is initially a very important topic of discussion and interest, but as the therapy progresses it is talked about less and less until eventually it is referred to only during times of stress.

Atman

Fredrica R. Halligan

Mind Body Spirit Institute, Stamford, CT, USA

In Hindu thought, *Atman* is the true Self of each individual, which is at one with the Divine, Brahman, the Absolute. C. G. Jung acknowledges indebtedness to this concept in *Aion* where he refers to the “*Atmic* self.” The Hindu concept differs from Jung, however, in that the *Atman* is one and the same in every person. *Atman* is *Brahman* since, as it is said in India, “That thou art.” Thus, God is the Indweller of every soul. The life task of each person is to discover *Atman* within.

In the *Upanishads*, ancient scriptures of India, *Atman* is described as the innermost nature of every living being, pure and unchanged. Neither birth nor death nor rebirth can alter *Atman*. It is the Real, the unchangeable. In contrast, the body, mind, and personality are changeable and are therefore defined as unreal, or illusory. This usage of the words Real (unchangeable) and unreal (changeable) often creates confusion in the minds of Westerners who use the same words differently. Whether Hindus chant, “Lead me from the unreal to the Real,” or talk of *Moksha* (liberation), God-realization or Self-realization, the meaning is the same, i.e., discovery of the eternal *Atman* within. This is the essential spiritual yearning, dating back to ancient Vedic times and continuing today.

The concept of *Atman* or Higher Self is not without controversy, however. In India the topic has long been debated, with Buddhists taking the contrasting view, which they call Emptiness, no-self or *Sunyata*. Some spiritual pundits (e.g., Jungian analyst, Hawyo Kawai) believe that, at the ultimate experience, both paths end up at the same place, i.e., that paradoxically Emptiness and Fullness of Self are essentially the same experience. What is clear is that both Hindu and Buddhist meditative traditions teach that mind and ego must be transcended in order to achieve the ultimate state of Realization (*Moksha* or *Nirvana*, respectively).

Wilber’s Synthesis

In Western psychology, Ken Wilber conceptualized a spiritual-developmental path that he dubbed, “The Atman Project.” In Wilber’s perspective, the pathway to realization of *Atman* initially follows an outward arc towards development of ego, followed at midlife and beyond by an inward arc where ego is renounced and desires are transcended in order to approach the ultimate unity, with consciousness resting only in God, i.e., the *Atman*. Wilber synthesizes psychological, Hindu, and Buddhist practice when he states that the ultimate goal, whether called God, *Atman*, Buddha, or Ultimate Reality, is accompanied by recognition that “all things and events in the Universe are aspects of one fundamental Whole, the very source and suchness which is the Real itself” (Wilber 1980, p. 101).

Traditional Hindu Pathways

In ancient India, Patanjali was the renowned pundit who charted the journey in search of *Atman*. Patanjali’s *Yoga Sutras* call for devotion to God as the means toward liberation or Self-realization. Spiritual practice and deep psychological purification are needed. The mind must be stilled and freed from all desires. What bubbles up, advanced meditators proclaim, is a state of absorption in *Atman*, nothing else. The experience has been described metaphorically as a light that does not flicker in a windless place. Thus, one-pointed meditation is recommended as an important *sadhana* (spiritual practice). This transcendent state of liberation is considered to be beyond the Western mapping of psychological states.

In the *Bhagavad Gita*, the central scripture of Hinduism, the realization of *Atman* is described as union or merging with God, a state that is free from all worldly attachments, free also from ignorance, greed, and pride. To discover the infinite Self, the *Atman*, the Divine within, there is a gradual shift from the small self (or ego) to the higher state of consciousness. This shift is toward

ever-more subtle states of awareness. In the process a detached observer arises, sometimes called the Watcher. Some say that this observer is the *Atman*. Others say that eventually even the Watcher disappears.

Hindus believe that the Self underlying the personality is perfect but is covered by layers of illusion. *Atman* lies beyond the senses, beyond the emotions, beyond the intellect. Realization of one's true identity (*Atman*) requires letting go of ego and all that has previously been thought of as "I-me-mine."

Atonement

Ruth Williams

Association of Jungian Analysts, London, UK

The concept of atonement is closely associated with forgiveness, reconciliation, sorrow, remorse, repentance, reparation, and guilt. It is a spiritual

concept which has been studied since time immemorial in Biblical and Kabbalistic texts.

It is in a linked pair (or Syzygy) with forgiveness.

It is also associated with the Christian idea of confession and repentance which requires atonement.

Atonement is an archetypal idea and as such originates in an archetype (which Jung describes as "an irrepresentable, unconscious, pre-existent form that seems to be part of the inherited structure of the psyche and can therefore manifest itself spontaneously anywhere, at any time" (Jung 1958–1964, par. 847).

To atone is an act of conscience. True atonement must come from the ego since it must need a conscious humbling rather than moral superego flagellation from "on high" ("Ego" is used here in the Freudian sense, whereas from a Jungian perspective, true atonement would be an expression of Self).

Some regard the process of psychotherapy itself to be a transformative process of repentance in as much as the very act of entering into psychotherapy has a dynamic effect on all those closely connected with the patient himself or herself. There is usually a process of reflection, on past acts, as part of the path of individuation (a Jungian term for the unfolding process of becoming more fully oneself which is broadly the goal of a Jungian analysis). Achieving this requires a person to follow what is known in Kabbalah as the path of the Zaddik (the path of honesty/integrity) which ultimately leads to "at-one-ment" in the sense of a oneness with God which may be seen as the potential inherent in the genuine process of atoning. This accounts for the immanence, the numinous quality associated with the sense of completion achieved in fully embracing atonement.

The ability to atone is connected to one's ego strength. If the site of the betrayal or "sin" is one which is suffused with narcissistic wounding, shame or hubris can inhibit the ability to atone. It therefore takes great sensitivity – both in collective and in personal situations – to enter into such a process.

In Judaism the "book of life" is considered to be open until the end of Yom Kippur (Day of

Atonement). The book of life is seen as containing one's fate (contingent on the process of atonement undergone during this period) for the next year, and the book is sealed at the end of the Yom Kippur festival. In organizations such as Tikkun (a modern/progressive Jewish community whose name means to heal, repair, and transform the world), the imagery of Yom Kippur has been turned into a spiritual path: they take a 10-day period over the festival to examine what changes are needed in life and how seriously one will take the yearlong process of making those changes. By condensing the period of heightened attention to 10 days, they are making sure that there is a time when these matters are brought to the forefront of one's conscious awareness. If one has not been able to make any progress in self-awareness and steps toward change in those 10 days, then in a certain sense one's fate is considered to be sealed, the idea being that we will continue to receive the karmic consequences of being the way that we are at the current moment and to the extent that we want that to change, this 10-day period becomes a spiritual retreat and intensive short-term "psychotherapy."

Yom Kippur is the most sacred day of the year in the Jewish calendar which is marked by fasting, abstaining from work, sex, washing, and wearing of perfume and leather shoes (much like the Christian period of Lent). To truly engage with such a process has a transformative effect, although, as with all religious dogma, it can simply be treated as a ritualistic act.

The idea of the scapegoat originates with the rituals performed during the Yom Kippur festival. In ancient times the high priest of the Temple in Jerusalem would conduct a sacrificial ceremony on Yom Kippur. He would be clothed in white linen and would confess his own sins and then the sins of the people of Israel before making a blood of sacrifice. The priest then ejected a goat from the temple with a scarlet piece of woolen cloth on its head. It was goaded and driven, either to death or into the wilderness, which was seen metaphorically as carrying away the sins of Israel. It was believed that if these sins were forgiven, the scarlet cloth would turn white.

Some regard the Old Testament scapegoat as being a prefigurement of the New Testament

Christ whose suffering and death similarly expunged man's sins. William Holman Hunt inscribed the following two Biblical quotes on the frame of his painting "The Scapegoat": "Surely he hath borne our Grievs, and carried our Sorrows/Yet we did esteem him stricken, smitten of GOD, and afflicted" (Isaiah LIII, 4), and "And the Goat shall bear upon him all their iniquities unto a Land not inhabited" (Leviticus XVI, 22).

In the absence of atonement, *someone* becomes scapegoated and left carrying the Shadow.

Sylvia Brinton Perera explores the etymology in *The Scapegoat Complex*: "The Hebrew word for atonement, *kipper*, is related to *kippurim*, eliminatory procedures. . . . A Babylonian rite on the 5th day of the 10 day New Year festival was called *kippuru* and involved purgation, purification, confession of sins and a human sacrifice" (1986, p. 11).

Some of the elements in the complex – e.g., guilt and reparation – have been explored by Melanie Klein (1937) in a model which looks back to infant anxiety and the early development of conscience.

Cook draws our attention to the African philosophy of *ubuntu* which emphasizes the connection between the individual and the collective which perhaps facilitated the balancing of understanding and reparation rather than going down the path of vengeance and retaliation.

Desmond Tutu (1999) (Commission Chair) writes about the principles of restorative justice which underlay the Truth and Reconciliation Commission, being rooted in the African concept of *ubuntu* which is akin to atonement. *Ubuntu* emphasizes the relatedness between humans whereby everyone is diminished when someone is dehumanized. Criminality is seen as a breach in relationship which is restored by healing the breach as opposed to punishment per se (see Tutu 2004, pp. 4–5; concept also described in detail in Tutu 1999, pp. 34–36).

The acts of atonement and forgiveness are seen as linked, the process involved being partially located in the realm of what Jung described as the psychoid unconscious, so that failure to atone produces a scapegoat. This perspective highlights how energetically we are tied to each other: one person's failure to act can have a significant

impact on the ability of the other party in such a dyad to forgive. It is in this impasse that situations can seem quite intransigent and incapable of change. (Might it be in this impasse that blame is more likely to arise?).

This failure to take responsibility by the wounding party thus creating a scapegoat would be seen in terms of the Shadow being projected on to the “other.”

Attachment and Loss

Jeanne Stevenson-Moessner

Practical Theology, Perkins School of Theology, Southern Methodist University, Dallas, TX, USA

Children’s hunger for mother-love and presence is as great as children’s hunger for food (Bowlby 1969, p. xiii). This position was maintained by John Bowlby and his colleagues, particularly James Robertson and later Mary Salter Ainsworth. This premise undergirded their compelling work on instinctive behavior and the ontogeny of human attachment.

Bowlby and his associates focused on disturbances and separations in the early relationships between young children and their primary care-takers, most often mothers or mother-surrogates. Whereas psychoanalytic theory at that time connected psychopathology more with child fantasy and the internal events or process of the child, Bowlby and his associates connected psychoneurosis and other forms of emotional disturbance in the child primarily with rather external events. Bowlby undertook training at the British Psychoanalytic Institute and received supervision from Melanie Klein. In her reconstruction of attachment theory, Inge Bretherton relays crucial insight into Bowlby’s disagreement with Klein’s approach: “Klein held that children’s emotional problems are almost entirely due to fantasies generated from internal conflict between aggressive and libidinal drives, rather than to events in the external world” (Bretherton 1992, p. 761). Klein would not allow Bowlby to speak to the mother of a 3-year-old in treatment. Bowlby’s view which had been formed in part through his earlier work at the London Child Guidance Clinic was to look into family process as a cause, if not the cause, of early emotional disturbance (Bretherton 1992, p. 761).

In 1948, James Robertson and Bowlby received a small grant to investigate the effects of mother-separation on the development of small

children. Robertson, in particular, worked with 2- and 3-year-old children who were separated from their mothers for weeks or months and placed in hospital or residential nurseries without a stable mother-substitute. Robertson was “deeply impressed by the intensity of the distress and misery he was witness to whilst the children were away from home” and even after they returned (Bowlby 1969, p. xii)! Intense clinging or rejection of and detachment from the mother were observable reactions. According to Bowlby, these reactions will be active in older adults who are still suffering from their early separations, maternal loss, and disturbances. These adults are described as clinging and insatiable in their demands (as in dependent or hysterical personalities) or detached and blocked in forming deep relationships (as in affectionless and psychopathic personalities).

In 1950, the World Health Organization (WHO) under the guidance of Ronald Hargreaves asked Bowlby to research the mental health of homeless children. In the wake of World War II, many children were homeless and/or orphaned. Bowlby then had occasion to interact with leading child psychiatrists, psychologists, and other specialists in the field. In his resulting report of 1951, he formulated the essential principle of mental health: “the infant and young child should experience a warm, intimate, and continuous relationship with [her] mother (or permanent mother-substitute)...” (Bowlby 1951).

A film produced by the Tavistock Child Development Research Unit in London and orchestrated by James Robertson with Bowlby’s guidance made a visual impact that was not to be forgotten. Titled “A Two-Year-Old Goes to Hospital,” the film illustrated the impact of maternal deprivation on an isolated 2-year-old girl (1952).

“Separation anxiety” became the focus of the second volume: *Attachment and Loss*, Vol. II: *Separation* (1973). Various related phenomena such as the distress of separation and the anxiety which follows are discussed at length in this second volume. Behavior with and without

mother includes naturalistic observations of humans and nonhuman primates. Bowlby began to utilize ethology for helpful concepts in his exploration of situations that arouse fear. The assessment of danger, susceptibility to fear, and cultural clues learned from others led Bowlby to two breaks in tradition, especially with the psychoanalytic. First, objects that frighten us often bear only an *indirect* relationship to what is in fact dangerous. Secondly, “We are frightened not only by the *presence*, or expected presence, of situations of certain sorts, but by the absence, or expected *absence*, of situations of other sorts” (italics by Bowlby 1973, p. 78). In traditional psychoanalytic and psychiatric circles, the assumption was held that proper fear is always in the presence of something or someone likely to damage us. The second assumption held by traditional psychoanalysts was that a response of fear to something or someone unlikely to hurt us is abnormal. Bowlby took issue with both assumptions. He saw separation anxiety over a beloved object as allied to fear and as a normal response.

The third and final volume of *Attachment and Loss* (Bowlby, The Tavistock Institute of Human Relations 1980) continues to explore “the implications for the psychology and psychopathology of personality in the ways in which young children respond to a temporary or permanent loss of mother-figure” (p. 1). Whereas in the first two volumes, Bowlby drew heavily from ethology and control theory, in Volume III, he utilized cognitive psychology and human information processing. In outlining the trauma of loss, Bowlby clarified the defensive processes. The mourning of children and adults is lodged under the rubric of attachment theory.

Bowlby’s contributions were made more applicable and accessible by the related work of Mary Salter Ainsworth. Ainsworth expanded Bowlby’s clinical studies through her laboratory procedure titled “The Strange Situation” experiment, through her Baltimore Project involving 26 families, and with her culture-sensitive work in Uganda.

Surely there is more to be done with cultural awareness, economic factors, and gender inclusivity. The latter would benefit from the increasing studies in father absence and father attachment.

Psychology and religion are mutual beneficiaries of John Bowlby's legacy. Religious studies could investigate the relationship between maternal and paternal figures and God images. How does maternal and paternal deprivation create other hunger. Religion promotes a self-in-relation; that significant relation goes by different names including the Divine, the Wholly Other, the Higher Power, and God. Bowlby demonstrated in his trilogy that a child is born as a self-in-relation. Religion and psychology can take this to ever new levels of understanding.

Attention

Bernardo Manzoni Palmeirim

School of Arts and Humanities, Department of English Studies, University of Lisbon, Lisbon, Portugal

Introduction: Psychology and Religion as Pursuits of Wisdom

When psychology was constituted as an experimental science, during the nineteenth century, it became formally disconnected from philosophy and religious studies. Yet, traditionally – and recalling that “psychology” (*psycho-logia*) etymologically means “the study of the soul” – these fields of study gravitated around the broad concept of “spirituality.” In ancient philosophy, wisdom was sought through practical exercises intended to cure our false perceptions of the world. Epicureans and Stoics, for example, performed a series of attentional exercises, which they regarded as forms of healing the soul: “First and foremost, philosophy presented itself as a therapeutic, intended to cure mankind’s anguish” (Hadot, p. 265). Psychology shares this goal of curing ailments of the *psyche*. Religion, through prayer and other uses of attention, tries to cleanse the soul of the disordered or diseased perception it calls “sin.” Attention lies at the hub of these wisdom traditions and techniques of psychic therapy, given its intimate relation to attributes as essential to human self-understanding as perception and awareness.

Attention in Modern and Contemporary Psychology

William James, one of the founders of modern psychology, provided a landmark definition of attention which begins as follows:

Everyone knows what attention is. It is the taking possession by the mind, in clear and vivid form, of one out of what seem several simultaneously possible objects or trains of thought. Focalization, concentration, of consciousness are of its essence (p. 256).

The opening sentence, however, expresses a conundrum that, to an extent, still underlies attention – a concept that is subjectively obvious enough in ordinary language (“Pay attention!”), but that remains, to this day, objectively elusive. In other words, attention is something we all engage in but is hard to define, since it depends on terms (such as James’s use of “consciousness” above) that are just as indefinable. Thus, as modern psychology developed during the end of the nineteenth century, attention was the metaphysically sounding concept that everyone knew, from experience, had to exist, but scientists were unsure how to approach in practice.

The inherent vagueness of the term was partly why behaviorism soon shunned research on internal mental processes (including attention), although they did emphasize the need to measure objective reactions to external stimuli. This preoccupation with the material mechanisms and conditions that account for the effective processing of stimuli and data characterizes much of the interest of cognitive and neuropsychological research to this day. Some concerns include how, and using which brain areas, we: integrate features such as color, size, and orientation; use visual or auditory, or even cross-modal attention; switch between tasks; manage our capacity for attentional focus; resort to memory in relation to attention; etc.

Between the 1950s and 1960s, research mostly focused on *selection* and the “single-channel” processing theory, according to which we generally pay attention to one thing at a time (James’s focalization). Given that we are continually bombarded by a countless number of stimuli, selection is the necessary perceptual reduction (a *bottleneck*) that guarantees focalization. Attention filters our sense-influx so that we may coherently perceive and comprehend the world. Selection was integral to cognitive psychology, where human understanding was understood in analogy to computer processing, inspired in the information technologies that began after WWII and boomed in Western societies as of the 1970s.

From the 1970s to early 1980s, cognitive science studied *focused* versus *divided*

(attending to more than one thing simultaneously, albeit with less concentration, i.e., multitasking), and *controlled* and *sustained* (e.g., radar monitoring) versus *automatic* attention: all varieties of attention James had already identified. From the mid-1980s to the present, cognitive neuroscience and neuropsychology have been able to extend these lines of inquiry using new technological resources (PET and fMRI), further uncovering, quantifying, and mapping the neural mechanisms and pathways underlying attentional brain activity. Advancing on James’s fundamental insights, which continue to provide an operational framework, different types of attention have been studied and categorized, including “focused, selective, directed, divided, sustained, effortful, controlled, automatic, and voluntary attention” (Cohen, p. 4). These varieties show that attention is best understood as an umbrella term for a system that includes a network of organically overlapping processes.

Studies: Attention Versus Distraction

The ever-growing impact of technology on our everyday lives and the pressure to handle increasing amounts of information has led to an interest not only in attentional processes but also in understanding and treating diseases and disorders affecting attentional capacity, e.g., dementia and Alzheimer’s, traumas to specific areas of the brain, multiple sclerosis, and ADD (Attention-Deficit Disorder). ADD preoccupies scientists and parents alike, since it impairs the learning development of otherwise intelligent children that exhibit difficulties in effectively accomplishing cognitive tasks.

James had also described how an inability to attend may impair learning: “[Attention] implies withdrawal from some things in order to deal effectively with others, and is a condition which has a real opposite in the confused, dazed, scatterbrained state which in French is called *distraction*” (p. 256). In short, *distraction* signals an inability to *control* and *direct* attention: a “sensitivity to immediately exciting sensorial stimuli

characterizes the attention of childhood and youth” (p. 263).

The *reactive* state of distraction is characterized by an *automatic* attraction to stimuli (e.g., being drawn to street noises while trying to complete homework) – and has a notable bearing on religious discipline. Just as for James there is a distinction between the automatic attention of the child/student and that of the adult/teacher, ordinary attention is different from the higher, controlled attention of spiritual discipline, which, to develop, requires training and study (rites and exercises), and the guidance of spiritual instructors. The name commonly given to these sets of practices, which in various ways envisage the attainment of a more enlightened awareness of the self, is meditation.

Spiritual Discipline

Disciples of meditation train shutting down the automatic reactions of the *ordinary mind*, which is viewed as the producer of constant, and spiritually deflective, chatter: in other words, distractions. When we follow the ordinary mind’s chatter (from worrying about to-do lists to more deep-seated anxieties and wishes), we are essentially *passive* subjects. In short, “ordinary attention comes and goes without consent: it is not something we *do*, but something that *happens* to us” (Novak, p. 8). The aim of meditation is that we cease to be a passive to become an active agent of attention, by learning how to control and eliminate our “automatic, egocentric, habit-determined patterns of thought” (Novak, p. 11).

Meditation requires great mental effort because attention must be sustained for increasing periods of time. The first realization is that we simply cannot maintain it: distractions are too ingrained and powerful, and we are quickly swept away in this habitual torrent of associations. Yet this failure holds a valuable lesson, since it evidences “the distinction between consciousness as such and the contents of consciousness. Objectification of the contents of consciousness and disidentification with them are natural outcomes” (Novak, p. 11). In other words, the disciple should

experientially learn the difference (by repeatedly attempting and failing to sustain the attention of a quiet mind) between awareness and the manifestations that occur within that perceptual space.

Varieties of Spiritual Exercises

Although meditation has a common root in the ancient Eastern philosophies that began in India, namely, Buddhism and Hinduism, it is (like attention) an umbrella term, covering a wide spectrum of attentional practices. Moreover, different religions share different meditational elements in their traditions and rituals. Within this large family, we may identify two broad families of meditation that originated in Buddhism: “mindfulness” (*vipassana*) and “one-pointed” (*samantha*).

Mindfulness

Practitioners of mindfulness train “pure awareness.” They still their minds, silently observing everything that passes through the field of consciousness. Thought and judgment are suspended, in a disciplined pursuit of spiritual detachment (i.e., freedom through ego-lessness). The aim is to find attitudinal disengagement from the attachments our egos have falsely come to believe as valuable and necessary, through a vigilant and progressive ceasing of automated reactions. Mindfulness has been of interest to some psychologists, who help patients cure or alleviate disorders such as stress and depression by learning to observe and objectively distance themselves from destructive thought patterns. Depth psychology, in the tradition of Freud and Jung, embraces mindfulness as a technique for uncovering information rooted in the unconscious. Most spiritual traditions, however, maintain that the self should disidentify itself with manifestations of the unconscious (“distractions”), seeking objective detachment as a direct mode of therapy instead.

“One-pointed” Meditation and Prayer

While in many aspects similar to mindfulness (notably in its use of sustained attention), “one-pointed” meditation is, in contrast, a focalized activity. Prayer, too, is of the “one-pointed”

variety and is a useful example given that, as a ritualized act of attention, it incorporates prescribed objects, such as icons or sacred texts. These objects serve as mediums for attention, which is *intentionally directed* at a supreme concept or Being, in an attempt to establish the self in a direct relationship with this sacred dimension, deity, or God. In religions where moral judgments are integral, prayer is framed as a therapeutic or preventive measure against what is viewed as the false attitudinal attachments of sin and temptation.

We may distinguish two subspecies of “one-pointed” meditation, depending on whether the focus is foremost external or internal, respectively: *concentration* and *contemplation*.

Concentration

Concentration typically utilizes external and symbolic aids or rituals (physical, bodily and discursive) to facilitate the focalization of attention: e.g., recitation of mantras (Tantric, the Jesus Prayer); bodily postures and breath (Taoism and yoga); religious images, icons, and mandalas; elaborate sequences and instructions (*The Spiritual Exercises* of Catholic St. Ignatius of Loyola, or the ecstatic Kabbalah of Jewish mystic Abraham Abulafia).

There is a parallel between concentrative meditation and cataphatic prayer, which is based on discursive affirmation. In this tradition of prayer, God is positively described – albeit through metaphor: in words, images, pictures, or sounds. In sum, linguistic elements are used to help the mind concentrate on the sacred. Attentional aids may also overlap. In the “Jesus prayer,” for example, it is important to coordinate “the breathing with the words . . . The usual practice is to inhale on the words ‘Lord Jesus Christ, Son of God,’ and to exhale on ‘Have mercy on me’” (Goodwin, p. 90). Sufi and Gregorian chants can mix elements (music, posture or ritualized movements, breath and words) to concentrate attention.

Contemplation

In mystical traditions, meditation is often structured as a progression from concentration to contemplation (e.g., the four steps of the *lectio divina*), whereby the cataphatic or “positive”

elements (of language, description, and interpretation) are a preparation for the silent waiting that forms apophatic prayer. For Christian mystics, such as St. John of the Cross, union with God is to be sought through the *via negativa* of non-discursive apophatic prayer. Since God, by definition, cannot be “known” (rationally conceived), contemplative prayer should not be made up of words but a whole-hearted immersion in God’s mystery (as also instructed in, for example, the anonymous *Cloud of Unknowing*). Simone Weil, a Christian mystic philosopher, defined contemplation as attention itself: “Absolutely unmixed attention is prayer” (p. 117). In contemplative prayer, the believer sustains an attending attitude of love and longing that is directed at God, and patiently and humbly waits for the love of God to pierce through. Although contemplation bears many similitudes with mindfulness and its silent and enduring pursuit of enlightenment, the latter need not be intentionally directed, through faith, at an ontological being.

Conclusion

The universal goal of wisdom, shared by ancient philosophy, psychology, and religion alike, is that man be cured of false beliefs and attachments. Attention, in the tradition of spiritual discipline, is a trainable faculty that may empower human development in the search for meaningfulness and happiness, through more awareness and a spiritually healthy existence. The study and practice of attention has everything to gain from bridging the quantitative and qualitative, objective and subjective, findings of psychology and religion, two fields of knowledge that stem from common pursuits.

Augustine

Nathan Carlin
McGovern Center for Humanities and Ethics,
University of Texas Medical School, Houston,
TX, USA

Life and Legacy

St. Augustine of Hippo (354–430) was born to a pagan father and a Christian mother. After a rather wild adolescence, he began to work out his own intellectual and religious beliefs by means of trying on a number of ideas: to name a few, he was highly influenced by various strands of Platonism; he wrestled with Manichaeism and skepticism; and, finally, he embraced Christianity. As Augustine noted in his *Confessions* – the first western religious autobiography – his heart was restless until it found rest in God. St. Ambrose baptized Augustine in the year 387, and Augustine later organized a monastery that eventually became established in Hippo, where he was made bishop in 396.

While he impacted the Western Church much more than the Eastern Church, Augustine, for better or for worse, is undisputedly one of the most influential theologians of all time. With regard to the history of doctrine, he is perhaps most well known for his ideas about original sin and just war theory, as well as for his views on the Donatist and Pelagian controversies. He also greatly influenced John Calvin, perhaps the greatest mind of the Protestant Reformation.

On Psychology

While Augustine was doing theology, he also addressed psychology. In *On the Trinity*, for example, he made a case for the rationality of the idea of the Trinity – how, in other words, one could rationally conceive of God as “three-in-one” – on the grounds that human personality (one) consists of being, knowing, and willing (three). As Diogenes Allen (1985) points out, “Augustine used the human mind as his analogue because human beings are created in God’s image” (p. 103). In human beings, then, Augustine looked for “trinities” to learn something about the Trinity (1985, p. 103).

On Sexuality and the Body

Augustine wrote about human sexuality as well (cf. Brown 1988). In *The Literal Meaning of Genesis*, Augustine notes that some interpreters of Genesis 3 regarded the first sin to be intercourse. One might say that these interpreters made proto-psychoanalytic interpretations centuries before Freud when they argued that the tree in the garden represented a penis and that the true or deeper meaning of the story concerns premature, premarital, and irrational sex (cf. Wulff 1997, pp. 293–297). Augustine, however, takes the text at face value and sees the sin simply as disobedience to the Lord’s commands (cf. Kvam et al. 1999). In any case, Augustine still does not have a positive view of sexual intercourse – far from it – even if he does not see the first sin to be of a sexual nature. Sexual intercourse as human beings

experience it now, Augustine argues, gives evidence for the “fall.” Augustine holds that, before the “fall,” human beings could have procreated without passion and as a deliberate act of the will, but now, Augustine laments, sexual arousal is not governed by the will. So the first sin, if not sexual, nevertheless had serious consequences for human sexuality. Another point to add here is that, for Augustine, the original sin of Adam and Eve is passed down by means of procreation – that is, by means of sexual intercourse. And because all human beings after Adam and Eve (except the Virgin Mary and Jesus) have come into the world by means of sexual intercourse, all human beings, following Augustine’s logic, bear the consequences of the sins of Adam and Eve (cf. Pagels 1988).

Since Augustine was so influential in the history of doctrine, his views on human sexuality have naturally affected many strands of Christianity and western culture in general. In cotemporary scholarship, Daniel Boyarin has written extensively and eloquently on the cultural effects of Augustine’s views. In his *Carnal Israel: Reading Sex in Talmudic Culture*, Boyarin (1993) notes Augustine’s infamous charge against “the Jews” – namely, that they are people of the flesh. Ironically, Boyarin, himself a Jew, says that “Augustine knew what he was talking about” (p. 1). But conceding to Augustine this point enables Boyarin to turn what was once a criticism of Jews into a criticism of Christianity and other dualistic metaphysics. How? Boyarin argues that, “for rabbinic Jews, the human being was defined as a body – animated, to be sure, by a soul – while for Hellenistic Jews (such as Philo) and . . . Christians (such as Paul), the essence of a human being is a soul housed in a body” (1993, p. 5). The importance of this perhaps subtle difference in theological anthropology is that

The notion that the physical is just a sign or a shadow of that which is really real allows for a disavowal of sexuality and procreation, of the importance of filiation and genealogy, and of the concrete, historical sense of scripture, of, indeed, historical memory itself. The emphasis, on the other hand, on the body as the very site of

human significance allows for no such devaluations (1993, p. 6).

In *The Body and Society*, Peter Brown (1988), generally regarded as the leading scholar on Augustine, has written about such issues as well.

The Psychological Study of Augustine

In the field of psychology of religion, there has been considerable interest in Augustine. William Parsons (2003) marks the beginning of the modern psychoanalytic study of Augustine with an article by Charles Kligerman (1957) and a symposium in *The Journal for the Scientific Study of Religion* during the years 1965–1966. Two decades later, Parsons notes, followed another symposium in the journal that led to an edited volume by James Dittes and Donald Capps (1990). Capps and Dittes (1990) mark the beginning of the modern psychological study of Augustine with William James, who characterized Augustine as a “divided self” (p. vii). They note that, while the psychological publications on Augustine “are scattered among journals and books of several academic disciplines and the writers reflect diverse professional and scholarly orientations, the psychological study of Augustine is a matured field” (1990, p. vii). And so the purpose of the Capps and Dittes volume is “to recognize that field of study, to give it a sense of identity and to demonstrate its accumulated wisdom, to introduce fresh interest and to open new vistas” (1990, p. vii). Since then, the most recent full-length psychoanalytic study of Augustine is by Sandra Dixon (1999); James O’Donnell’s (2005) work is noteworthy as well. By reviewing the works cited here and the works cited in these bibliographies – especially the publications by Parsons (2003) and Capps and Dittes (1990) – the reader will have a good sense of the psychological studies of Augustine to date.

In “Psychoanalysis and Mysticism: The Case of St. Augustine,” Parsons (2003) sketches a portrait of what he thinks a contemporary (and future) adequate psychoanalytic interpretation of Augustine would entail. Parsons notes that, in the psychoanalytic theorizing of Augustine, one can

observe three types or schools of interpretation – namely, classic, adaptive, and transformational. Parsons (1999) previously suggested these categories for understanding the psychoanalytic study of mysticism, and in this article, he peruses the psychoanalytic literature around Augustine with his own categories in mind. How does Parsons define the three categories? By “classic” he means traditional or orthodox (and therefore usually oedipal and reductive) psychoanalytic interpretations of mystical experiences. Here, a mystical experience is usually explained in terms of developmental conflicts, and sometimes such experiences are rendered pathological and, therefore, pejoratively (cf. Kligerman 1957). “Adaptive” interpretations do not interpret mystical experiences to be pathological. Quite the contrary, here mystical experiences are understood often to lead to growth. With regard to Augustine’s mysticism, Parsons notes that Dixon (1999) argues “for a preoedipal basis for Augustine’s mysticism when she states that the ascent with Monica to the ‘region of inexhaustible richness’” which is, for Dixon, “the inexhaustible breast” (Parsons 2003, p. 159). Parsons thinks that this argument is representative of an “adaptive” reading, as is Philip Woollcott’s (1966) argument that “the mystical visions were complicit in enabling Augustine to cure himself” (Parsons 2003, p. 158). “Transformational” interpretations go even further and break with classic and adaptive interpretations in that transformational interpretations give epistemological legitimacy to the mystic, even while acknowledging the validity of classic and adaptive interpretations. As Parsons puts this with regard to the psychoanalytic study of Augustine, “a transformational approach must also create metapsychological space for a mystical desire which ‘ascends’ beyond the purely developmental” (2003, p. 169). The transformational approach, then, seeks a dialogical approach to religion and psychology.

Donald Capps (2007a, b) has continued to write on Augustine, and two of his recent articles have appeared in *Pastoral Psychology*. In “Augustine’s *Confessions*: The Story of a Divided Self and the Process of Its Unification,” Capps

(2007a) notes that, when he began his professional career over 30 years ago, he wrote an article “on the psychologies of religion identified with Sigmund Freud and William James” (p. 551). Capps says that he did not realize then that he “would be engaged in a sort of dialectical embrace of these two innovative thinkers throughout [his] career” (2007a, p. 551). So, in the first article, Capps (2007a) uses, as his subtitle intimates, James’s notion of the divided self to interpret Augustine’s *Confessions*, and, in the second article, Capps (2007b) focuses on Freudian interpretations of the *Confessions*, specifically on the often-noted issue of self-reproach in the *Confessions*. All of this is to point out, in other words, that the psychological study of, and engagement with, Augustine is alive and well (see also Bingaman 2012; Hampson and Hoff 2010; Lamborn 2011).

Authoritarian Personality

Daniel Burston

Department of Psychology, Duquesne University,
Pittsburgh, PA, USA

Authority and the Father

The “authoritarian personality” is a social psychological construct derived from early psychoanalytic theories of attachment to (and conflict with) the father. To begin with, note that Freud's own attitude toward paternal authority was profoundly ambiguous. In 1910, Freud attributed Leonardo da Vinci's astonishing precocity to the fact that he

had “escaped being intimidated by his father in earliest childhood,” implying that the routine exercise of paternal authority leads to the suppression of free and unfettered intellectual development in children and, later on, in adults. Without saying so in so many words, Freud's tribute to Leonardo suggested that childhood and adolescent rebellion against paternal authority is essentially an *emancipatory* process.

However, 3 years later, in *Totem and Taboo*, Freud linked rebellion against paternal authority to an intractable ambivalence rooted in our phylogenetic inheritance, which presumably underlies the “collective obsessional neurosis” that underscores all religious ideation. On this second reading, rebellion against paternal authority is an unconscious reenactment of a collective rebellion against a prehistoric tyrant – in short, a repetition compulsion. Freud never reconciled these contradictory views of rebellion against paternal authority or even acknowledged their existence in his work (Burston 1994, p. 214).

Freud attracted many followers who resonated with the antiauthoritarian elements in his thought. However, all those who were radical or uncompromising in their opposition to patriarchal authority were eventually thrown out of the International Psychoanalytic Association, e.g., Otto Gross (in 1909), Wilhelm Reich (in 1933), and Erich Fromm (in 1954).

Though greeted as a theorist of great promise in 1907, Otto Gross was a “wild analyst” disowned by Freud and Jung by 1909 (Burston). Before his dismissal from “respectable” psychoanalytic circles, Gross was immersed in the matriarchal theory of J. J. Bachofen (Michaels 1983; Green 1999). In 1916, Gross inveighed, both publicly and in print, against “the patriarchal-authoritarian character” – an idea taken up by Wilhelm Reich a decade later (Cathier 1971, Chaps. 9 and 10) in his efforts to explain the growing appeal of Nazism.

Unlike most of his colleagues on the Left, Reich was alert to the quasi-religious character of the Nazi movement and explained the religious and mystical dimensions of Nazi thought and propaganda as sublimated expressions of sado-masochistic tendencies in the collective psyche.

Fascism and Sadomasochism

When it is used to describe a sexual perversion, the word “sadomasochism” denotes a kind of emotional numbness, or an inability to experience full sexual arousal and release without inflicting pain on others, or having pain inflicted on oneself. But this narrow definition of sadomasochism was abandoned or, more accurately, expanded by Freud and his followers in the 1920s. Freud noted, for example, that sadism and masochism seldom appear in pure form and that sadistic and masochistic tendencies are always found together in the same person. As a result, a person who prefers the sadistic role harbors masochistic tendencies, because a great deal of the pleasure derived from sadism derives from a process of unconscious identification with their victim. Conversely, the masochist identifies with the sadist and derives pleasure from this in the midst of his pain. (This explains why sadomasochists often exchange roles.)

Taking his cue from Freud, Reich said that our definition of sadomasochism should be expanded beyond overt sexual behavior to include sadistic and masochistic *character traits*, which may or may not take on sexual form. People with a predominantly sadistic character may not gravitate to S & M per se but take great pleasure in dominating, defiling, and humiliating other people, robbing of their dignity and their powers of autonomous decision and action. They love power and control. Hitler was clearly such a person. He was not interested in sex, really, but loved power, control, and killing people, as did most members of his inner circle. Masochistic characters, by contrast, take pleasure in submission. They feel anxious unless they are neurotically attached to a more powerful person who tells them what to do. They love power and control too but typically seek it out in others, rather than trying to seize it for themselves. Many of Hitler’s followers fit the masochistic profile. They silenced their consciences and their critical faculties and obeyed their Fuehrer, regardless of how heinous and bizarre his ideas and behavior were.

According to another analyst, Erich Fromm, neither the sadist nor the masochist – in this

diffuse, characterological sense – is capable of genuine love or compassion for other human beings. Instead, they cultivate a kind of sordid intimacy with others – what he called “symbiotic attachment.” According to Fromm, people with a pronounced and open preference for sadomasochistic sex are relatively rare and often conflicted about their inclinations, because they are frowned upon by the general population. But sadistic and masochistic *character traits* are quite prevalent in the general population, and when they proliferate beyond a certain point, authoritarian and antidemocratic regimes tend to flourish. In such circumstances, people who are relatively normal in terms of their sexual behavior and daily habits, but whose conscience has atrophied, support leaders whose sanity is quite precarious. The more grandiose and inflated a sadistic leader’s ego becomes, the more his followers revel vicariously in their leader’s (real and imagined) power. This attitude toward power legitimates the use of force and deception to solve problems and abets an ideological emphasis on the natural inequality of man, which justifies the oppression of one race (or sex) by another. In Chapter 6 of *Escape from Freedom*, published in 1941, Fromm said:

Usually Hitler tries to rationalize and justify his wish for power. The main justifications are the following: his domination of other peoples is for their own good and for the good of the culture of the world; the wish for power is rooted in the eternal laws of nature and he recognizes and follows only these laws. . . (p. 251).

Moreover, Fromm continued,

The second rationalization, that his wish for power is rooted in the laws of nature is more than a mere rationalization; it also springs from the wish for submission to a power outside of oneself, as expressed particularly in Hitler’s crude popularization of Darwinism. In ‘the instinct of preserving the species,’ Hitler sees ‘the first cause of the formation of human communities.’

The instinct of self-preservation leads to the fight of the stronger for the domination of the weaker and economically, eventually, to the survival of the fittest. The identification of the instinct

of self-preservation with power over others finds a particularly striking expression in Hitler's assumption that "the first culture of mankind certainly depended less on the tamed animal, but rather on the use of inferior people." He projects his own sadism upon Nature who is "the cruel Queen of all Wisdom," and her law of preservation is bound to the brazen law of necessity and of the right of the victory of best and the strongest in this world.

Fascism, Conservatism and Anti-Semitism

While *Escape From Freedom* remains Fromm's best known study of authoritarianism and Nazism, his empirical research on pro-fascist sympathies among blue-collar workers in the Weimar Republic actually in 1929, while he was director for social psychological research at the Frankfurt Institute for Social Research, under the directorship of Max Horkheimer. Horkheimer was accustomed to thinking of pro-fascist sympathies as an artifact or expression of Right-wing sympathies and was disagreeably surprised by Fromm's discovery that they are actually quite prevalent among Left wingers as well. For this and other reasons, Horkheimer refused to publish Fromm's study, which only appeared posthumously (Burston 1991).

Fromm left the Frankfurt Institute for Social Research – which had relocated to Columbia University in 1937 – in 1938 and was replaced by Theodor Adorno, who used Fromm's unpublished work as a pilot study, which informed his (much larger) study of pro-fascist and anti-Semitic attitudes among Americans, called *The Authoritarian Personality* (Adorno et al. 1952). Significantly, Adorno found no evidence of Left-wing authoritarianism in America, but did find striking correlations between "pseudo-conservative" trends and pro-fascist thinking and between (Right wing) anti-Semitism and intense religiosity, which appear to imply that there is some necessary or inherent linkage between intense religiosity and authoritarian (and/or anti-Semitic) trends. These findings may have been valid in their time and

place but must be taken with a grain of salt nowadays. Why? Since the 1950s, Left-wing anti-Semitism has grown apace, while conservatives like William F. Buckley and Barry Goldwater have made anti-Semitism anathema in American conservative circles. While it certainly has not disappeared from the scene, anti-Semitism is entirely overshadowed by philo-Semitic attitudes (on the Right). Therefore, efforts to replicate Adorno's study today would yield very different results.

Moreover, and more importantly, Adorno et al. shared Freud and Reich's assumption that religiosity is the expression of repressed inner conflicts, sublimated sadomasochism, or other "pregenital" libidinal fixations. The idea that religiosity per se is a symptom of immaturity or a derivative expression of psychopathological trends is an example of Enlightenment bias that Fromm, for one, never shared. Fromm had trained for the rabbinate before becoming a psychoanalyst and, though an atheist himself, held the spiritual traditions of the East and the West in high esteem. Indeed, Fromm devoted a chapter of *Sigmund Freud's Mission* (1959) to demonstrating the presence of authoritarian tendencies in a notoriously *irreligious* thinker, namely, Freud himself. Fromm's reflections on Freud's authoritarianism hark back to essays he wrote in the early 1930s on matriarchy and patriarchy and what he called "patricentric" and "matricentric" trends in individual and social psychology (Fromm 1959).

Authority

Daniel Burston
Department of Psychology, Duquesne University,
Pittsburgh, PA, USA

We tend to differentiate between different types of authority. Religious (or spiritual) authority, secular (or governmental) authority, and scientific authority are the three most common varieties. Ideally, each type of authority is supposed to be exercised in the public interest. Nevertheless, authority relations usually entail differences in status and power, so theories of authority are often rooted in a mood of skepticism, suspicion, or outright mistrust. So, for example, some theories stress the necessity of religious and secular authorities to constrain, punish, and perhaps pardon our sinful natures, or our allegedly instinctive tendencies to selfishness, lust, and violence (e.g., Augustine, Hobbes, Freud). These theories are rooted in a deep mistrust of human nature. By

contrast, theories that stress the arbitrary, irrational, repressive, and power-seeking aspects of authority (among libertarian and anarchist thinkers, for example) are rooted in mistrust of authority itself. Enlightenment critiques of religious authority were rooted in mistrust of tradition and “revealed truth.” Postmodern critiques of scientific authority are rooted in mistrust of scientific “objectivity” and so on.

Much as they clashed in the past, however, religious and scientific authorities have one crucial thing in common. As Freud’s friend, the Reverend Oskar Pfister (1873–1956) wisely observed, religion and science converge impressively in their conviction that “the truth shall make you free” (Pfister 1928). Historically, both religious and scientific authorities were predicated on their ability to discern and disseminate the truth. Secular authority, which is present in all branches of government, law enforcement, the judiciary, and the military, is different in this respect. Rather than discerning and disseminating the truth, its primary function is to maintain civic order and defend society against (internal or external) threats and enemies – preferably with the consent of the governed, of course.

However, much as science and religion share a belief in the emancipatory power of truth, they clash because their concepts of truth differ greatly, and they have very different methods of ascertaining it. And when religious authorities try to stifle the activities and utterances of scientists, hampering them in their efforts to discover and disseminate the truth according to their own discipline-specific theories and practices, the resulting backlash may be severe and potentially injurious to religion itself. Why? Because outraged scientists will insist even more stridently that religion’s authority is based entirely on ignorance, credulity, and superstition, fostering an irrational faith rooted in fear or wishful thinking, rather than in sound, sober analysis and patient reasoning.

That being said, secular and spiritual (religious) authority also clash frequently, sometimes with unexpected political outcomes. Consider Pope John Paul II’s successful campaign to end communist rule in Poland. And secular authorities may also declare a “war on science,” as the Bush administration and now the Trump

administration have done in the United States. At times like this, help may come from a former adversary, in the form of a papal encyclical like *Laudato si'* (May, 2015). In any case, most clashes between different modes of authority can broadly be described as *political*.

So, let us ask, is there one theory that accounts for all three types of authority? No, obviously, because the ways in which religious, secular, and scientific authority are defined, defended, or undermined depend the vagaries of history, language, geography, politics, and economics. And this is doubly true for modes of authority not addressed here, e.g., scholarly or pedagogical authority, artistic authority, etc. Nevertheless, there is a useful heuristic that sheds light on the diverse ways in which authority is experienced, interpreted, and exercised across different categories and cultures, one first suggested by the psychoanalyst Erich Fromm (1900–1980).

In a series of books including *Escape From Freedom* (1941), *Man For Himself* (1947), and *The Sane Society* (1955) Erich Fromm distinguished between rational, irrational, and anonymous authority. According to Fromm, rational authority is a relationship between two (or more) people of *unequal* age, experience, or status, where the person in authority, usually a teacher or parent, seeks to abolish those differences eventually, by bringing the student or child up to his (or her) own level (Fromm 1941, p. 186). Ideally, this relationship is based on mutual respect and is completely voluntary. While equality is the ultimate goal, the achievement of that goal requires discipline. In order to master a skill or a body of knowledge, the child pupil must follow the master's example, practicing diligently. The teacher, meanwhile, derives satisfaction from the student's progress, because it confirms his own knowledge and ability. In the event that the student matches or exceeds the master's level of knowledge and proficiency, the friction of competing egos is presumably contained and diffused by a disinterested love of the craft that they both share.

By contrast with rational authority, which is based on competence, consent, and mutual respect, and entails the possibility of equality, the principle of *irrational* authority is based on fear and is designed to perpetuate or intensify

conditions of inequality through the use of force, or the threat of force, and/or the use of deception, secretiveness and/or the manipulation of interpersonal relationships. Regardless of ideologies that disguise it as benevolent paternalism, or a liberating social force, irrational authority is really motivated by greed, fear, and a sadistic desire to dominate and humiliate others. Instead of promoting justice and equality, it stifles dissent and the rights of those who fail to obey. Those who practice irrational authority are threatened by the prospect of genuine equality, though they often enjoy a kind of sordid intimacy with others – which Fromm called “symbiosis” – to alleviate their loneliness or to consolidate their hold on power. As a result, irrational authority tends to stifle intellectual independence and sound ethical judgment, though it promotes the acquisition of cunning or a facile intelligence that is often conscience-free.

But despite their obvious differences, rational and irrational authority share an important similarity. They engage those affected by them in a highly *personal* manner. As Fromm noted in *Escape From Freedom*:

In external authority is clear that there is an order and who gives it; one can fight against the authority, and in this fight personal independence and moral courage develop. But . . . in anonymous authority both command and commander have become invisible. It is like being fired at by an invisible enemy. There is nobody and nothing to fight back against. (Fromm 1941, p. 190)

So unlike commonsense conceptions of authority, where differences in power, knowledge, or status are freely acknowledged, or rigidly insisted upon, *anonymous* authority manifests as timidity and group-think in groups of nominal equals; people who, in theory, anyway, are not beholden to anyone but themselves and their peers. Anonymous authority is not backed by overt demands or by threats and coercion, but by participants' fears of being “different” and a general lack of accountability. As a result, it produces bureaucratic “red-tape,” crushing anonymity and an attitude of slack conformity in groups whose members may share a diffuse identity, but lack any sense of meaningful connection to each other; what sociologist David Riesman (1909–2002) called “the lonely crowd.” Here the fear of being

isolated or merely “different” tends to lower standards and expectations; a proverbial race to the bottom. The consequent reliance on convention and public opinion, rather than on truth or genuine principle, renders those enmeshed in anonymous authority prone to apathy and opportunism (Fromm 1941, chapter 7). And unlike rational authority, which promotes equality, and irrational authority, which intensifies inequality, anonymous authority promotes a proverbial race to the bottom, while fostering a culture of “celebrity.”

The diffuse, impersonal character of anonymous authority renders it different from the other two modes. Another difference, said Fromm, is that it accompanies the rise of consumer culture, noting that this, and not the authoritarian personality, is the “pathology of normalcy” that prevails under capitalism in the post-War II era. Evidently, Fromm did not anticipate the precipitous decline of the American middle class in the 1980s, 1990s, and the twenty-first century, or the ravages of globalization and neo-liberal economic policies, which gave renewed impetus to irrational authority, to fascist and authoritarian leaders, and to ultra-nationalist movements all around the globe.

Meanwhile, what happens when, consciously or unconsciously, *most* people mistrust religious, secular, and scientific authority? For that is our present, postmodern predicament. In circumstances like these, people tend to invest authority in those whom they do trust the most (or perhaps, mistrust the least). Leaders of these derive their “authority” from the fact that tell their loyal followers what they want to hear, and what flatters and coincides with their own irrational fears and prejudices. When this happens, rumors, conspiracy theories, and urban myths abound, leaving many people without a moral compass and with a deeply distorted understanding of their actual situation. Indeed, they start to lose touch with reality and inhabit what R.D. Laing (1927–1989) called “social phantasy systems” (Laing 1961) and follow “opinion makers” and “sound bytes,” rather than real experts whose knowledge and honesty enables them to assess the facts impartially. This alarming state of affairs fosters the decline of democratic norms and institutions and promotes the growth of ultra-nationalist movements (Goldstein 2004).

As history demonstrates, organized religion seldom remains aloof these from alarming trends. On the contrary, it may intervene on either side as an ally of (or an alibi for) the angry mob, or as beacon of sanity and tolerance, and a principled opponent to prevailing trends and collective delusions of one sort and another.

Leaving secular and scientific authority aside, for the moment, can Fromm’s theory of authority be applied to religion in less turbulent times? Indeed, it can. Fromm linked rational authority to the unfolding of personal autonomy and what he called “humanistic conscience” and irrational authority to what he termed “authoritarian conscience,” or more simply, authoritarianism, in *Psychoanalysis and Religion* (Fromm 1950), *You Shall Be As gods: A Radical Interpretation of the Old Testament* (Fromm 1966), and *To Have or to Be?* (Fromm 1976). Though he occasionally delved into other faith traditions, Fromm focused primarily on Judaism, Christianity, and Buddhism, arguing that their sacred texts give credence and expression to *both* kinds of authority, albeit in different ways and at different times.

Sadly, some powerful religious leaders interpret their sacred texts to justify bigotry, hatred, inequality, and mistrust. Fortunately, however, many religious leaders also embrace and embody rational authority, including Mahatma Gandhi, Martin Luther King Jr., Abraham Joshua Heschel, Gregory Baum, Pope Francis, and the Dalai Lama. Nor is it an accident that their respect for human dignity and human rights had (or has) a political dimension, which brought them into conflict with secular authority (in various ways), or that Gandhi and King were both assassinated.

Fromm noted the similarity between extreme nationalist fervor and religious intolerance and was inclined to interpret ultra-nationalist movements and their hollow promises of redemption as modern day forms of idolatry, or as some religious scholars might prefer to say, as pseudo-religious movements (Fromm 1950, 1963). Fromm deemed the prohibition of idolatry to be central to the Jewish faith and the Prophetic temper, and the practice of idolatry (in this admittedly diffuse sense) to be utterly incompatible with the spiritual core of Judaism and Christianity. Fromm put the

issue succinctly in *Psychoanalysis and Religion*, at the end of chapter 1, as follows:

The psychoanalyst is in a position to study the human reality behind religion as well as behind non-religious symbol systems. He finds that the question is not whether man returns to religion and believes in God, but whether he lives love and thinks truth. If he does so, the symbol system he uses are of secondary importance. If he does not, they are of no importance. (Fromm 1950, p. 9)

Avalokiteshvara

Lee W. Bailey
Department of Philosophy and Religion, Ithaca
College, Ithaca, NY, USA

Avalokiteshvara is a high-level bodhisattva (“enlightenment being”) in Mahayana Buddhist tradition, expressing the important element of

compassion in the Dharma teachings. His name means “Lord who looks down [and hears the cries of the world]”. He was popular in India until the twelfth century, when Muslim invaders expelled Buddhists.

Tibetan *Vajrayana* tradition regards him as a Buddha. They developed many variations on his imagery, some with many faces or many arms. They see the ultimate source of his tradition as the universal manifestation of compassion itself. Some see the *Dalai Lama* as an incarnation of *Avalokiteshvara*, also named *Chenrezig*. His anthropomorphized images are useful ways of conveying his teachings to humans. Some Tibetan traditions tell the story that the goddess *Tara* came from one of *Chenrezig*’s tears that fell and turned into a lake, and a lotus grew up and revealed Tara. Another account portrays her emerging from his heart. Chinese Buddhists see him in the goddess *Guanyin*. Carl Jung would call these various images of the archetypal Self (Fig. 1).

Avalokiteshvara, Fig. 1 Avalokiteshvara as four-armed Chenrezig. (This figure is licensed under the Creative Commons Attribution-Share Alike 3.0 Unported license. <http://en.wikipedia.org/wiki/File:Chenrezigthangka.jpg>)

The Lotus Sutra

The earliest text about his teachings is the *Lotus Sutra*, Chap. 25, “The Universal Gateway of *Avilokateshvara Bodhisattva*” (*Lotus*). Here he is the savior of those who suffer dangers such as fire and shipwreck, beating or robbery. Wholeheartedly chanting the name of *Avalokiteshvara* will save those facing danger: “Homage to *Bodhisattva Avalokitesvara*” and respectful meditation on *Avalokiteshvara* will free one from desires, anger, or confusion. A woman wanting to have a baby boy or girl who reverently pays homage and makes offerings will be blessed. If needed, he can change himself into many forms: Buddha, other deities, spirits, a king, a brahman, a householder, even a child. When needed, he grants fearlessness. “*Avalokitesvara* displays such qualities, wanders through many lands in various forms, and saves sentient beings” (“The Gateway to Every Direction,” 2007, p. 298).

The Heart Sutra

The *Heart Sutra* is chanted in many Buddhist monastery ceremonies. It is a highly philosophical, paradoxical, and spiritual text. Its full title is the “Heart of the Great Perfection of Transcendent Wisdom: *Bhagavati Prajna Paramita Hridaya*” (Rinpoche and Donyo 1994). Once when the Buddha himself entered the meditative state of Profound Illumination, the Noble *Avalokiteshvara* answered seekers’ questions about ultimate reality. He taught that ultimately the material world (the five aggregates – earth, water, fire, air, and space) and our human egos are transitory, and so are ultimately unreal, or “empty”, of substantial being. But ego is deluded by becoming attached to its conventional perceptions and feelings. The only true reality is uncovered by awakening to the Great Perfection of Transcendent Wisdom, the undying ultimate reality. Then, the illusions of ego dissipate, consciousness aligns with the transcendent Self, found in meditative illumination, and suffering is overcome. *Avalokiteshvara* says:

The five aggregates themselves are empty by nature.... Form is emptiness. Emptiness is form.... In the same way, feelings, perceptions, mental formations, and consciousness, are empty.... There is no appearance, no sound, no smell, no taste, no touch, no phenomena. There is no ignorance, no cessation of ignorance... no old age and death, no cessation of old age and death (p. 10).

If these sayings perplex you, they are meant to confuse the ego. In meditation, slipping deeper than ego’s illusion of logic and control, one awakens to the *Prajna Paramita*, the Great Perfection of Transcendent Wisdom: “although all phenomena are lacking permanence, our mind remains prisoner of this conception; only Transcendent Wisdom can cut this conception at the root itself” (p. 33). But one need not feel frustrated; that is just ego. Just meditate quietly as long as it takes to awaken to the paradoxes: “Since there is no ignorance, there is no cessation of ignorance, because something that does not exist cannot cease. Likewise, there is no suffering, no origin of suffering, no cessation of suffering, no path” (pp. 38–39). The meaning of the *Prajna Paramita* is contained in:

Gate [“got-AY”], *Gate*, *Paragate*: Gone, gone, gone beyond

Parasamgate: Perfectly completely gone beyond

Bodi Soha: To awakening. (p. 42)

Applying these abstractions to particulars, we easily come to the passions, such as anger and aggression, which are the major causes of conflicts and wars. But happiness comes from the dissolution of these, not responding to anger with anger, but with compassion, opening our minds to the deeper realities of love and comforting words. Six perfections emerge from *Avalokiteshvara*’s compassion: giving (material possessions, security, and spiritual teachings), ethics (avoiding harm, keeping vows), patience (responding to aggression with love), diligence (maintaining meditative practice to keep compassion present), concentration (calmly focusing on love, not being easily distracted), and perfection of wisdom (knowing that the ego and its desires are earthly conventions, not ultimate reality) (Rinpoche and Donyo 1994, pp. 52–56).

Psychologically, this is what Carl Jung means by orienting the ego to serve not the many archetypal desires that clutter the mind, but the Self, the soul's compassionate spark of ultimate reality. Meditation is Buddhism's refined practice of orienting the ordinary ego to the highest spiritual reality: compassion.

Guanyin

When Buddhism was taken to China during the Han Dynasty (206 BCE–220 CE), *Avalokiteshvara* was translated into “*Guanyin*” with the same meaning “Lord who looks down [and hears the cries of the world]” and was at first pictured as a male Chinese monk with a thin mustache. But then *Guanyin* became female. Why would a male bodhisattva turn into a female? Of course, divine powers are beyond gender and can appear as they will. But also in the fifth century, an emperor had a vision of a feminine *Guanyin*, so a transformation from male to female occurred that was not seen before. *Guanyin* became a very popular female Chinese goddess, and still is. She is a major figure in popular religion and became a distinctly different divinity. She retained the very important, refined compassionate Buddhist core of *Avalokiteshvara*, and several Chinese elements were added. She retained *Avalokiteshvara's* savior archetype; like him, she was portrayed as responding immediately to sincere cries for help from people in desperate situations. But the humanistic Chinese did not care for the many-armed and many-headed images of Hindu deities, so they dropped those symbolic forms and synthesized her with their other deities, as is common in religions. John Blofeld sees in *Guanyin* some of the goddess *Tara* coming from Tibet (Blofeld 1977, p. 59). He also says

Kuan Yin sits enthroned as a folk goddess worshiped by millions upon millions. These, ignorant of Buddhist metaphysics, love her in the uncomplicated manner of the fisher-folk, recognizing in her the protective power and

rewarding nature of compassion. Images of her in this aspect are ubiquitous in China (Blofeld 1977, p. 64).

One of the most popular myths attached to *Guanyin* was the story of the girl *Miao Shan*. One version of her very symbolic tale is that her father demanded that she marry his choice of men, but she repeatedly refused and begged to go to a convent. Furious with her, he let her go, hoping that his princess would dislike the monastic austerities. But she was very devoted and did not return home, so he had his henchmen drag her into the forest, with orders to decapitate her. But she was rescued by a huge tiger. She was visited by the Chinese Buddha *Amita-fo*, who urged her to seek safety on the island in the bay south of Shanghai, *Pu-tuo*, and gave her a magic peach to sustain her. She meditated and did compassionate deeds and became a greatly revered *bodhisattva*. Thereafter, this island has become her holy island, with many temples and pilgrims (Blofeld 1977, pp. 69–71). This is a Chinese legend where the daughter, refusing to obey her father, dares to break the Confucian rule of obedience. She prefers to be a Buddhist nun, which he violently disputes and forces her to flee. In other versions, she returns to forgive and save him, since she was *Guanyin* all along.

Now *Guanyin* (also known as *Kannon* and other names across Asia) is a very popular uniquely Chinese goddess who synthesizes Buddhist, Daoist, Confucian, and indigenous shamanic elements. Many Chinese are not even aware of her Buddhist roots (Yu 2001, p. 223). *Guanyin* traditions are clearly rooted in Buddhist goddesses such as *Tara*, archaic shamanic Chinese goddesses such as The Daoist Queen Mother of the West (Eternal Mother), and Daoist goddesses such as *Ma Tzu*; in these historical roots and current practices are several psychological factors, such as relief from the ancient denigration of women as subservient and polluted. She thus contradicts psychology putting women in shadow and gives women a direct channel to the divine. *Guanyin* is also seen as a goddess of fertility, granting women children; some of her images show her holding a child (Yu 2001,

pp. 127–140). *Avalokiteshvara* remains the highest spiritual core of *Guanyin*.

Mantra

Mahayana Buddhism connects *Avalokiteshvara* with the six-syllable mantra: *Om mani padme hum*. People in Tibet especially recite this mantra frequently with prayer beads (*Avalokiteshvara*).

Avatar

Fredrica R. Halligan

Mind Body Spirit Institute, Stamford, CT, USA

Avatar (or *Avatara*) is an Indian concept meaning the descent to earth of a deity. In particular, Vishnu, the aspect of the Hindu Trinity who is devoted to preservation of the creation, is believed to have incarnated on earth many times. Whenever negative energies are rampant and the world is in great peril, in danger of imminent destruction or chaos, Vishnu is said to return. He comes to guide humanity back to righteous living (*dharma*) in order to preserve the harmonious order of the universe.

Interfaith Perspectives

Psychologically, we must compare this idea of Divine Incarnation with other traditions. It is well known that Christian belief in Jesus as Incarnate God impacts the whole belief system and worldview of the individual. In contrast, there is a somewhat more muted impact in Jewish and Moslem reverence for the prophets and in Buddhist reverence for the Buddha. For Hindus, like for Christians, the belief that God has incarnated on earth has profound psychological implications. Prayers to that incarnated Divine One are believed to be efficacious. This belief provides a strong resource for coping with the vicissitudes of life, an inspiration and model of behavior, and a supportive, calming religious-introject in the psyche of the believer. Unlike Christianity, however, the Hindu belief in Divine Incarnation is multiple.

Incarnation in the Hindu Tradition

Some of the earliest legendary *Avatars* were thought to take animal form (e.g., a fish, a turtle, a boar, and a hybrid man-lion), but for thousands of years, only human incarnations have been reported. These human incarnations have been

mostly male, but recently, a few female claimants have been reported (e.g., Mother Mira). The best known and most frequently worshipped *Avatars* are Rama, hero of the *Ramayana* epic, and Krishna, whose legends appear throughout the *Mahabharata* epic, ending with the *Bhagavad Gita* (Song of the Blessed One). In recent times, Sai Baba is also believed to be an *Avatar*, one who first incarnated in Shirdi and secondly reincarnated in Puttaparthi, India.

For the Hindus, as for many Western religions, God is Love. Thus, the *Avatar* is an embodiment of pure Love. Of the four major spiritual paths in Hinduism (*Jnana*, *Bhakti*, *Karma*, and *Raja*), *Bhakti* – the path of devotion – is most readily practiced in relation to an incarnate person. All humans are socialized to love other humans, so devotion to the *Avatar* is a natural extension beyond devotion to the family, to one's own *Guru* (teacher) and other humans. Like Jesus in Christianity, the *Avatars* are reported to be miracle workers, healers, teachers, and expansive lovers of all creation. They are believed to be fully divine as well as human. Their wisdom is meant for all humanity.

Purpose of the Avatars

In Indian thought, the Will of God (*sankalpam*) is to protect the structure of the universe, so *Avatars* arrive when evil threatens to vanquish good. These Incarnations are said to occur in response to earnest prayers by devotees, each manifestation suitable to the particular time and circumstance. The *Avatar* provides a role model of righteousness, truth, and compassion.

Avatars incarnate to renew the spiritual endeavors of humanity. By example they illustrate the tender, human side of the divine; and by their miracles they demonstrate God's power. They teach how to achieve God-realization. Humans cannot fully understand the nature of God until they merge with the Divine. The *Avatar* teaches essential processes towards that end, including adherence to truth, nonviolence, peaceful equanimity, and loving service of others. In the *Bhagavad Gita*, Krishna teaches the way to

merge with God: to be a willing instrument of God, acting in accord with Divine Will and leaving the outcome in God's hands. This equanimity is characteristic of *Avatars* and of advanced spiritual followers who merge with God, thus discovering their own true spiritual Self.

Axis Mundi

David A. Leeming

University of Connecticut, Storrs, CT, USA

Blanton-Peale Institute, New York, NY, USA

The axis mundi or world center is embodied for many cultures in such objects as world trees or centering towers (ziggurats, temple mounts, etc.) or mandala centers. In Native American pueblo cultures, the axis mundi is the place of the people's emergence into this world, symbolized by the small hole or sipapu in the center of the religious space, usually underground, known as the kiva. For Norse culture, the axis mundi is Yggdrasill, the great tree that in the creation myths links the various segments of creation – the lower world, the middle world, and the upper world. Axle trees such as this exist in many cultures. In Korea, it was believed that a sacred tree connected the three worlds of existence. For

ancient Tartars in Central Asia, a giant pine tree grew out of the earth's navel and reached to the home of the supreme god in the heavens. For Christians, the cross is a kind of world tree on the world center hill of Golgotha. A city or town can be the world center, as in the case of the Greek oracular center, Delphi, often called the world navel.

Symbolically speaking, then, the axis mundi is the object that embodies the essential identity of a culture – its center or soul. In terms of individual psychology, the axis mundi is an expression of the interaction between various segments of the psychic world. If we think of the axis mundi as a tree, this understanding becomes clear. The tree's roots are in the mysterious depths; its leaves reach to the sky and its trunk is the vehicle for the energy that derives from the roots and reaches up to the energizing power that comes from the sun. In terms of the individual's quest for wholeness or individuation, the tree's roots explore and take nourish-

ment from the subconscious – the unconscious world of dreams – where monsters are fought and lost treasures are to be found. The energy from this process makes possible the growth of the trunk – the lived life – and opens the individual to the budding and leaf-making which can be thought of as individual enlightenment or self-knowledge. The total tree is the unified Self.

B

Baal

David A. Leeming

University of Connecticut, Storrs, CT, USA

Blanton-Peale Institute, New York, NY, USA

The Canaanite god Baal was Yahweh's main opponent in the struggle for dominance among the ancient Israelites. Karen Armstrong points out that in difficult times the Israelites adhered to Yahwist worship, but that in peace there was a tendency to stray into the Baal worship of the Canaanites (Armstrong 1993, pp. 25–27). The Book of 1 Kings in the Bible tells us that the Baal-Yahweh conflict culminated late in the ninth century BCE during the reign of King Ahab of Israel. Ahab had married Jezebel, a follower of Baal, who was determined to convert Israel to her religion. The prophet Elijah led the fight against Baal, creating with Yahweh various tests which proved the power of his god and established the superiority of Yahweh and monotheism over Baal and his polytheism in the collective Hebrew mind.

Baal, however, was no mean opponent. He was a storm/weather god on whom the Canaanites depended for the fertility of their land. That fertility depended in part on Baal's relationship with the many faceted Great Goddess of Canaan – the goddess as his sister Anat or his mother or wife Asherah/Ashtoreth. Canaanite deities performed metaphorical roles reflecting seasonal

and climatic patterns. Annual ceremonies associated with what is known as the Baal Cycle celebrated the turn from winter to spring, from drought to nondrought, from infertility to fertility. It is likely that rites involving copulation between representatives of the gods were practiced to generate these transitions. Not surprisingly, the Israelites, who, as agriculturalists, depended on weather as much as the Canaanites did, were tempted to placate the weather gods, including Baal, Yahweh being a wifeless and “jealous” god not particularly concerned with the fertility of the land.

Most of what we know of Baal and the Baal Cycle – the series of events in the overall Baal myth – can be traced to texts from the library of the ancient city of Ugarit (modern Ras Shamra in Syria), a city abandoned in about 1190 BCE.

Baal was the son of El (>the god(s) – Elohim, al-ilah>Allah) and the Great Mother Asherah. As in Mesopotamia, where the Babylon city god Marduk replaced the old creator gods in importance or Greece, where Zeus took power from Kronos, Baal took effective control from El, went to war against the old gods, and defeated them. Only Death, the god Mot or Yam, remained to be confronted. Mot, representing total infertility, was the opposite of Baal. Baal was fertility itself as indicated by the fact that before accepting Mot's invitation (or challenge) to visit the Underworld, he took the form of a bull and mated eighty-eight times with a goddess who took the form of a heifer.

With Baal's descent into the Underworld – effectively, his death – the land above died. It was only with the intervention of Baal's sister Anat that Mot was defeated, dismembered, and “planted” in the earth, allowing a resurrected Baal and fertility to return to the world.

The story of Baal as a dying and resurrected fertility god has mythological relatives not only in the stories of Inanna's descent to and return from death and the Underworld in ancient Sumer and the revival of the dead Osiris in Egypt, but in the death and resurrection story of Jesus in the Christian tradition. Psychologically the descent into the Underworld is the collective psyche's attempt to assert itself against the inevitable power of death. A depth psychologist might say it is also a projection of the necessary and dangerous descent into the unconscious along the path to individuation. To achieve wholeness, it is necessary to confront the demons within. Only after such confrontation can the divine self – the god within – be awakened.

Baal Shem Tov

Mark Popovsky

Department of Pastoral Care, Weill Medical
College of Cornell, New York Presbyterian
Hospital – Chaplaincy, New York, NY, USA

General

Israel ben Eliezer (ca. 1700–1760), the founder of the Hasidic movement, was born in Ukraine at the beginning of the eighteenth century. Among devotees, he is most commonly referred to as “the Besht” – an acronym of his Hebrew title, Baal Shem Tov, literally “Master of the Good Name.” His purported ability to perform miracles accounts for the moniker as he was able to harness the power of the “good name” – that is, God's name – for healing. In his 30s, he emerged as a charismatic leader, storyteller, and traveling healer who quickly amassed a wide following among the impoverished Jews of Galicia. The Baal Shem Tov functioned mostly outside of the established communal structure. The stories told by his followers usually depict him as speaking in small groups or with individuals instead of preaching in the synagogue.

Core Teachings

The Baal Shem Tov preached an anti-establishment message, downplaying the importance of traditional text study as an act of piety in favor of narrative, song, and dance. Such spiritual practices are accessible to everyone, not only the educated religious elite. He taught that individuals attain spiritual redemption by striving for a state of constant joy, especially when worshiping. Rather than something to be restricted, physical pleasure is valued because it leads to spiritual pleasure which in turn brings one closer to God. Some of the Baal Shem Tov's sharpest criticism was reserved for Jewish leaders who encouraged asceticism through fasting or other rigorous practices which limited physical pleasure.

Though there is no evidence that the Baal Shem Tov was a scholar of Talmud or Jewish law, he did study Kabbalah (Jewish mysticism). Until his time, Kabbalistic traditions generally resided in the hands of a small elite and were not taught or practiced widely. Through his travels, the Baal Shem Tov attempted to popularize some Kabbalistic notions, especially those related to the idea that an individual can become one with the divine through spiritual practice and good deeds. However, he also rejected some Kabbalistic principles, especially those that encouraged individual isolation. The Baal Shem Tov and his followers were roundly criticized by many contemporaneous rabbis for oversimplifying complicated mystical teachings and for creating a cult that was preoccupied with miracles, talismans, and the supernatural.

Influence in Hasidic Movement

The Baal Shem Tov became the first of many Hasidic Tzadikim (“righteous ones”; sing: “Tzadik”). The Tzadik or “Rebbe” was recognized by his followers to have attained a higher spiritual level and was believed to have the power to elevate the souls of those in his community through his righteous acts and ritual practice. Consequently, the Tzadikim of the Hasidic movement garnered loyal and devout ad hominem followings, much more so than that of a standard rabbi in the non-Hasidic world. After his death in 1760, a number of the Baal Shem Tov’s grandchildren and disciples became Tzaddikim with their own followings. Within two generations, the Hasidic movement had spread throughout Eastern European Jewry attracting many adherents and simultaneously eliciting vigorous rabbinic opposition. It remained the primary spiritual orientation for many religious Jews in the region until the destruction of Eastern European Jewry during the Holocaust.

The Baal Shem Tov never wrote any works of his own; the stories he told were passed on orally among his followers. However, after his death, his scribe, Dov Baer of Linitz, compiled a collection of teachings, correspondences, and narratives in a

volume entitled *Shivhei Ha-Besht*, translated into English as *In Praise of the Baal Shem Tov*. Some modern scholars have argued that the Baal Shem Tov’s emphasis on the spiritual value of storytelling, extensive use of symbolic language, fascination with dream material, and veneration of physical pleasure indirectly influenced the thought of Sigmund Freud whose father was raised in the Hasidic tradition.

Historical Overview

In 1844, a young man named Siyyid ‘Ali Muhammad from Shiraz, Iran, who was a direct descendant of the prophet Muhammad, proclaimed Himself to be the Báb (the “gate” or “door”). In the Shi’ite sect of Islam, it is believed that the Imam Mahdí, or “rightly guided imam,” will come forth and bring in an era of justice and

peace. By proclaiming Himself the Báb, Siyyid 'Ali Muhammad was declaring Himself as the expected imam and forerunner of "He whom God shall make manifest" whom adherents believe was Bahá'u'lláh.

The Báb was rapidly gathering disciples, but this threatened the established clergy in Iran. He was quickly put to death by firing squad in 1850, and many of His followers, or Bábís, were massacred or exiled. In the meanwhile, the "Báb had left as his vicar, before the arrival of 'He whom God shall make Manifest' (. . .) Mirzá Yayá Nuri that was known with the name Subh-i Azal (Dawn of the Eternity)" (Bausani 2005, p. 196). Thus the group's leadership was bestowed on Subh-i Azal, until the one foretold by the Báb would come or reveal Himself. When, in 1863, Azal's half brother Mirzá Husayn Alí Núrí (or Bahá'u'lláh) declared Himself to be the figure promised by the Báb, there were according to the records, at least four sectarian divisions within the Bábí movement, triggered by disillusionment and disorganization. Nonetheless, "from then on the outstanding majority of the bábís pleaded with him and called themselves bahá'í, while the others, that went with their leader Subh-i Azal, exiled to Cyprus, called themselves Azalí" (Bausani 2005, p. 196), or Bayani.

Bahá'u'lláh was born in Tehran, Iran, in 1817, the son of a nobleman and minister. In 1863, after the death of the Báb and His exile, He declared Himself to be "He whom God shall make manifest" to a small group of followers. Shortly thereafter, He was banished to Istanbul and then to Adrianople, in the Ottoman Empire. There, He publicly proclaimed his mission. While in exile, He wrote many letters to world rulers and developed the unifying concepts that characterize the Bahá'í Faith. In 1868, Bahá'u'lláh was exiled yet again to 'Akká, Palestine, where He suffered harsh imprisonment for 2 years. This ordeal was followed by a house arrest that lasted until His death in 1892.

Leadership was passed on by Bahá'u'lláh to one of His sons, known as 'Abdu'l-Bahá, or "The Servant of Bahá," written in His will (Kitáb-i-'Ahd, The Book of the Covenant). 'Abdu'l-Bahá was released from prison in 1908

and promptly set out on missionary journeys to Egypt, Europe, and North America. After the death of 'Abdu'l-Bahá in 1921, His grandson, Shoghi Effendi Rabbani, was appointed, by the former's Will and Testament, as the Guardian, or next leader of the Bahá'í Faith. After Shoghi Effendi's death in 1957, the administrative duties were vested to the Universal House of Justice in Haifa, Israel.

World Vision

The Bahá'í Faith is an independent monotheistic world religion, founded in the middle of the nineteenth century, with communities in over 205 countries (Barrett 1988). People in the Bahá'í Faith regard Bahá'u'lláh, the prophet-founder of the faith, as a manifestation of God and consider His writings as divinely revealed.

Bahá'ís view the world as in constant social evolution and progress. At first, humans were united through families, clans, and tribes and in recent centuries through city-states and nations. Thus, different ages have different problems and require different kinds of treatments. Comparing the founders of world religions to physicians, Bahá'u'lláh declares that "Every age hath its own problem, and every soul its particular aspiration. The remedy the world needeth in its present-day afflictions can never be the same as that which a subsequent age may require" (Bahá'u'lláh 1983, p. 106). If there is only one God, and one progressive mankind, Bahá'ís believe, there is one religion that is also progressive. This idea, called Progressive Revelation, declares that throughout history, God reveals His word through messengers and/or prophets who have come to establish the religions we know now. This process of progressive revelation is never ending, since humanity will never cease to evolve; there is no culmination or finality in religion, as most creeds defend.

Bahá'ís claim that Abrahamic and Dharmic religions are from the same God and that they apply laws that are more coherent with the capacities of the peoples, according to their different stages of progress.

In this way, Bahá'ís are very optimistic. They believe evolution and progress is part of existence. Bahá'u'lláh declares that “This is the Day in which God’s most excellent favors have been poured out upon men, the Day in which His most mighty grace hath been infused into all created things” (Bahá'u'lláh 1983, p. 4). Bausani (2005) even comes to explain that this optimism originated at the very outset of the Bábí movement, when the Báb “criticized the materialistic concept of ‘end of the world’ from those who, precisely, await the mahdí and the hidden imám in the physical end of the world, and strengthens instead the cyclic-progressive doctrine of the manifestation of the divine, characteristic of Islam, declaring that with ‘end of the world’ is intended, in reality, the end of an historic-prophetic era” (p. 195). He adds that with the founding of the Bahá'í Faith “each traditional eschatology is abolished” (p. 197).

The Principles of the Bahá'í Faith

The main tenet of the Bábí and Bahá'í Faiths, one may say, is the unification of all religions and teachings and the promotion of the unification of humanity. Bahá'ís perceive God as an essence that manifests itself in numerous ways. The theology recognizes the great prophets and saviors of all major religions, but emphasizes the most recent revelations, given by Bahá'u'lláh, as the wisdom is designed for the scientific age. The teachings and laws of the Bahá'í Faith are set forth in such books as the *Kitáb-i-Aqdas* (“The Most Holy Book”). Bahá'í teachings have as their goal the improvement of the conditions of human life both spiritually and materially. Within these teachings, one may find individual rules such as one daily obligatory prayer; a 19-day period of improving devotional aspects of life by daily fasting; chastity and monogamous marriage with the consent of both parties’ parents and their own, indicating their being content with the will of God; the permissibility of divorce under developed antipathy or resentment, after the lapse of one full year to certify the desire of separation; compulsory education; obedience to government; the writing of a

will and testament; as well as prohibitions of imposing one’s interpretation of the Holy Writing, slavery, asceticism, monasticism, mendicancy, priesthood, intoxicating drinks and other drugs, gambling, murder, theft, cruelty to animals, backbiting and calumny, and contention and conflict (Bahá'u'lláh 1993, Synopsis and Codifications, sessions IV-A, IV-B, IV-C, IV-D).

On a broader level, the Bahá'í Faith calls all its believers to work on the implementation of those ideas that will elicit a New World Order, sustained by the application of principles such as the equality between men and women, the elimination of all kinds of prejudices, the spiritual solution to the economic problems, and a universal auxiliary language.

Having no clergy, each individual Bahá'í is encouraged to look into religious teachings with an unbiased mind and be responsible for his or her own individual beliefs and actions, which they also refer to as “independent investigation of truth.” The Faith has a system of administration based on a framework expounded by Bahá'u'lláh, which was elaborated by ‘Abdu’l-Bahá and implemented by Shoghi Effendi. At the local, national, and international levels of the administration, each governing body is comprised of nine members, elected by secret ballot, with no nominations or electioneering. At the local and national levels, these bodies are currently titled “Spiritual Assemblies” and they are elected annually – the Local Spiritual Assemblies by the members of their respective local communities and the National Spiritual Assemblies by delegates who have in turn been elected by Bahá'ís at a local/regional level. The international governing body, called the Universal House of Justice, has been elected once every 5 years since 1963, in Haifa, Israel, at an international convention attended by members of all National Spiritual Assemblies. In administering the affairs of the community, Bahá'í institutions practice a form of consultation that involves full and frank discussion of issues under consideration. Matters are discussed with a desire to ascertain the facts and to come to a decision that is based on spiritual principles and is unencumbered by personal attachments to points of view.

As well as coming together to worship, Bahá'í communities throughout the world are involved in social and economic development activities that serve the needs of local populations. These can range from simply assisting to clean up litter in their local areas to providing schools or running employment training, etc. National Spiritual Assemblies currently manage 1,500 development projects. The majority of the projects are the result of grassroots efforts operating with little or no outside support.

This goes hand in hand with ideas set forth by Jung (1999), who mentions that the main role of religion is to allow the individual the possibility to judge and make their own decisions (p. 506). If faith and knowledge conflict with each other, Jung declares, both of them may be showing signs of irrationality (Jung 1999, p. 521). In this sense, the Bahá'í Faith declares that religion and science should be balanced by reason: if one is inclined only to religion, he or she it may fall into fanaticism, and inclination towards science leads to materialism. And since "reality is one and cannot admit of multiplicity" ('Abdu'l-Bahá 1997, p. 227), this would limit the vision of reality and its phenomena – an idea similar to the concepts of reductionism brought by Frankl's Logotherapy.

Shoghi Effendi (1982) declares "The unity of the human race, as envisaged by Bahá'u'lláh, implies the establishment of a world commonwealth in which all nations, races, creeds and classes are closely and permanently united, and in which the autonomy of its state members and the personal freedom and initiative of the individuals that compose them are definitely and completely safeguarded" (p. 203); a system in which, 'Abdu'l-Bahá mentions, "free exercise of the individual's rights, and the security of his person and property, his dignity and good name, [must be] assured" (1990, p. 136). This is why, "Persons who have been attracted to the Bahá'í Faith but who decide, for whatever reason, to leave it are entirely free to do so" (commissioned by the Universal House of Justice 2005), excluding the right from any authority to supervise or even interfere with personal aspects of one's life.

A Bahá'í Psychology

This relatively young faith has many mystical, spiritual, or, if you will, psychological aspects to it. It emphasizes on the development of self in terms of morals and ethics and focuses on such virtues such as honesty, kindness, courage, altruism, etc., which defines a well-balanced and functional human being. Although Bahá'ís strive to develop a spiritually and psychologically healthy community, it seems likely, based on the stresses and strains of modern life, that counselors will have opportunities to counsel Bahá'ís. In particular, guidance in the Bahá'í writings urges them to use mental health professionals if necessary (Effendi cited in Hornby 1988, pp. 284–285). The teleological emphasis in the Bahá'í Faith is found in several therapies, particularly that advocated by Adler and Dreikurs. "Adlerian psychology regards a human being as a goal-oriented individual and considers everything the person does from the point of view of the goal" (Blumenthal 1988, p. 13). Counselors familiar with this approach could easily engage Bahá'ís in the therapeutic process by indicating this connection. The Bahá'í focus on the value of the rational powers of the human mind is an important factor in counseling. Therapeutic approaches such as cognitive behaviorism (Meichenbaum 1977) and rational-emotive therapy (Ellis 1962), which emphasize the use of reason to overcome emotional difficulties, may be quite amenable to a Bahá'í (Diessner 1990).

There are many prominent and well-known Bahá'í psychologists, psychiatrists, and therapists whose contributions to the world of psychology have been notable. Nossrat Peseschkian (1933–2010) was a specialist in neurology, psychiatry, psychotherapy, and psychosomatic medicine, who founded Positive and Transcultural Psychotherapy in 1968, based on a cross-cultural approach, and he was also the founder of the Wiesbaden Academy of Psychotherapy, a German state licensed postgraduate institute of psychotherapy (since 1971). Rhett Diessner, a professor of Developmental and Educational Psychology, and his scholarly research interests includes moral development and moral education, teaching

for understanding, and the psychology of love and unity. Khalil Khavari, Emeritus Professor of Psychology, served on the psychology faculty at the University of Wisconsin-Milwaukee from 1967 to 1995 and has been the research consultant to the US Veterans Administration and the “Psychobiology for the National Science Foundation,” a field reviewer for the United States National Institute of Health, and reviewer and/or an editorial consultant to a number of professional publications such as *Science*, *Journal of Studies on Alcohol*, *Journal of Abnormal Psychology*, *Pharmacology, Biochemistry, and Behavior*, and *Psychopharmacology*. Mary K. Radpour, Suzanne Alexander, Daniel Jordan, etc., are some among the many that can be named in the field of psychology and human development who have made vast and significant contributions to the progress society as members of the Bahá'í Faith.

Bahá'í: A Psychological Perspective

Hamid Peseschkian
Wiesbaden Academy of Psychotherapy,
Wiesbaden, Germany

Introduction

The Bahá'í Faith offers an interesting and challenging ground for psychologists: as the youngest

monotheistic world religion (founded in 1844), it is confronted with the challenge of individualism after millennia of collectivism in religious history; it has one of the most cultural diverse communities in the world (Bahá'ís live in more than 200 countries); its aim is the unity of humankind in diversity; harmony between science and religion is one of its main principles; the existence of thousands of pages of original and authentic scripture and biographical literature offers the unique possibility of independent investigation – just to name a few aspects which make the encounter between psychologists and this religion interesting. In the words of Bahá'í literature: “In this Revelation the concepts of the past are brought to a new level of understanding, and the social laws, changed to suit the age now dawning, are designed to carry humanity forward into a world civilization the splendors of which can as yet be scarcely imagined” (Universal House of Justice 1993).

Bahá'í laws and principles govern three areas which are also subject to psychological research: “The individual's relationship to God; physical and spiritual matters which benefit the individual directly; and relations among individuals and between the individual and society” (Universal House of Justice 1993). This entry will examine some Bahá'í principles out of each of these areas from a psychological perspective.

The Human Nature

One of the most important psychological aspects of any religion is its conception of man and human nature. The Bahá'í teachings, in common with all the divinely revealed religions, consider the human race as the highest and noblest form in the world of creation, capable of reflecting divine qualities. “And God said: Let us make humankind in our image, after our likeness” (Genesis 1:26) (Taheri 2005). According to Bahá'í belief, “we have three aspects of our humanness, so to speak, a body, a mind and an immortal identity – soul or spirit. We believe the mind forms a link between the soul and the body, and the two interact on each other” (Shoghi Effendi 1997). The individual soul comes into being at the moment

of conception and continues to live after physical death in the spiritual worlds of God. Although human beings have been endowed with all the divine capabilities, these are only latent in them at the time of birth. The development of human potential depends on education: physical, human, and spiritual education. The divine messengers are seen as true educators of humankind. Bahá'u'lláh (1994), the prophet-founder of the Bahá'í Faith, explains: “Regard man as a mine rich in gems of inestimable value. Education can, alone, cause it to reveal its treasures and allow mankind to benefit therefrom.” From a psychological perspective, we could call the Bahá'í conception of man positive, resource oriented, or salutogenetic. This concept that on the one hand humans are good by nature and that they have unlimited potential and on the other hand that only through a lifelong educational process, these capacities can be developed is a basic Bahá'í concept which helps to understand Bahá'í principles.

Free Will and Individual Responsibility

One of the key concepts of the Bahá'í conception of man is the existence of a free will. This free will is unlimited – to the extent that human beings can deny the existence of the creator of the free will. Indeed, the very action of choosing to establish a vital relationship to his Creator and to abide by his will constitutes the highest expression of human free will in this earthly life (Taheri 2005). The implications of free will are manifold and they are mainly linked to the importance of individual responsibility: one of the main Bahá'í principles is the “independent investigation for truth,” which implies that Bahá'í children, for example, have to decide from the age of 15 by themselves whether they want to belong to the community or not; there is no clergy in the Bahá'í Faith; therefore, it is governed by democratically elected institutions (“Spiritual Assemblies”), and individual Bahá'í are encouraged to participate actively in these elections; there are no candidates or election propaganda for these elections as this would limit the individual's choice to a few persons; there is no

confessing of sins in front of other persons – just to name a few implications. The individual's relation to society is explained as follows: “The Bahá'í conception of social life is essentially based on the principle of the subordination of the individual will to that of society. It neither suppresses the individual nor does it exalt him to the point of making him an anti-social creature, a menace to society. As in everything, it follows the golden mean” (Universal House of Justice 1997).

Self-Reflection

From a psychological perspective, the call for daily and lifelong self-reflection in the Bahá'í Writings is very interesting. Based on the Bahá'í view of the nature of man that a human being can be considered as *a mine full of gems* and that education is the “polishing process” for these gems, we can say that a process of external and self-education is necessary. The call for self-education required daily reflections which are much emphasized in the Bahá'í Faith. Bahá'u'lláh (1994) says in one of his major works: “O Son of Being! Bring thyself to account each day ere thou art summoned to a reckoning; for death, unheralded, shall come upon thee and thou shalt be called to give account for thy deeds.” The unique importance of reflection on one's behavior and course of life is reflected in this astonishing statement: “One hour's reflection is preferable to seventy years of pious worship” (Bahá'u'lláh 1994). This statement reflects also the basic principle of moderation – that even a good thing such as prayer should not be one-sided and superficial.

Purpose of Religion

Bahá'ís believe that there is only one God, the Creator of the universe. Throughout history, God has revealed Himself to humanity through a series of divine Messengers, each of Whom has founded a great religion. The Messengers have included Abraham, Krishna, Zoroaster, Moses, Buddha, Jesus, Muhammad, the Báb, and Bahá'u'lláh. This succession of divine Teachers reflects a

single historic “plan of God” for educating humanity about the Creator and for cultivating the spiritual, intellectual, and moral capacities of the race. The goal has been to develop the innate noble characteristics of every human being and to prepare the way for an advancing global civilization. Knowledge of God's will for humanity in the modern age, Bahá'ís believe, was revealed just over 100 years ago by Bahá'u'lláh, who is the latest of these divine Messengers (Bahá'í International Community 2012). Bahá'u'lláh (1994) related God's purpose for humankind to the two aspects of religion, the spiritual and the social: “God's purpose in sending His Prophets unto men is twofold. The first is to liberate the children of men from the darkness of ignorance, and guide them to the light of true understanding. The second is to ensure the peace and tranquility of mankind, and provide all the means by which they can be established.” At the same time, there is a clear warning regarding the misuse of religion for one's own ambitions:

Religion should unite all hearts and cause wars and disputes to vanish from the face of the earth, give birth to spirituality, and bring life and light to each heart. If religion becomes a cause of dislike, hatred and division, it were better to be without it, and to withdraw from such a religion would be a truly religious act. For it is clear that the purpose of a remedy is to cure; but if the remedy should only aggravate the complaint it had better be left alone. Any religion which is not a cause of love and unity is no religion. All the holy prophets were as doctors to the soul; they gave prescriptions for the healing of mankind; thus any remedy that causes disease does not come from the great and supreme Physician (Abdu'l-Bahá 2000).

Consultation and Conflict Resolution

In the Bahá'í Faith, authority has been vested in democratically elected institutions and not in individuals, as had always been the case in religious history. These institutions use a distinctive method of non-adversarial decision-making, known as consultation. The principles of consultation were laid down in Bahá'u'lláh's writings,

and as a procedure for building consensus and investigating truth, they have the potential for wide application. Indeed, Bahá'ís have found them to be useful in virtually any arena where group decision-making and cooperation are required. These principles are used not only by the Faith's own institutions but in Bahá'í-owned businesses, in Bahá'í-operated schools, and in day-to-day decision-making of Bahá'í families. In essence, consultation encourages diversity of opinion and acts to control the struggle for power that is otherwise so common in traditional decision-making systems. Bahá'í consultation is based on the following principles: Information about the underlying facts of the issues and their correlation to the teachings of Bahá'u'lláh should be gathered from the widest possible range of sources, seeking a diversity of points of view. During discussion, participants must make every effort to be as frank and candid as possible while maintaining a courteous interest in the views of others. When an idea is put forth, it becomes at once the property of the group. The group strives for unanimity, but a majority vote can be taken to bring about a conclusion and make the decision. An important aspect to this principle is the understanding that once a decision is made, it is incumbent on the entire group to act on it with unity – regardless of how many supported the measure (Bahá'í International Community 2012).

Purpose of Life and Life After Death

It is only in relation to the Creator, and the purpose which that Creator has fixed for His creatures, that human existence has any meaning. "The purpose of God in creating man hath been, and will ever be, to enable him to know his Creator and to attain His Presence. To this most excellent aim, this supreme objective, all the heavenly Books and the divinely-revealed and weighty Scriptures unequivocally bear witness" (Bahá'u'lláh 1994). Life should be seen as an eternal process of joyous spiritual discovery and growth. Through the daily struggles of material

existence, people gradually deepen their understanding of the spiritual principles underlying reality, and this understanding enables them to relate more effectively to themselves, to others, and to God. After physical death, the individual continues to grow and develop in the spiritual world, which is greater than the physical world, just as the physical world is greater than the world we inhabit while in our mother's womb. This last statement is based on the Bahá'í concept of the soul and of life after physical death. According to the Bahá'í teachings, the true nature of human beings is spiritual. The evolution or development of the soul and its capacities is the basic purpose of human existence (Bahá'í International Community 2012).

The Unity and Harmony of Religion and Science

For every unbiased person, one of the main principles of the Bahá'í Faith which really stuns is the unity and harmony between the two main forces of human life: religion and science. This principle has many consequences for both – the individual and collective life. It calls for a balanced life which integrates the needs of the body, the mind, and the soul:

We may think of science as one wing and religion as the other; a bird needs two wings for flight, one alone would be useless. Any religion that contradicts science, or that is opposed to it, is only ignorance – for ignorance is the opposite of knowledge. . . Religion which consists only of rites and ceremonies of prejudice is not the truth. Let us earnestly endeavor to be the means of uniting religion and science. . . Whatever the intelligence of man cannot understand, religion ought not to accept. Religion and science walk hand in hand, and any religion contrary to science is not the truth." "...weigh carefully in the balance of reason and science everything that is presented to you as religion. If it passes this test, then accept it, for it is truth! If however, it does not so conform, then reject it, for it is ignorance" (Abdu'l-Bahá 2000).

The implications of this fundamental principle show themselves in other laws and principles, such as that marriage is highly recommended, but not obligatory; that divorce is highly discouraged, but possible after a year of separation; that Bahá'ís are called upon to seek medical advice in case of illness; that there are exceptions regarding the application of the fundamental laws of daily prayer and fasting (medical reasons, pregnancy, illness, etc.); the importance of work; the importance of moderation in all things; the equality of women and men in all aspects of life; and the prohibition of asceticism – just to name a few principles. This principle of harmony of science and religion is based upon the premise that there is only one common reality. It is underlying all processes of community-building through the translation of revelation into social reality in a cycle of consultation, action, and reflection.

Bahais

Benjamin Beit-Hallahmi

Department of Psychology, University of Haifa, Haifa, Israel

B

The history of the Bahais presents us with a fascinating case study in religious, cultural, and psychological transformation. It starts with the appearance of the Babis, a millenarian group of Islamic origins, which developed out of the messianic Shiite tradition, founded by Ali Muhammad (1819–1850) of Shiraz, Iran, known as the Bab. Ali Muhammad proclaimed himself to be the Bab (gate) in 1844, a 1,000 years after the disappearance of the twelfth imam, according to Islamic Shiite tradition. (In the Shiite Muslim tradition, Muhammad ibn al-Hanafiya, who disappeared (or died) in 880 CE, is the Hidden Imam, who is in hiding and would come back one day to restore peace and justice.) The Bab, in Shiite lore, was supposed to announce the coming of one greater than himself, who would open a new era of peace and justice. At first, Mirza's claim was welcomed, but when he started deviating from the Islamic tradition, the reaction was violent. In 1848, the Babis declared publicly their secession from Islam, and 2 years later Muhammad was executed by a firing squad.

The group leadership was then assumed by two half-brothers, Yahya Nuri (1830–1912), later known as Subh-i Azal, and Husayn Ali Nuri (1817–1892), later known as Baha'u'llah. The next stage was a split in the movement which occurred when the former claimed to be the appointed successor, while the latter said that he was the prophet foretold by the Bab. Followers of Baha Allah started a new movement, Bahais.

The followers of Yahya Nuri, known as Azalis, continued the tradition of Babism. Their sacred book is *al-Bayan*, written by Ali Muhammad of Shiraz. According to this book, some elements of traditional Islamic law are abolished, and a promise is made of a prophet to come. The number 19 had central significance, and a calendar of

19 months, having 19 days each, was created. Another splinter group, the Bayanis, rejects Subh-i Azal and claims to follow the Bab alone.

The founder of Bahaism, Husayn Ali Nuri, known as Baha Allah or Baha'u'llah ("glory of God"), was a Babist who, while in exile and in prison, became convinced that he himself was the prophet or the Messenger of God, whose coming was announced by the Bab. He wrote the Bahai scripture *Kitab-i-Aqdas*, detailing the laws of the faith. In 1863, he announced that he was the promised "Manifestation of God." After his death, his son Abbas Effendi (1844–1921), known as Abdu'l-Baha ("servant of Baha"), was recognized as the leader and, starting in 1908, when he was released from prison after the "Young Turks" political reforms in the Ottoman Empire, undertook successful missionary work, especially in English-speaking countries. In 1921, the leadership passed to the founder's great-grandson, Shoghi Effendi (1897–1957). After his death in 1957, the movement was reorganized, and it is now being run by a nine-member body, known as the Universal House of Justice, elected in 1963. The world center of Bahaism and its holy places are located in Israel. Bahaism's holiest shrines are concentrated in the Haifa area, where the founder worked and died, and the Shrine of the Bab, with its golden dome, is one of Haifa's best known landmarks. The Bahai organization in the United States, among the largest in the world, is known as the National Spiritual Assembly (NSA) of Bahais in the United States. A National Spiritual Assembly (NSA) exists in more than 100 countries.

Bahaism, having distanced itself from Islam, claims to be a Universalist religion, preaching the religious unity of humankind and human equality. The religious prophecies of all past religions are supposedly being fulfilled now through the movement.

Baha'u'llah is described as the messianic figure expected by Judaism, Christianity, Islam, Zoroastrianism, Hinduism, and Buddhism. Earlier prophets are recognized, but with the coming of Baha'u'llah, the "Manifestation of God," a new

era has begun, lasting 5,000 years. It will lead to the Bahai cycle, lasting 500,000 years. This will happen only after a global catastrophe and the disintegration of the present world order.

There are rules covering prayers, fasting, marriage, divorce, and burial and prohibitions against political activities, homosexuality, and the use of drugs. Alcohol and pork are avoided. Prayers are said five times a day, and in addition, there are blessings for many everyday occasions. Bahais of West Asian origin are expected to follow special rules, in keeping with Islamic customs. The numbers 19 and 9 are considered sacred. All Bahais are expected to pay 19% of their earnings to the group. The Bahai calendar, which started in 1844, has 19 months, each having 19 days, and the year starts on March 21, following the Zoroastrian calendar. The 19 days preceding it are fast days till sundown. Bahais meet on the first day of the month, and regular meetings are devoted to scripture readings. Local congregations are tightly knit, and the private lives of members are closely supervised by the congregation and its leaders. While there is no involvement in politics, Bahais support the ideal of a world government and the activities of the United Nations. They have suffered prosecution in Islamic countries, especially Iran, where the persecution has become especially severe after the founding of the Islamic republic in 1979. According to Amnesty International, about 200 Bahais were executed between 1979 and 1992 in Iran.

Some descendants of Bahaism's founder, Baha'u'llah, have refused to accept leadership succession and organizational authority, as they were being marginalized by the leadership. The Bahai World Federation was founded in 1950 in Acre, Israel, by Amin Effendi, the founder's last surviving grandson, but it has become more marginal after losing all legal struggles against the majority leaders over Bahai real estate holdings and over official recognition by the State of Israel.

Since the 1950s, there have been several Bahai splinter groups in the United States which have predicted catastrophic floods and nuclear wars for 1963, 1980, and 1995. One such group is Bahais

Under the Hereditary Guardianship, known also as Orthodox Bahais or Remeyites, founded in 1960 by Charles Mason Remey (1873–1974), who in 1957 became a member of the Bahai collective leadership of 27, known as Hands of the Cause and also of the 9 Chief Stewards following the death of Shoghi Effendi. In 1960, he proclaimed himself to be the Second Guardian of the Faith and was declared a Covenant-breaker by the other members of the leadership, thus being excommunicated.

According to the group's doctrine of the great global catastrophe, major changes in the Earth's crust would lead the rise of the seas and the death of two thirds of humanity. Remey predicted in 1960 that a catastrophic flood would inundate most of the United States and urged his followers to move to the Rocky Mountains. This catastrophe was initially prophesied for 1963 and then postponed to 1995.

Bahais Under the Provisions of the Covenant (BUPC) is a US schismatic Bahai group, founded in 1971 by Leland ("Doc") Jensen (1914–1996). Jensen left the official United States Bahai organization in 1960 and joined the Bahais Under the Hereditary Guardianship. Noting the predictions of Charles Mason Remey about the impending flood that would cover the low lying areas of the United States in 1963, Jensen moved to Missoula, Montana, where he opened a chiropractic office in 1964. In 1969, he was convicted of sex offenses and sentenced to 20 years in prison. After arriving in prison, Jensen reported having a series of revelations and claimed the identity of several personalities mentioned in the Bible. Jensen combined Bahai teachings, occult ideas, and Christian eschatology to create the BUPC credo. He predicted a nuclear holocaust in 1980, followed by a thousand years of peace for those who would join BUPC and save themselves from destruction. He was paroled in 1973 and started recruiting followers immediately. April 29, 1980, at 5:55 pm. was the time specified by Jensen for a nuclear war to destroy one third of humanity. That would be followed by 20 years of added upheavals, starvation, revolutions, and natural

disasters, and in the year 2000, God's kingdom would be established, followed by 1,000 years of peace. About 150 followers made preparations for the nuclear holocaust. When this did not take place, revised predictions were issued. The group entered a period of crisis and decline but managed to survive.

The Bahai movement, which started as a heterodox Moslem sect growing out of Babism, has proselytized successfully in the West and now has followers on all continents. Its history reflects continuing psychological tensions between visions of apocalyptic destruction and of universal unity and peace. The appearance of dissident groups, competing with the main leadership, reflects these tensions.

We should keep in mind that this is a modern movement, started fairly recently, which has undergone quite a few transformations. At the leadership level, we can observe the expected conflicts stemming from personal ambitions and opposing visions. The movement has undergone a series of identity upheavals, involving social, psychological, and geographical changes, as its leadership has shown creativity and the ability to adapt and go beyond its historical origins too. What started in Shia millenarianism is today often perceived as a Western belief system, attracting followers all over the world. Its public image is clearly at variance with its complex history and the psychological processes which created it.

Baptism

David A. Leeming

University of Connecticut, Storrs, CT, USA

Blanton-Peale Institute, New York, NY, USA

Baptism (Greek: *baptein* = immersion) is a term usually applied to the Christian ritual of initiation by water, and it is the psychology of this ritual that will be addressed here. It must be noted, however, that such acts are by no means peculiar to Christianity. In many other traditions of the ancient and modern world, water is used for ritual cleansing and/or initiation. Ritual washings at death can symbolize a cleansing in preparation for the journey to another world, as in the case of the ancient Egyptians. The Greeks had many bathing rites, as, for example, in the washing of initiates entering into the Eleusinian mysteries. Jews have ablution ceremonies associated with washing away various forms of uncleanness. Muslims perform ritual ablutions before praying.

Baptism for Christians can be compared to Jewish circumcision in the sense that through baptism, the individual is “marked as Christ’s own forever” as in circumcision the Jew is marked as a part of his “nation” forever.

Christian baptism has immediate antecedents in the Jewish tradition of baptizing converts 7 days after circumcision and in the then radical practice of John the Baptist (the Baptizer) who performed the ritual in the Jordan River. Jesus came to John to be baptized into his life’s mission. It was apostle Paul (formerly Saul), in the early development of the Christian church as it broke away from its Jewish roots, who established the full symbolism of the baptismal ritual, one administered at various stages in Christian history at death, in early adulthood, or in infancy and in various ways according to the sect involved. The descent into or ritual administering of water in the ceremony was,

for Paul, a symbolic death based on the death of Jesus. Arising from the water, the initiate follows Christ’s resurrection and is reborn. The initiate dies to the old life and is reborn, this time into life as part of the Church, the “Body of Christ.”

There was always a psychological element to the sacrament of baptism for Christians, a sense of a new knowledge or understanding that comes through the new life. The early church father and theologian, Clement of Alexandria, believed that “baptized, we are enlightened.” In terms of modern psychology, baptism can become a symbol of the birth or recovery of self. Water has always been the symbol of pre-creation, the symbol of the universal mother, the primal birth waters. In baptism, it can be said that the initiate returns to the creative waters to be reborn as potential self, ready in this new state of being to confront the various traumas and passages of life and ultimately death itself. The descent into the waters can also be seen as a model for the necessary descent into the mysteries and traumas of the unconscious and the old life in order to be reborn, this time with the understanding making it possible to face the realities and challenges of the life ahead.

Baum, Gregory

Daniel Burston

Department of Psychology, Duquesne University,
Pittsburgh, PA, USA

Gregory (Gerhard) Albert Baum, an eminent Canadian (Catholic) theologian, was born in Berlin in 1923. His father, a military engineer, died when Gerhard was 1 year old. His parents were listed as “religionless” on official government documents, and he received a humanistic education in which the student is urged to strive for *Humanität*, or universal humanity. Nevertheless, as he later discovered, his grandparents on (his mother’s side) were Jewish, and as a result of Nazi racial laws, he and his sister fled Germany in 1939. Gerhard – or Gerd, as he was known to friends and family – arrived in England, where he briefly worked on a farm, and started to read the Bible. In 1940, he was placed in an internment camp where he encountered all kinds of German refugees – Jewish, Christian, liberal, socialist, anarchist, communist – and was shipped to Trois-Rivières, in Québec.

After a year of internment, with the help of a generous sponsor, Emma Kaufman of Kitchener, Ontario, in 1942, Gerd studied math and physics at McMaster University in Hamilton Ontario. In 1946, he read Augustine’s *Confessions*, and came under the influence of another German refugee, Egbert Munzer, who also fled Germany in 1939, but now taught at University of Toronto. Munzer introduced him to a community of Augustinian friars near Toronto who had also fled Hitler, and he applied for membership in the Order. He was accepted, and given the name Gregory. From then until 1946, he studied Latin, Greek, Aquinas, negative theology, completing a doctorate on ecumenism. From 1950 to 1959 he lived in an Augustinian monastery in Fribourg.

In 1956, Gregory read Jules Isaac’s book *Jesus and Israel*, and like Pope John XXIII, became

deeply concerned with the depth and pervasiveness of anti-Semitism in the Roman Catholic Church. He wrote a book denouncing anti-Semitism entitled *The Jews and the Gospel* (Baum 1961), which he sent to Isaac. While working on his book, he came into contact with a number of Catholic and Protestant leaders who were attempting to address the problem of Christian anti-Semitism, among them Cardinal Bea and John Oesterreicher, a priest who founded the Seaton Hall Institute of Judaeo-Christian studies. He also befriended the Jewish philosopher and Hegel scholar, Emile Fackenheim, at the University of Toronto. In 1960, Pope John XXIII appointed Baum as a *peritus* (or special advisor) to the Secretariat for Promoting Christian Unity, in which capacity he wrote an early draft of *Nostra aetate*, part 4 of which is expressly concerned with redefining the Church’s attitude toward the Jewish people, and set the tone for Catholic-Jewish dialogue ever since.

After the Second Vatican Council concluded, Baum returned to Canada, and in the late 1960’s taught Theology at St. Michael’s College and the Pontifical Institute at the University of Toronto, where he became acquainted with the work of Maurice Blondel and Karl Rahner, and with Martin Buber’s philosophy of human engagement in “I and Thou.” He also became deeply involved in the creation of an astonishing therapeutic commune called Therafields, which eventually morphed into the Toronto Institute for Training in Psychotherapy. From 1962 till 2004, he edited *The Ecumenist*, a progressive Catholic journal.

From 1969 to 1971, Gregory studied sociology at the New School for Social Research, and became deeply conversant with the ideas of the Frankfurt School of Social Research. The Frankfurt School had attempted to integrate the disparate perspectives of Karl Marx and Sigmund Freud with the sociology of Max Weber (among others), and is particularly well known for its work on the psychology of anti-Semitism and authoritarianism (e.g., Adorno et al. 1950; Burston 1991). Baum felt a particular kinship with Erich

Fromm, a sociologist and psychoanalyst whose ideas about religion, alienation and society paralleled and, in some instances, prefigured many of his own (Burston 1991).

In 1970, Baum was summoned to return to monastic life; a summons he did not heed. That same year, he published *Man Becoming: God in Secular Language*, a book inspired by Maurice Blondel, and in 1975, published *Religion and Alienation*, which many believe was his most important book. Shortly after this, Baum left active ministry, and in 1978, married an ex-nun named Shirley Flynn. In 1986, Baum and Shirley left for Montréal, where he taught sociology at McGill University. It was there he first encountered the work of economist Karl Polanyi and theologian Fernand Dumont, both of whom influenced him profoundly. In 1990, he became an officer of the Order of Canada, an honor bestowed on him for his contributions to ecumenism and interfaith dialogue. And yet, despite his fame in Canada, Baum was quite sympathetic toward the separatist cause in Québec. With the passage of time, he was also increasingly concerned with the plight of Palestinians living under Israeli occupation, and became actively involved in Christian-Muslim dialogue.

Clearly, Baum was not afraid of controversy. Despite the Vatican's disapproval, he defended Liberation Theology during John Paul II's papacy, and in 1974, became the first Catholic theologian to defend the ethical status of homosexual love in an article for *Commonweal*. Throughout the 1980s, he worked with the Conference of Canadian Bishops to address the deepening inequality and economic injustice brought about by the Canadian Federal government's neo-liberal policies. His openness towards the ordination of women and gay marriage, which were well known, still provoke outrage and consternation among many conservative Catholics.

Baum was a great believer in dialogue, openness and religious pluralism. But despite his Marxist sympathies, he strongly opposed post-modern relativism, warning of its harmful consequences for social and political life. He often remarked that the years following Vatican II were buoyed by considerable hope for the future, but that the world had darkened considerably

since the first American invasion of Iraq in 1992. In 2011, he complained that Vatican II, of which he had been an integral part, has been put "in a deep freeze", though he greeted the election of Pope Francis as a very hopeful sign.

Shirley Flynn died in 2007, and Baum mourned her passing for the remainder of his life. Nevertheless, he remained extremely prolific, and continued to lecture at McGill post-retirement, until his death on October 18th, 2017. A remarkable man, well known for his kindness, courage and lucidity, Baum was an unconventional thinker, a gifted sociologist and a great theologian.

Berne, Eric

Gerardo Del Guercio
York College, The City University of New York,
New York City, NY, USA

Born on May 10, 1910, in Montreal, Quebec, Canada, as Leonard Bernstein to Doctor David Hillel Bernstein and to writer as well as editor

Sarah Gordon Bernstein, Eric Berne was a prominent figure in the area of psychology (Calcaterra, n. pag). His sister Grace was 5 years younger than Berne and no other brother or sister existed. The Berne's family immigrated to Canada from Poland and Russia where both David and Sarah Bernstein would later graduate from McGill University in Montreal (n. pag). Being close to his father, Berne spoke affectionately about going with his father on medical runs via horse-pulled toboggan on ice in the frigid Montreal winters.

Sadly, tuberculosis cut David Bernstein life short at age 38. Forced to support the family in a single parent capacity, Sarah Bernstein continued her professional career. She motivated Eric to emulate his father and take up medicine in Montreal where he completed medical degrees at McGill University's prestigious Medical School in 1935, attaining stellar grades and praise from the faculty of medicine.

Eric Berne entered the United States in 1935 after being accepted for an internship at New Jersey's Englewood Hospital. Twelve months afterward Berne finished up his internship and subsequently commenced "his psychiatric residency at the Psychiatric Clinic of Yale University School of Medicine, where he worked for 2 years" (Calcaterra, n. pag). Mount Zion Hospital in New York City awarded Berne his first post-residence – a station he held until 1943 when he joined the Army Medical Corps. Alongside with his position, Berne commenced his own office in Norwalk, Connecticut. In addition to practicing in Norwalk, Berne met and married Elinore McRae. Together they parented two children: Ellen Berne (born 1942) and Peter Berne (born 1945).

Eric Berne elevated to fame through his engagement with the technique transactional analysis. This system integrated rudiments from psychoanalysis in addition to cognitive theories of human behavior, and it provided theories on the interplay of personality and individual development. Berne's transactional analysis theory states that:

people can exist in three ego states: adult, parent, and child. A person functioning in the adult role – also called the neopsyche – has healthy interactions that are not heavily influenced either by emotions or by baggage from childhood. (Rubinstein, n. pag)

Those in the function of the child – the archaeopsyche – assume behavior prototypes comparable to their infancy behavior, most times in order to resolve childhood difficulties. Case in point, a person may mope or show displeasure due to an inattentive parent. People responsible for the parent's role – or exteroopsyche – copy their parents' response to other people. In transactional analysis, each interaction between people is a pact where all participants assume one of three roles.

Eric Berne had almost nothing invested in religious conviction, despite the fact that religion has played an important role in transactional analysis. Thomas Harris argues:

[t]he Parent-Child nature of most western religions is remarkable when one considers that the revolutionary impact of most revered religious leaders was directly the result of their courage to examine Parent institutions and proceed, with the Adult, in search of truth. It takes only one generation ... for an inference about experience to become a dogma. (15)

Transactional analysis is a good technique in helping people religiously in de-parentifying spiritual outlooks and viewpoints. In doing so, transactional analysis allows individuals to form independent adult values founded on personal devout probing and breakthroughs. By letting go of their protuberance of hurtful parent attitudes onto God, a person is liberated to practice the fostering, affectionate parent- and truth-asserting adult perspectives of God's soul.

To sum up, Berne's last days were complicated ones. A heart attack struck Berne down in June, 1970. Later in the same month, Berne experienced piercing chest and back pains, which ended up being the aftermath of the heart attack. Although Berne was making a slow recovery, a few weeks later, he suffered a second this time fatal heart attack. Eric Berne died tragically on July 15, 1970. At the time of his death, Berne was putting together the galleys for his next book *What Do You Do After You Say Hello* while in his hospital bed. Widow, Torre, of Carmel, California, a daughter, three sons, and two stepchildren (Illson, L+) outlived Berne; his remains rest at the El Carmelo Cemetery in Pacific Grove, California.

Bhagavad Gita

Fredrica R. Halligan
Mind Body Spirit Institute, Stamford, CT, USA

The *Gita*, as it is affectionately called, has been described as the bible of the Hindus. It is a verse Upanishad and has become widely known even in the West because it has been the daily reading of Mahatma Gandhi as well as millions of other Indians. The story of the *Bhagavad Gita* is the tale of the Mahabharata war, the great conflict of good and evil. In this epic tale of war between cousins, the Pandavas won out because they relied entirely on God. Arjuna, the Pandava prince and accomplished archer, turns to Krishna, his friend and charioteer who is God in disguise, for answers to the great questions of life.

Imagine! A man we can all identify with is in dire straits, at a crossroads, brought to his knees by the great pressures and complexities of life, shakily reaching out. And his best friend, an incarnation of God, takes his hand and walks him through the answer – explaining step-by-step the most profound secrets of all ages (Hawley 2001, p. xxiv).

The *Gita* is thus the story of a psychological war we all wage within, and the answers given teach us how to live so as to win God's grace.

Chapters 2 and 12 are the most significant in their messages to humanity.

The Gita's Essential Wisdom

In Chapter 2, Arjuna is bent down with worry and remorse, not wanting to begin the battle that will cause the bloodshed of so many of his family and mentors. In response, Krishna teaches him that (1) we must each do our duty, (2) the death of the body is not the death of the person because the soul (*Atman*) lives on (with a description of the doctrine of reincarnation), and (3) to be an instrument of the Divine is to be in union with God. This third point is the essence of the wisdom of the *Gita*. When we surrender to God and dedicate all our actions to the Divine One, then we can get beyond our own egos and allow God to take over. We must "Let go and let God" (as this same thought is reworded in the 12-step programs for recovery from addictions today).

To accomplish this vital surrender to God, we must let go of our personal desires, and we must leave the outcome in God's hand. This leads to equanimity, when we neither relish the praise nor cringe under accusations and blame that may accompany the outcome of our actions.

The central points of issue, Arjuna, are desire and lack of inner peace. Desire for the fruits of one's actions brings worry about possible failure – the quivering mind I mentioned. When you are preoccupied with end results, you pull yourself from the present into an imagined, usually fearful future. Then your anxiety robs your energy and, making matters worse, you lapse into inaction and laziness. . . .

Work performed with anxiety about results is far inferior to work done in a state of calmness. Equanimity – the serene mental state free from likes and dislikes, attractions, and repulsions – is truly *the ideal* attitude in which to live your life (Hawley 2001: 20f).

This spiritual wisdom has profoundly beneficial results in psychotherapy today. It is, of course, counterculture in the USA to talk of desirelessness and relinquishing the fruits of our labors, but anxiety disorders can be ameliorated by

psychoeducation with this “wisdom of the East” in mind.

God's Most Beloved Devotees

In Chapter twelve of the *Bhagavad Gita*, Krishna teaches Arjuna that God especially loves those who are genuinely devoted and surrendered to Him, those who love and serve others, and those who are possessed of equanimity. In the expression of particular love, Krishna in the *Gita* teaches humankind how to live in harmony with God's Will. He states that he loves most:

He who hates no being, who is friendly and compassionate to all, who is free from the feeling of ‘I and mine,’ even-minded in pain and pleasure and forbearing.

Ever content, steady in meditation, self-controlled and possessed of firm conviction, with mind and intellect fixed on Me, he My devotee is dear to Me (Chidbhavananda 2000, p. 658).

This is a profound statement of how to live a spiritually oriented, values-based lifestyle, as valid today as it was thousands of years ago when the *Bhagavad Gita* was written. In a recent, more Western translation, Krishna is also saying:

I love those who do their worldly duties unconcerned by life. I love those who expect absolutely nothing. Those who are pure both internally and externally are also very dear to Me. I love devotees who are ready to be My instrument, meet any demands I make on them, and yet ask nothing of Me.

I love those who do not rejoice or feel revulsion, who do not yearn for possessions, are not affected by the bad or good things that happen to and around them and yet are full of devotion to Me (Hawley 2001, p. 112).

Sai Baba (q.v.), a contemporary *Avatar* in India, teaches that the wisdom of the *Gita* provides guidance for all humans who live today. He summarizes:

The great teaching of the *Geetha* is: ‘Put your trust in God, carry on your duties, be helpful to everyone and sanctify your lives.’ Dedicate all actions to God. That is the way to experience oneness with God. God is in you. You are in God. This oneness is the basic truth. Chant the name of the Lord and render social service in a spirit of selflessness and devotion to God (Sai Baba 1995, p. 235).

Oneness with God has long been the aim of the mystical traditions of all religions. These small clues on how to attain that sense of union are vital for all spiritually oriented clients in psychotherapy or spiritual direction. To dedicate one's daily actions to God is a profound spiritual practice with beneficial results in both the psychological and spiritual dimensions of life.

Bible

Jeffrey B. Pettis

Department of Theology, Fordham University,
New York, NY, USA

The Bible (Greek, “the little books”) constitutes a collection of writings understood to be sacred and essential for the life and worship of Judaism and Christianity. Most of these works are compilations of various oral and literary traditions ranging from the second millennium BCE through the second century CE. They reflect the life and narrative of various groups and sociopolitical contexts of a monotheistic religion taking on distinct qualities and notions of ritual and worship. The Book of Genesis expresses many of the themes which permeate the Bible as a whole. The account of the creation story (Gen.1–3) sets forth the creative powers of the Divine to bring about life ex nihilo

("out of nothing"). This is YHWH who is mighty and receives sacrifices from patrons to appease his temperament and persuade his actions in the mortal, material world: "And Noah built an altar (Hebrew, *mzbch*) unto the Lord... and offered burnt offerings on the altar. And the Lord smelled a sweet savor; and the Lord said in his heart, I will never again curse the ground any more for man's sake" (Gen. 8.20–21). Compare Isaac's altar at Beersheba (Gen. 26.25), Jacob's altar at Shechem (Gen. 33.20), Moses' altar at Rephidim (Ex. 17.15), and Solomon's altar at Gibeon (1 K. 6.20; 8.64).

The notion of "revelation" also occurs as a central theme in Genesis and other texts, the purpose and needs of the Divine being made known to the heroes of the Jewish people. Abraham has a revelation that his people will become a great nation (Gen. 12.1–4) and that God is with him as a "shield" (Gen. 15.1). At Bethel, Jacob has a dream of angels ascending and descending a ladder and awakens afraid, knowing that he has been encountered (Gen. 28.10–22). His son Joseph dreams and interprets dreams through which the divine purpose becomes realized (Gen. 37–50; cf. 1 Sam. 3; 1 Sam. 28; 1 Kings 9; Isa. 6.1). Compared to the Canaanite religion of that time, the notion of afterlife in the Jewish scriptures is minimal. Covenantal existence with God in the present world through faithfulness to Torah receives the primary focus. To be in right relation with YHWH is to experience the goodness and blessing of a full life: "Blessed is the one who does not walk in the counsel of the ungodly... but delights in the law of the Lord... He shall be like a tree planted by the rivers of water, that bring forth fruit" (Ps. 1.1–3). It is not until the latest writing of the Jewish scriptures, such as the Book of Daniel (168–165 BCE), that any clear notion of resurrection and life after death occurs (Dan. 12; cf. Ezek 37; Isa. 24–27). Embraced by Jewish groups such as the Pharisees and the Essenes, it is this belief which becomes central for early Christian communities and its writings. Paul writes how Jesus died, was buried, and was raised on the third day according to the scriptures. Jesus then "became

manifest" (*ōphthē*) to Cephas, then the twelve disciples. "Then he appeared to more than five hundred brethren at one time" (1 Cor. 15. 3–6). Paul himself had a theophanous (appearance of the divine) experience while traveling to Damascus. The event leads to his conversion to Christianity as one of its strongest advocates (Acts 9.1–22; 2 Cor. 12.1–5; 1 Cor. 9.1; cf. 1 Cor. 15.5–7). His understanding that a person is justified through faith and not through the works of the Law (Gal. 3.10–14) points to the cultural and political conflict over religious identity and the issue of Gentile (non-Jewish) membership in Jewish Christianity. Jesus as the "Son of Man" (Matt. 16.27–28, 10.23; Mark 10.45; cf. 1 Tim. 2.5–6; Eph. 5.2; Titus 2.13–14) may be understood to continue the Son of Man in Judaism and occurs in the Book of Daniel (Dan. 7.13–14), a writing itself part of apocalyptic tradition especially rooted in the Maccabean wars (168–65 BCE) and the Jewish resistance to the oppression of Antiochus Epiphanes the Seleucid King of Syria (Dan. 7.8; 8.9; cf. 11.31; 12.11). He is the central figure who points to the anticipated "new age" of divine justice and redemption, where those who have suffered and died for the sake of their faith will be restored to new life (cf. 1 En. 46–48; 4 Ezra 13.3, 51 f.; 1 Cor. 15.37–50). According to Jung, in Christian Gnosticism, the Son of Man is the Original Man, a visualization of God as Archanthropos, and the real organizing principle of the unconscious (Jung 1969, p. 203). As an apocalyptic and visionary, Jesus as the final sacrifice (John 6.53–54) is presented in the Gospels expecting a dramatic change of world order. In Matt. 1.15, he declares: "The time is fulfilled (*peplērōtai ho kairos*) and the kingdom of God is near" (cf. Matt. 4.17, 16.28; Luke 4.19). Christ is both Messiah and "Lord" – an apocalyptic identification which is unique to early Christianity and its reading of sacred text (see Ps. 110.1; cf. 11QMelech). Paul too anticipates the return of Jesus and new world order: "For the Lord himself will descend from heaven with a cry of command, with the archangel's call, and with the sound of the trumpet of God" (1 Thes. 4.16;

cf. 1 Cor. 13.12, 15.1–6; 2 Cor. 3.18). For Paul, the new age begins with Christ's resurrection and will conclude with his return. The Book of Revelation, the last book of the Bible and dated around the end of the first century CE, presents this age as the "new heaven and new earth" (Rev. 21.1).

However, by the third generation of Christianity, the immediate return of Christ and notions of millennialism lessen as the church focuses (necessarily) more on the manifest practice of its beliefs in the present world. Implicit within this shift is an interest in evangelism and personal witness that roots Jesus' life and resurrection in history. Unlike Paul's inward mysticism and his notion of the "spiritual body," the Gospels present the fleshly resurrected Jesus (John 21.24–31) who appears for the salvation of the outward world: "Go tell the disciples and Peter that he goes before you into Galilee; there you will see him, as he told you" (Mark 16.7). The Jesus of the Gospels has a missionary emphasis and a focus upon faith in the apostolic tradition. This more material-world orientation becomes a foundation for the formation of the "church" in concrete terms. The Book of Acts is a good example of the story of the church establishing itself in the Greco-Roma second century world. Other writings such as the Epistle of James, 1 Peter, and 1 Timothy show this religious-social shift from Pauline interiority and the numinous to the outward and literal orientation. In this way, the unconscious processes and content of religious experience in Christian and Jewish scriptures are becoming conscious and formulated. This includes the instituting of rituals such as the Eucharist and baptism and codes of behavior, dress, and diet.

Biblical Anthropology

Dylan Blaine
Louisville, KY, USA

Biblical anthropology is uniquely centered on the image of God in man. Interestingly, Christian Scripture does not explicitly define the exact character of this image and instead focuses on God's identity and on His redemptive plan for mankind. Modern Bible interpreters are left to examine the image of God in man historiographically, comparing theologians' attempts to provide a definition from church history alongside the Christian Scriptures.

Psychology and the Image

Throughout history, the image of God in man has remained a mystery. Within the church, various iterations of this doctrine have all centered around man's relationship with God. Outside the church, ideas about the ultimate nature of humanity are varied and have long involved discussion of a soul irrespective of a creator. In Plato's (428–348 BC) *Dialogues*, the soul of man is described as a charioteer and two horses, one good and one bad (*Phaedrus* 252). In this way, Plato talks of the complexity of man and an inner division that causes tension. Aristotle (384–322 BCE) felt that the soul of man came from the elements of nature and that the kind of life found in humans was

similar to vegetable life (*De Anima* 411.1–4). These philosophers had a profound impact on the Church Fathers, many of whom had training in philosophy before they wrote to edify the church. Later theologians up until the Reformation looked to the Scriptures to define man within their largely religious worldview. With the advent of the Enlightenment, an increased skepticism began to supplant discussion of the divine in man. Notably, William James (1842–1910 CE) discussed the difference between spiritualists and those who see the mind as a projection of the brain and consciousness, with the former calling the soul the source of human consciousness (James 1862, 223). Subsequent explorations have most often focused on introspection and behavior rather than on speculations about the ultimate source of observable phenomena. Psychology proper, like anthropology, has developed an empiricist and materialist delimitation that often excludes questions of the transcendent. In contrast, the Bible deals overtly with the transcendent meaning of human life, beginning with God’s act of creation. By examining the Bible, church history, and key observations from the world of psychology, a more complete picture of the image is more readily available.

The Image in Scripture

The concept of God’s image in man is found in the Bible in the first chapter of Genesis. In Genesis 1:26, “God said, ‘Let us make man in our image, after our likeness’” (Genesis 1:26 ESV). In other portions of the Old Testament, this idea is not overtly discussed. However, the *Imago Dei* remains a presupposition upon which the development of the biblical concept of humanity rests. With the advent of Jesus in the New Testament, an entirely new aspect of humanity is presented, as Jesus compares the image of God within man to a Roman coin being stamped with the Caesar’s likeness (Mark 12 and Matthew 22). Paul pointed to Jesus’ example throughout his writings, most notably explaining that Jesus is “the image of the invisible God” (Colossians 1:15). The relationship between Jesus’ role as image bearer and the role of image bearer of Adam or of other fallen

humans remains unclear. Man being an image bearer allows man’s culpability for sin and need for a savior.

Church Fathers and the Image

Church Fathers were prominent thinkers and apologists in the early church whose writings remain highly influential for the modern church. Though their teaching varied regarding the *imago Dei*, each sought to explain the concept in light of Genesis and the writings of Paul, and they often sought to directly define the image of God in man.

Origen (185–254 CE) lived and taught in the second and third centuries in Alexandria, Egypt. Like many of the Church Fathers, he was influenced by Greek philosophy. In his writings against Celsus, he limited the image of God in man to be a part of the “inner man,” delimiting this characteristic to the communicable properties of God (Orig., Cont. Cels. 6.63). Origen also believed Christ to be made in the image of God and for man to be made in the image of Christ, reinterpreting Genesis in light of Paul’s writings.

Methodius (d. 311 CE) was a third- and fourth-century Greek bishop who was influenced by Plato. He pointed to the soul’s immortality as being the quality in which the image of God is found (Methodius, Symposium 5.2). Gregory of Nyssa (c.335–c.395 CE) explained that if something made to be the image of an original is changed, that it loses the quality that makes it an image in the first place but adds that in the case of humanity, our capability for human kindness points to God’s role as the image and our ability to participate in God’s will and actions (Greg. Nyss., De hom. Opif. 16).

Augustine of Hippo (354–430 CE) was a fourth- and fifth-century North African theologian and apologist who offered a complex discussion of the image, explaining how a Trinitarian God is imaged by a single, relational human, not imaged by three human persons. He expounded on 1 Corinthians 11:7 by writing that human nature is only complete in both sexes, without excluding women from being able to fully display the image

of God just as is done by men (Aug., *De Trin.* 12.7.10). His version of theo-psychology remains a clarifying statement for Christians who wish to understand the self in relation to God.

Athanasius of Alexandria (296–373 CE), fourth-century Egyptian theologian, felt that the image in man was lost due to the Fall but could be restored via salvation through Christ (Ath., *De inc.* 13.2). Perhaps in response to Athanasius' view, John Cassian, a monk in fifth-century Gaul, taught that the image of God in man is the image of Christ, and not merely restoration of something that was lost in man at the fall. Cassian made a distinction between Christ and Adam in this way to refute the idea that the restorer of the image is nothing more than the destructible image in man (*De incarnatione* 7.8).

Medieval Theologians and the Image

Conflict outside the church was marked by Church-sanctioned armed conflicts, most notable being the Crusades. Bernard of Clairvaux and Richard the Lion Hearted of England were prominent examples of those who were committed to war as a means to earthly ends. During this age, Raymond Lull (c.1232–c.1315), a thirteenth-century Franciscan layman and missionary to Muslims, believed that the image of God in man included the soul *and* the body, citing the incarnation of Christ.

A contemporary of Lull, Thomas Aquinas (1225–1274 CE) was a Dominican monk and apologist who was committed to viewing the image of God in man as differing from His likeness, the latter being the ideal form of the image.

Reformers, Puritans, and the Image

John Calvin (1509–1564 CE) displayed his acute understanding of the biblical text when he admitted that previous interpreters had placed a linguistic division between likeness and image in meaning, Augustine being chief among them. Calvin believed the image to reside in the soul of man, further explaining our lack of a proper

definition of the image. He blamed sin for a lack of knowledge, explaining that the whole of man takes part in displaying this image, though it is heavily marred in light of the Fall. Complete knowledge of the image of God in man would take place in heaven.

Jonathan Edwards' (1703–1758 CE) preaching contributed to the American Great Awakening of the 1740s. He wrote of the Fall as marring the image and of God as the one who restores the image. The image, in Edwards' thought, was divided between *natural*, *spiritual*, and *moral*, with man displaying the natural aspects in his ability to choose moral excellence.

John Owen (1616–1683 CE), English nonconformist, denied that the dominion mandate from Genesis 1:28 provides proper understanding of the image of God in man, explaining that the image is found in moral excellence. He also explained that the image regained in salvation surpasses that of man's first family in the Garden of Eden. His Christ-centered vision of the image focused on Jesus as a moral exemplar.

Recent Thoughts on the Image

At the dawn of the twentieth century, Abraham Kuyper (1837–1920 CE) wrote in a way that engendered a movement called Neo-Calvinism. He divided the image into a nature, which could be lost, and an essence that remains in man. A contemporary of Kuyper, Herman Bavinck (1854–1921 CE), posited a broad definition containing the whole of man, including the human soul, his faculties, and the body. Karl Barth (1886–1968 CE) believed that man and woman together composed the image of God. G.C. Berkouwer (1903–1996 CE), a twentieth-century Dutch theologian, also contributed to the discussion by counting the whole of man as the image. Rejecting dualism, he nevertheless admitted that the image remains a mystery. Wolfhart Pannenberg (1928–2014 CE), twenty-first century Lutheran theologian, incorporated philosophy and the social sciences to outline his view of the image, one that strongly mirrored the reformers' idea of an ethical or behavioral ideal.

The Image in Retrospect

Despite this multitude of well-meaning speculations, modern Hebrew and Ancient Near East scholar Gordon Wenham (b. 1943) explains that the image and likeness of God in man is used interchangeably in the text. He believes that an office, rather than a characteristic, is the true function or consequence of the image of God in man. A textual clue to its meaning is found in Genesis immediately after man's creation in the dominion mandate, a useful key to navigate competing ideas for the nature of the image: man is created to act as a representative ruler on God's behalf on the earth. Since Israel had contact with Egypt, modern interpreters ought to recognize that some aspect of this concept finds its source in the Ancient Near East.

Christians throughout history have attempted to understand the nature of the image of God in man in various ways. Though the biblical definition of the *imago Dei* is not entirely clear, the ontological foundation tying man's nature to God is a necessary element of the biblical worldview. The absence of the exact nature of the image of God in man leaves an excellent placeholder for the more fully detailed picture of Christ as the image of God in the New Testament, which is positively positioned for increased spread and acceptance of the gospel. Humans are insatiable in their search for truth. Questions about our own nature can ultimately lead us to Jesus Christ as the truest picture of the image of God. Some modern thinkers may hunger for additional knowledge, creatively constructing novel concepts or revisiting traditional ideas about the *imago Dei*. James R. Beck explains that the Christian belief about human personality not only includes mental constructs, such as the mind, but also includes spiritual features of humanity, such as the soul or spirit (Beck 1999, 18). Unless great care is taken in determining what a person is from the perspective of their creator, anyone risks stepping out beyond the headlights of a true Scriptural hermeneutic. David Entwistle points to the implications of the image of God in others and the accompanying ethical demand of relating to other image bearers in light of biblical teachings,

especially in the context of the church (Entwistle 2004, 151).

Evidenced by the speculation of biblical interpreters in church history, there has been a desire to tie human identity to divine purpose and meaning. Similarly, psychology seeks to understand the inner workings of man, emphasizing behavior and observably imminent events in order to predict and promote human flourishing. Christianity claims that human flourishing is not limited to this life alone and points past this earthly life to an eternity with God as being the *highest* goal. Christianity and psychology operate in the same realm but have differing ultimate goals. This difference does not mean that they are in conflict, and wise interpreters will do well to take into account data from both theology and psychology when determining the meaning of God's image in man.

Biblical Narratives Versus Greek Myths

Kalman J. Kaplan¹ and Matthew B. Schwartz²

¹Departments of Psychiatry and Medical Education, University of Illinois in Chicago, Chicago, IL, USA

²Department of History, Wayne State University, Detroit, MI, USA

Fifty years ago, Dr. Eric Wellisch, medical director of Grayford Child Guidance Clinic in England, called for a Biblical psychology, arguing that

The very word “psyche” is Greek. The central psychoanalytic concept of the formation of character and neurosis is shaped after the Greek Oedipus myth In ancient Greek philosophy, only a heroic fight for the solution but no real solution is possible. Ancient Greek philosophy has not the vision of salvation . . . There is need for a Biblical psychology (Wellisch 1954, p. 115).

Religious leaders in traditional societies often performed the function of applying the psychological wisdom implicit in the Biblical religious traditions to the particular life problems of members of their flock. Rabbis, priests, and pastors used Biblical wisdom to help people with concrete real-life problems. The contemporary situation is very different. The therapist is largely ignorant of if not antagonistic to religion, often in a manner incongruent with the patient’s own orientation.

Several studies, for example, have found that over 90% of patients believe in a transcendent God, compared to only about 40% of clinical psychologists. This is a huge disconnect! Most mental health professionals avoid reference to or

recognition of their patients’ religious beliefs and the deep influence of these beliefs on patients’ lives. Few mental health professionals fully incorporate a patient’s religious beliefs into a treatment plan.

There are a number of possible reasons for the resistance toward religion on the part of mental health professionals and for the resistance of religious leaders to the insights and findings of the mental health field. For one, the fields of religion and mental health have historically been in conflict with each other with psychology/psychiatry allying itself to science and medicine. Second, psychology/psychiatry often has approached issues of spirituality in a superficial manner, treating spiritual development as something foreign to the development of the individual personality. Third, issues regarding life meaning are too often relegated to the theological realm alone. Fourth, much of the biological cause of mental illness has been relegated to psychology and psychiatry. Finally, much of traditional psychotherapy has been based on classical Greek rather than Biblical foundation models. For example, traditional psychoanalysis has focused on Greek foundation stories such as Oedipus, Electra, and Narcissus rather than on respective Biblical alternatives such as Isaac, Ruth, and Jonah.

In a series of books on religion and mental health, we (Kaplan and Schwartz 1993, 2006, 2008; Kaplan et al. 1984; Schwartz and Kaplan 2004, 2007) have delineated ten important contrasts with regard to mental health between classical Greek and Biblical thinking: (1) the primacy of God versus nature, (2) the harmonious relationship of body and soul, (3) the cyclical versus linear conceptions of time, (4) the relationship between self and other, (5) the relationship between man and woman, (6) the relationship between parent and child, (7) sibling rivalry and its resolution, (8) the relationship between freedom and suicide, (9) the question of rebelliousness versus obedience, and finally (10) a tragic versus therapeutic outlook on life. Let us briefly describe each of these Hellenistic biases in mental health and suggest a Biblical alternative.

God and Nature

Hesiod's *Theogony* portrays Earth and Sky mating and giving birth to the titans, in particular Cronus, who later begat the Gods. In other words, nature exists before the gods and creates them. The family pathology commences immediately, as the Sky father shoves the children back into the Earth mother. Such action of course breeds reaction, and Earth repays Sky, by plotting with their son Cronus to castrate his father. The father-son conflict becomes ingrained as a law of nature foretold by Earth and Sky.

The Biblical story of creation sees God as creating heaven and earth. In other words, God exists before nature and creates it (Gen. 1:1). God then proceeds to create order out of chaos. First, light is divided from darkness (Gen. 1:24). God then divides water from the land (Gen. 1:9). Then, God begins to prepare this world for the entrance of man. First, He has the earth bring forth vegetation (Gen. 1:11). He places living creatures in the sea and fowls in the air (Gen. 1:20). Now God places living creatures on the earth – cattle, God creates creeping things, and other beasts (Gen. 1:24). The world is now ready for people, and them, His ultimate handiwork, in His own image and gives them dominion over all that He has created (Gen. 1:27–29). There is no irreconcilable conflict between people and God, between man and woman, or between parent and child.

Body and Soul

Plato sees the relationship between body (soma) and soul (psyche) as conflictual and unfortunate. The soul is a helpless prisoner in the body, compelled to view reality only indirectly and unclearly (Phaedo, 82d). Plato, perhaps following Orphic teachings, called the body a prison of the soul, and others with comparable ideas called it a tomb (The Oxford Classical Dictionary 1970, p. 895).

In Biblical thought, the human body and soul are both sacred, both created by God. They can and must function in harmony to fulfill God's purpose in the world. Emotion, intellect, and body are all integral components of a human

being, and there is no opposition between body and soul or flesh and spirit (Urbach 1979).

Conceptions of Time

The pervasive Greek view of time is cyclical, mirroring the seasons of nature. A man rises up only to be overcome by hubris (pride) and cast down into nemesis (retribution), the nadir of the circle.

The Biblical view of time is linear, freeing itself from the cyclical seasons of nature. History begins in God's creation, continues with His ongoing revelation to man, and ends in God's messianic age. The book of Ecclesiastes distinguishes the cyclical view of time regarding natural events: "The sun riseth, and the sun goeth down." (1:3–7) from the developmental view embedded in human events "To everything there is a season, and a time for every purpose under the heaven: A time to be born, and a time to die" (3:1–8).

Self and Other

Greek thought sees self and other as fundamentally opposed. One wins at the expense of another losing. The legend of Narcissus is prototypical in this regard. The earliest sources of the myth of Narcissus have long since been lost. Our most complete account from antiquity is from Ovid's *Metamorphosis* (ca. 43–17 CE). Although physically beautiful, Narcissus leads a life full of precarious oscillation between self-absorption and infatuation with another, which turns out to be his own reflection. He ends up in his psychotic attempt to integrate self and other, and he suicides (Conon 1798, p. 24; Ovid 1955, p. 3): "Alas! I am myself the boy I see. . . I am on fire for love of my own self." The Apollonian side of Greek culture relies totally on a walled-off and disengaged intellect. The Dionysiac side of Greek culture portrays an enmeshment which destroys individual boundaries.

Biblical thought sees self and other in harmony. Jonah avoids the polarities of

disengagement and enmeshment. When he runs away to Tarshish (Jonah 1:1–3), God acts as a protective therapist, saving Jonah from suicide on several occasions: first, with a fish (2:2–11) and then with a gourd (4:6). Jonah finally learns the message of divine mercy (4:9–11) and that he can reach out to another without losing himself. In the words of the Jewish sage, Hillel, “If I am not for myself, who will be for me? If I am for myself only, what am I?”

Man and Woman

Greek narratives portray men and women in basic conflict. Pandora, the first woman, is sent by Zeus as a punishment to man because Prometheus has attempted to steal fire for man to make him autonomous. Pandora is given many gifts to entice man but, ultimately, is seen as responsible for man’s destruction and as a block to his autonomy. She opens the box she has brought to Epimetheus containing all the evils of the world, leaving only hope left locked inside and unavailable to humanity (Hesiod and Theognis 1973, pp. 60–96).

Biblical narratives portray men and women as different, but in basic harmony.

Eve is sent as a blessing and partner, a “help-meet opposite,” not as an instrument of punishment. Together she and the man are seduced by the serpent to eat of the fruit of the tree of knowledge, and while this leads to their expulsion from Eden, they do not die but build a life together with divine help and hard work (Genesis 2 and 3).

Parents and Children

Fathers and sons: Laius/Oedipus versus Abraham/Isaac: The Greek story of Oedipus portrays the father (Laius) and the son (Oedipus) in basic conflict. The father is told by an oracle that his son will kill him and marry his (the son’s) mother. Such a conflict is originally portrayed in the Greek theology discussed above and describes a pattern where the father feels the son is trying to displace him and the son feels the father is trying

to block him. The story begins with Laius trying to kill Oedipus and proceeds with Oedipus killing Laius and marrying his mother, Jocasta (Sophocles, *Oedipus Rex*). This conflict is resolved in Freudian thinking through a fear of castration. This is the basis of the introjection of the superego for the son, and thus it is fear based (Freud 1923a, b, 1924).

The Biblical story of Isaac portrays the father Abraham receiving the gift of a son, Isaac, late in his and his wife Sarah’s lives. Abraham then receives the command from God to sacrifice this son that he loves to God. However, this is only a test, and Abraham demonstrates his loyalty to God, Who sends an angel to stay Abraham’s hand, preventing child sacrifice which had been so prevalent in surrounding cultures. The blessing of Abraham will continue through Isaac (Genesis, 22). Covenantal circumcision can be seen as a non-injurious alternative to castration, transforming the father into a teacher and the son into a disciple. The father wants the son to both succeed and surpass him. The mother is not a seductress but a harmonizer. The basis of morality is thus not fear but a covenantal relationship between God, father, and son. The son does not need to rebel against the father because he already has his father’s blessing.

Mothers and daughters: Clytemnestra/Electra versus Naomi/Ruth: The Greek story of Electra portrays a basic antagonism between mother (Clytemnestra) and daughter (Electra). Clytemnestra accuses Electra of preferring her father, Agamemnon. Electra accuses Clytemnestra of being unfaithful to her father. She and her brother Orestes murder their mother (Aeschylus, *Agamemnon*, Euripides, *Electra*). This story of Electra has been used by Jung as a term for a “feminine Oedipus complex” (Jung 1961, pp. 347–348).

The Biblical Book of Ruth tells of the relationship between the Moabitess Ruth and her mother-in-law, Naomi. Even when Ruth’s husband dies, she refuses to abandon Naomi. Naomi does not try to block Ruth and, indeed, facilitates her marriage to Naomi’s kinsman Boaz, who is impressed by Ruth’s kindness to Naomi. Naomi is brought into the household as a nurse to their son Obed who is described as the father of Jesse, who is father of

David. There is no hint of the antagonism between mother and daughter implicit in the Electra complex.

Siblings and Family

The Hebrew Scripture contains many stories of sibling rivalry: Cain and Abel (Genesis 4), Isaac and Ishmael (Genesis 17–25), Jacob and Esau (Genesis 25–27), and Joseph and his brothers (Genesis 37–50). The greater incidence of sibling rivalry in narratives in Genesis than in Greek mythology is misleading. It is a function of the underlying purpose of the Biblical family – the sons compete to inherit the covenant of the father. The father’s blessing can help resolve this rivalry, as with Jacob’s blessings to his sons, each uniquely given the blessing he needed to suit his own personality and his situation (Genesis 49).

The Greek family is purposeless. The father is not a source of inheritance but an impediment. Sibling rivalry is initially masked by the threat of the father to the sons, who must band together to protect themselves: Uranus versus his sons (Hesiod and Theognis 1973: ll. 155–210), Cronus versus his sons (ll. 453–725), Zeus versus Heracles and Iphicles (Hesiod 1914: ll. 35, 56 and 80), and Oedipus versus Polynices and Eteocles (Sophocles, *Oedipus at Colonus*; Aeschylus, *The Seven Against Thebes*). However, this bonding is shallow and will disappear as the paternal threat recedes. This pattern is expressed tragically in the curse of the weakened and blinded Oedipus to his two sons to slay each other at the gate of Thebes (Sophocles, *Oedipus at Colonus*, ll. 1386–1394; Aeschylus, *The Seven Against Thebes*, ll. 879–924).

Freedom and Suicide

Like and mythological, the Stoics clearly approved of suicide. The Roman Stoic Seneca, for example, saw suicide as freedom. “You see that yawning precipice? It leads to liberty. You see that flood, that river, that well? Liberty is housed within them. You see that stunted, parched and sorry tree? From each branch, liberty hangs. Your

neck, your throat, your heart are so many ways of escape from slavery. . . . Do you inquire the road to freedom? You shall find it in every vein of your body” (Seneca, *De Ira*, 3.15.3–4). Indeed, for Plato, philosophy is “preparation for death.”

Biblical thought is clearly opposed to suicide as no better and perhaps worse than homicide. “For your lifeblood too, I will require a reckoning” (Genesis 9. 5). The human being is commanded to choose life: “See, I have put before you today life and death, blessing and curse, and you shall choose life so that you and your seed shall live” (Deuteronomy 30.19). Freedom is seen not in suicide, but in life following God’s commandments. “Read not *harut* (carved) but *herut* (freedom). One is not free unless he devotes himself to the study of Torah” (Avot, 6.2). Indeed, Hebrew thought sees the Bible as a “guide for living.”

Rebelliousness Versus Obedience

A great deal has been made of the clash of Islamic and Western (European, American, and Judeo-Christian) civilizations. Yet, there is a more profound line of demarcation between those cultures that view rebellion and rebelliousness as the highest form of development (e.g., Albert Camus) and those that view obedience to the divine will as the highest goal. The underlying message of the Nuremberg trials of Nazi war criminals after the Second World War was to mock the defense “we were just following orders.” Thus, the mantra of the West came to be a distrust of *authority* per se (i.e., parents, community and religious leaders, and law and system of morality) rather than of a particular authority. Yet, the Bible criticizes the Israelites, newly freed from Egypt, for building a golden calf (Exodus 32). The question of rebelliousness versus obedience is complicated. In Greek mythology, Zeus cannot be trusted. Prometheus must rebel against him to help human beings. Prometheus steals fire for men, who are then punished by Zeus by means of the woman Pandora. In Biblical thinking, in contrast, God can be trusted and indeed must be trusted. According to Talmudic interpretation of the Biblical story of creation, God has provided

the means for Adam to invent fire (Midrash Genesis Rabbah, 11:2). Thus, the serpent is tempting Eve with the siren call of disobedience, but in Biblical teaching, this act is sinful. In short, one must know who one's god is. If it is Zeus, one should rebel: if it is the Biblical God, one should obey. This does not mean we should not question a particular authority. However, this is different than questioning the very idea of authority.

Tragedy Versus Therapy

Bruno Snell (1935) has argued that the differences in the respective orderings of God and nature are not just chronological, but logical and psychological as well. The Classical Greek view is deterministic and the essence of the tragic vision of man; the Biblical view is intrinsically open to the possibility of change and transformation and lies beneath the idea of genuine psychotherapy. Before the Biblical God, nothing is impossible: He can cancel the natural order of things, alter it in any number of ways, or, indeed, create something out of nothing, just the way He created nature. A Greek god is confined to acts that may show his power but that cannot truly transcend natural law or defy fate. Lev Shestov (1966) argues very much the same thing, insisting that the Biblical God is not subordinate to necessity. The Greek view of tragedy and the Biblical view of therapy can be contrasted in two main points. First, bad family background is impossible to overcome in the Greek tragic vision: "But now, I am forsaken of the gods, son of a defiled mother, successor to his bed who gave me my own wretched being" (Sophocles, *Oedipus the King*, ll. 1359–1361). However, a bad family background can be overcome in the Biblical therapeutic vision: "Cast me not off, neither forsake me, O God of my salvation. For though my father and mother have forsaken me, the Lord will take me up" (Psalms 27:9–10).

There is a profound difference between the Greek and Biblical vision with regard to the efficacy of prayer and a general sense of hopefulness. For the Greeks, prayer is useless in this determined world: "Pray thou no more; for mortals

have no escape from destined woe" (Sophocles, *Antigone*, l. 1336). The Bible believes in the efficacy of prayer, even in the most hopeless of situations.

Biblical Psychology

Jeffrey H. Boyd
Waterbury Hospital, Waterbury, CT, USA

Mindfulness, a Buddhist view of human experience, is widely employed in psychology today. Every major religion offers a view of human experience, i.e., a spiritual psychology. The most popular is the biblical view. There are two billion people in the world who say they are Christian, one billion Muslims, 0.8 billion Hindus, 0.4

billion Buddhists, 0.02 billion Jews, and 1.6 billion people who are none of the above. The biblical view is shared by those who call themselves Jews, Christians, and Muslims.

There is more than one biblical view. For example, in the book of Joshua, there is a ferocious attitude toward people of other religions ("kill the Jebusites"), whereas Jesus taught us to live peaceably in a pluralistic society ("love your neighbors").

The Bible's God-Centered Approach

The Bible from a Christian perspective offers a God-centered view of people. God is the creator, rescuer, and goal of humans. Comparing today's popular psychology with the biblical approach is like comparing a pre-Copernican to a Copernican model of the solar system. Popular psychology teaches clients to love themselves and trust their own understanding. The Bible teaches that we should "Trust in the LORD with all your heart and lean not on your own understanding" (Proverbs 3:5). Claudius Ptolemy said that the sun and planets revolve around the earth. Nicolaus Copernicus said that the earth and planets revolve around the sun. We are facing a similar debate in psychology today. Popular magazines, TV, and public opinion teach that you are the center of the psychological universe: "believe in yourself." The Bible proposes that you revolve around God, meeting or frustrating God's wishes: "believe in God."

Self-esteem is considered essential in popular psychology today, because you are the center of value in a pre-Copernican solar system. Self-esteem is almost completely absent from the Bible. Often self-esteem is viewed as a problem, as in the quote above from Proverbs 3:5. All value comes from God. Humility is valued: we should worship and obey God, not worship ourselves. When a non-Christian psychotherapist urges a Christian client to acquire self-esteem, the therapist is barking up the wrong tree. She would be more successful speaking to the client about how God values the client.

While popular psychology speaks of self-esteem, Christians speak of Christ crucified.

They are parallel statements. Why? Because “Christ crucified” implies he died for me. Therefore, I am valuable. The implication is that if Jesus had not been crucified for my sake, then I would have no value, because I would be a sinner with no foundation for being forgiven by God. But since Christ was crucified in place of me, my worthlessness doesn’t count, and God loves me without reservation, as if I were Jesus Christ himself. Not only is self-esteem otherwise absent from the Bible, the Bible is the most realistic description of humans acting horribly that has ever been written.

Another difference between the Bible and popular psychology is that individualism is almost entirely absent from the Bible. The Bible thinks of people socially, as members of a church, family, or nation. The community is the central focus; individuals are important as they serve the needs of a community.

When we compare an individualistic (i.e., popular psychology today) with a God-and-community (i.e., biblical) view of humans, different things are emphasized. The individualistic approach values breaking rules, refusing to submit to authority, being unique. The God-and-community approach emphasizes obedience to rules, submitting to authority, and loving God and neighbor as much as you love yourself. The individualistic view emphasizes authenticity and honesty, but the Bible encourages you to control your tongue (James 1:26; 3:3–12). The Bible values humility and seeing yourself as small in the larger scheme of things. Popular psychology cannot comprehend that idea. When others are obnoxious, popular psychology tends to hold grudges and resentments. The Bible demands that we forgive our enemies, just as God previously forgave us even though we didn’t deserve it. This implies that when you are married to someone obnoxious, you should forgive and reconcile with your spouse.

The Bible’s Story

Every day the news media report disasters. What sort of a world do we live in? Is this an evil place? The Bible’s view is that the world is primarily

good, for God created it (Genesis 1). But then humans rebelled (Genesis 3). Things have been a mess since people arrived.

The story of the Bible, starting in Genesis 12, is how the hero of the Bible (God) sets about to rescue people, and also the environment, from disaster. People are at war with God. The central problem is how God can love people who are vicious both to God and to God’s representatives (those people who are powerless). God offers a series of peace treaties (called “covenants”), which say, in effect, “If you follow these simple rules, then I will bless you; but if you violate them, I will curse you.” The Ten Commandments are such a covenant (Exodus 20, Deuteronomy 5). People violated the Commandments, so God destroyed the nation Israel in the year 587 BCE.

The last peace treaty in the Christian view is based on Jesus’ blood. God offers to be at peace with people provided they made a decision to believe that Jesus had died for their sake. The Bible promises an experience of “the peace of God, which surpasses all understanding” (Philippians 4:7). The blessings and the curses attached to this treaty are more severe than to the Ten Commandments. The blessing is that if you accept the terms (i.e., belief in Jesus), then you would have eternal life, which is a quality of everyday experience, and also a promise after death. But the curse is that if you reject Jesus, then you are choosing to remain at war with God, so you will suffer an embattled life now and misery after death.

A person without faith usually lacks motivation or interest in the God of the Bible. Some people, upon hearing about this God, find the biblical story repulsive. Others make a decision to become part of the biblical story. At that moment, God comes into the person’s heart and fills it with an awesome experience of new energy. Suddenly there is peace with God; the antagonism of life vanishes. This does not mean that the believer is a perfect person. It means that God treats the person generously and is now responsive and available. From then on the believer has a psychological problem: whether to indulge in the old worldly lifestyle or stick to the new lifestyle described in Matthew 5–7. Experience shows that the new lifestyle is more rewarding. Over

decades, there is slow progress of the good gaining more influence. But by the time of death, the believer is still a thousand miles from perfection. The believer approaches death with confident anticipation.

Biofeedback: An Experience of Resonance

Dan Haldeman
Department of Integral-Transpersonal
Psychology, California Institute of Integral
Studies, San Francisco, CA, USA

Introduction

One of the main protocols in the rapidly evolving field of Mind-Body Medicine (MBM) is EEG (electroencephalogram) Biofeedback. Biofeedback uses technology to provide a client

with needed information about psychological states and physiological states (muscle tension, galvanic skin temperature, and brain waves) in an attempt to mitigate the effects of these physiological/psychological states. This interdisciplinary paradigm was introduced to the US medical community in 1969 as a way of giving humans more control over their physiology and consciousness, making the connecting links between physiology and psychology more apparent and accessible.

Soma/Psyche or Psyche/Soma

The development of Somatic Therapy has been attributed to the German psychiatrist Wilhelm Reich, who in the later stages of the 1800s while treating cancer clients with low voltage electrical currents, discovered that after passing a low voltage current through cancerous tissue to his amazement the cancerous growths were retarded and areas of psychosomatic issues were brought forward in his client's testimonies. Reich subsequently brought his research protocols to the United States, continuing his work into the 1900s where other researchers expanded on his protocols for somatic therapy as a cornerstone for Mind-Body Medicine as witnessed today (Cortwright 2007).

One of the main protocols used in mind-body medicine is EEG (electroencephalogram) biofeedback. Biofeedback machines measure EMF (electro-magnetic frequency). These EMF values are seen as an individual's resident frequencies since they are measured from the existing polarity found in their biological field. All plants, animals, and humans irradiate with EMF. When a person is scanned by a biofeedback machine, their resident frequencies are fed back to them in amplified form. This multiplied effect has been found to be very useful in treating illnesses that are based in addiction or allergy, and in this sense feeding back personal EMF is found to be an aid in reestablishing physical, mental, and emotional balance (Schmidt 2012).

Biofeedback operates according to a very basic principle of communication theory: in order to

effectively communicate information the sender and the receiver must be *tuned* to each other. This tuning or *resonance* occurs when one component of a person's EMF signal is measured quantitatively and then fed back overlaid with their actual biofield signal, resulting in a resonance between sender and receiver, meaning both are vibrating at the same frequency. The resonance experience has been found to be relaxing and uplifting, as well as being a foundation for a new experience of self as energy, a psychological state of consciousness felt as different from mind-body states associated with self (Schmidt 2012). Dr. Charles Tart has noted that the study of these psychological states is part of what he refers to as *state specific science* (Tart 1975).

Being Tuned In

Resonance can be seen as the heart of biofeedback and also as one of the foundational pillars of Humanistic-existential and Gestalt psychology (May et al. 1958; Perls et al. 1951). Researchers in these fields added to Reich's findings showing that in client's presenting with psychosomatic complaints positive outcomes can result by regulating affect through body work. More recent research in this area can be found in Gendlin's approach *Focusing* (Gendlin 1981) and Lowen with his *Bio-energetics* (Lowen 1975) and *Hemi-sync* auditory guidance system, Monroe (1975). One of somatic therapy's main contributions to mind-body medicine is the finding that psychological trauma causes deficits in the mind-body structure which often manifests in dissociative mental attitudes that disconnect from sensory input. Therefore, grounding clients in the present moment can allow healing to proceed (Cortright 2007).

Biofeedback aids participant's in experiencing their whole being by bringing their awareness into the present moment strengthening connections between mind, body, and heart. This process of *integrating* mind, body, and heart constitutes the awakening of spirit through the development of soul (Sri Aurobindo 1990). In this sense, biofeedback is construed as a spiritual healing intervention since it can increase a participant's awareness

of their energy and the possibility of transforming energy as an aid to counteracting their perceived illness/psychopathology.

Biofeedback used to open a person's spirit is not the only application being employed today. Following along traditional psychological approaches which Worthington (1982) noted epistemologically, four psychological domains are historically identified: psychoanalytic, behavioral, humanistic, and transpersonal.

Behavioral psychology uses biofeedback as a behavioral tool to change behavior very much in the tradition of B.F. Skinner's *Operant Conditioning* (Skinner 1948). Referred to as Neural Feedback, one goal here is to moderate brain waves, Alpha, Beta, and Theta, with the set goal of linking psychopathology to desired brain wave settings. Theoretically, by training the brain to regulate Alpha, Beta, and Theta psychopathology can be reduced. For further information about neural feedback and its effects on psychopathology please see: (Egner and Gruzelier 2004; Fehmi 2007; Shin 2004; Sokhadze 2007; Raymond 2005; (Gruzelier 2006; Walker 2004; Hammond 2001, 2006; Budzinski 1996; McKnight 2001; Norris 1998; Gluck 1975; Pelletier 1997; Lubar 1997).

Conclusion

Some clinicians in the EEG Biofeedback field (Peper 1996; Kamiya 1969; Kall 1994) have expressed concern that biofeedback as a tool for opening spirit and promoting human potential is being diverted from this intention by its application of neural feedback as a behavioral change tool. This argument follows the already well noted discussion of the differences and benefits between behavioral approaches and transpersonal approaches. Nonetheless, EEG biofeedback is expanding our understanding of the relationship of mind, body, and spirit.

Bion, Wilfred Ruprecht, and "O"

John Eric Killinger
The Intermundia Press, LLC, Warrenton,
VA, USA

Speaking of "O"

In seeking to formulate a general theory of the internal object, the British psychoanalyst Wilfred Ruprecht Bion (1897–1979) developed an epistemological understanding of the absolute truth *in* and *of* any object. This absolute truth he called

O. While O cannot be known, it can be known about – even its presence can be recognized and felt as, for example, in the Zen or Archimedean experience of eureka. But O itself is unknowable.

Knowledge respectfully leads to the indescribable ultimate reality, godhead, or "O," but the two concepts are not synonymous. Mathematically, Bion might have written this as $K \rightarrow O$, not $K = O$, for $K \neq O$. Transformations occur *in* or *under* "O," the godhead rather than *imago dei* or God, for both *imago dei* and God are imbued with activity, while the godhead is irreducible to operations. K, which stands for knowledge, is usually referred to by Bion as "curiosity." Bion often quoted a statement of French author and critic Maurice Blanchot (given him by André Green) – *La réponse est le malheur de la question* (Blanchot 1969, p. 13) – translating it as "the answer is the dis-ease of curiosity." This is a key feature in understanding that we must allow for possibilities and not close off the realm of the imaginal, especially the Void and formless infinite that is another way of referring to O. To kill curiosity is simplicity itself: just stuff an answer down a person's throat. If curiosity is flattened, then mystery dies with it.

In another paper, Bion (1957/ 1984) points out the movement that ensues from attempting to extinguish curiosity from life. When this occurs, the death of curiosity leads to arrogance, and arrogance is on the road to stupidity. The bumper stickers that proclaim Jesus as *La réponse* express an attitude of "I know," which indicates the inhibition and prohibition of the occurrence of possibilities. If such an attitude prevails, curiosity becomes not unlike the image of the crucifixion of Jesus as, for example, Matthias Grünewald imagined and painted him, who stretched out in his agony, which assumes the leprosy of the marginalized. When curiosity begins breeding *scintillae*, or soul sparks, we ought to be fanning them into flame rather than trying to stamp them out because of their seeming irrationality.

Mental pain is thus necessary to sustain the dynamism within the analytic encounter so as to make possible and foster development. By mental pain, which the patient (and analyst!) must come to tolerate, is meant a link to transformation in K –

knowledge/curiosity – that leads to transformation in O and the passing through of resistance (psychological turbulence), which can be written $TK \rightarrow TO$. Psychological turbulence is resistance to an interpretation that moves one from the comfort zone of "knowledge about" to a less comfortable one of "becoming being" because O is equated with the Void and formless infinite. As with Jung's notion of individuation, this passage is not a once-for-all event but a process. The mental pain comes about because most people prefer the "knowing about" to "being" or "becoming *being*." This is comparable to William Sheldon's understanding that most people are comfortable/content with repression (the "dying back of the brain") rather than soul making.

Speaking of O is not unlike attempting to define the Tetragrammaton, יהוה (YHWH), in which the vowels are left out of the name of the godhead because it is a way of talking about a force or power that cannot be described in articulate speech appropriate when discussing omnipotence, omniscience, or other formulations of religion.

Bion's Lateral Move

Essentially what Bion does is begin with Plato's theory of Forms to anchor the significance of O. Transformations of phenomena into representations of what once was but is/are no longer known are representations of a person's experience of O. This gives the transformations themselves an anamnestic quality, that is, they serve to remind or help us forget what has been repressed.

The lateral move that Bion makes is from Platonic Forms to the doctrine of Incarnation as expressed by the so-called Rhineland mystics Meister Eckhart and Doctor Admirabilis, John (Jan) van Ruusbroec. O is not 0 (zero). O is unknown ultimate reality. O is whole. The desire to be either completely good (the absence of evil) or completely evil (the absence of good) does a disservice to O, for O is *being*, the thing-in-itself. To be either good or evil is to be forever split, which is not in accord to being O or even attaining at-one-ment with it.

O is analogous to Meister Eckhart's prayer, "I pray God to rid me of god" (Eckhart 1941, p. 231), an invocation of emptiness that allows one to be filled with the godheadness of the godhead. The capitalization and lower case usage of "God" and "god," respectively, in this translation is explained by Eckhart's reading of the *Timaeus* of Plato. Ruusbroec describes a movement from union through an intermediary (God's grace + one's holy way of life) through union without intermediary (bare and imageless understanding, i.e., the abyss) to union without difference (the dark stillness which always stands empty out of which all things come [*tohuwabohu*, *abaissement de niveau mental* (!)], superessential to us and essential to God). It is a good demonstration of Bion's epistemological movement of transformations of curiosity to transformations of unknowable ultimate reality, or $TK \rightarrow TO$. Distilled from the thinking of these medieval mystics, O as a function of knowledge that emanates from being without implying action in the world does so without preconceptions, foreknowledge, even identification, for doing so would put distance between O and the person. We can be O but we cannot identify with O. Qualities attributed to O are links to O (such as love, hate, and knowledge [curiosity]), and these qualities or links are but substitutes for and approximations of O. These links are inappropriate to O; however, they are appropriate to transformations in (or under) O, written as TO. After enumerating several types of transformation, Bion raises the question:

It is possible through phenomena to be reminded of the "form." It is possible through "incarnation" to be united with a part, the incarnate part, of the Godhead. It is possible through hyperbole for the individual to deal with the real individual. Is it possible through psycho-analytic interpretation to effect a transition from knowing the phenomena if the real self to being the real self? (1965, p. 148).

What Is at Stake?

For Bion, what is at stake is this bit between, the gap betwixt what he terms "knowing about phenomena" and "being reality." For example, one could compare this to knowing about psychology

and being psychologized – experiencing the stirring of soul, its provocation, and the waking of the sleeping bear, which despite being quite wrong by standards of common sense is quite right in order to free the *dynamis* of *psyche* by means of provoking or sustaining mental pain. This is what leads to realizing transformations *in* or *under* O.

At-one-ment with O is possible, though it is not attainable through curiosity/knowledge (K). Curiosity depends upon the evolution of $O \rightarrow K$, which means ridding curiosity of memory and desire. So it would seem that to become one with O requires a transcendent position, and it is analogous to the Lacanian Real. Grotstein (1996/2000) notes that the letter *aleph* in Borges' story, "The Aleph," captures the essence of O. In the Hebrew alphabet, *aleph* as first letter represents a person reaching simultaneously toward the sky and toward the earth. As such, the *aleph* is the point at which all points converge. Regarding the story of Borges (1949/1998), a view of its shadow and a penumbra of associations is offered by Blanchot (1959/2003). In the Kabbalah, *aleph* is the *Ein Sof* or godhead. According to a story regarding the creation in *Sefer Zohar*, the blessed Holy One explains that despite creating the world through the second letter of the alphabet, a (*aleph*) is to be the first of all the letters, and only through *aleph* does the blessed Holy One become One. "No union," remarks the blessed Holy One, "is actualized except by a [*aleph*]" (Matt 2004, p. 16).

The change from curiosity to the unknowable ultimate reality ($K \rightarrow O$) is for Bion a special case of transformation, and he regards it as of particular concern to the analyst in "[their] function of aiding maturation of the personalities of [their] patients" (Bion 1965, p. 158). In such a transformation from description of action in the world to representation emanating from being, psychological turbulence, or resistance to interpretation, is bound to occur. Bion cites the third dark night of the soul from *The Ascent of Mt. Carmel* of St. John of the Cross. This transformation in O ($K \rightarrow O$) that involves becoming is felt as being inseparable from becoming ultimate reality. The dark night pain is, according to Bion, the fear of megalomania, and this fear inhibits acceptance of being responsible and/or mature because it has the

appearance of involving *being* God with the pain that can be expressed inadequately as megalomania (Bion 1965, p. 159).

Grotstein notes “The generally feared connotation of ‘mysticism’ has occurred through the projective identification of ‘mystique’ onto it by those who, according to Bion, are afraid of truth and so mystify its clarity” (1996/ 2000, p. 301). What is needed is to learn to see things as they really are, to see through the camouflage and deception of words and symbols.

Birgitta of Sweden

Pamela Cooper-White
Union Theological Seminary, New York,
NY, USA

The Catholic Christian Saint Birgitta (Birgitta Birgersdotter, Birgitta of Vadstena) is considered by many to be the foremost saint of Sweden. (Although her name is sometimes Anglicized as “Bridget,” she is not identified with either the Celtic goddess or the Irish saint.) She was born in 1303 to the Swedish knight Birger Persson, a wealthy landowner and governor, and his wife Ingeborg, a woman of royal blood. In her early teens, Birgitta was married to a nobleman, Ulf Gudmarsson, and bore eight children, including a daughter who would become St. Catherine of Sweden. Together the couple joined the Third Order of Franciscans. From childhood, Birgitta received mystical visions and felt deeply called to a missionary life of prophecy and piety. In 1341, after fulfilling a dutiful term in the court of her cousin, King Magnus Eriksson, she and Ulf made the popular pilgrimage to the grave of the Apostle James, Santiago de Compostela, in north-west Spain. The journey was arduous and took over 2 years to complete. Ulf became ill and died while being cared for at a Cistercian monastery at Alvastra, Sweden. While grieving Ulf's death, she received a vision in which God called her to be “My Bride and My mouthpiece.” By 1346, she felt called to create an ascetic religious community of her own at Vadstena, the Order of the Most Holy Savior (O.ss.S) or “Brigittines,” following the Rule of Augustine and including both women and men (in spite of significant opposition). Birgitta was not only mystically inclined but practical and effective as a leader. She won financial backing from Magnus Eriksson, and her order drew many adherents, eventually spreading to continental Europe and Britain (Fig. 1).

In the Jubilee Year 1350 Birgitta traveled to Rome to seek papal authorization for her order. The papacy was suffering its famous Schism or “Babylonian Captivity,” so she settled in Rome to

Birgitta of Sweden, Fig. 1 Birgitta of Sweden on an altarpiece in Salem church, Södermanland, Sweden (Public Domain http://en.wikipedia.org/wiki/File:Heliga_Birgitta_på_ett_altarskåp_i_Salems_kyrka_retouched.png)

wait – and to campaign for the return of the exiled Pope Clement VI from Avignon. Birgitta’s order was finally recognized after 20 years by Pope Urban V. Her reputation as a pious and godly woman continued to grow internationally, and she advised several intervening popes on the basis of her visions. After a final pilgrimage to Jerusalem, during which she survived a scandal involving one of her sons and the Queen of Naples, then the death of the same son from fever, plus a shipwreck off the coast of the Holy Land, she returned to Rome and died in 1373 at the age of 71. She was canonized in 1391 by Pope Boniface IX. Her relics are kept at Vadstena.

She is perhaps best known for her visions, recorded and translated into Latin as the *Revelationes Coelestes* (Celestial Revelations) by her confessor at Alvastra and another Canon of the church. These were widely circulated throughout Europe. Her depictions of the virgin kneeling in adoration before a brightly shining infant Jesus had a lasting influence on the iconography of the Nativity in medieval and Renaissance art. In another vision, Birgitta received 15 prayers

from Christ to be used to honor his wounds. These became known as the “Fifteen O’s,” as they all began with the words “O Jesu,” “O Rex,” or “O Domine Jesu Christe.” These also were widely disseminated and translated, and eventually set with late medieval rubrics promising indulgences and other benefits to both the living and the dead. For this reason, they fell out of favor during the Reformation, but shorn of their superstitious usage, they remain a testament to Birgitta’s fervent faith and lasting influence. The Brigittine order now spans the globe, with headquarters in both Rome and Vadstena.

Psychology

Birgitta is a strong figure of female authority, whose ego strength transcended the constraints of her patriarchal society. In object relations terms, her visions of Christ, Mary, and God provided her with strong internal objects, imagos, or mental representations which overrode numerous objections to her mysticism and piety coming from both family and church officials. From the perspective of Jungian depth psychology, such non-pathological visions from childhood may also be seen as archetypal images coming to ego-consciousness with mystical guidance from the divine Self. For example, her images of kneeling before Jesus symbolize her ego’s devotion to serve a transcendent sacred numinosity, which was then transmuted via action into an experience of the sacred for others.

Black Elk, also known as *Hehaka Sapa* (Brown 1953); Nicholas, baptismal name (Steltenkamp 1993); and Choice, Black Elk's boyhood name, *Kahnigapi* (Neihardt 1984), was born in December 1863 in a family of healers; his father and grandfather were prominent Oglala medicine men (DeMallie 1984, p. 3). He, too, was a powerful thunder medicine man, leading in

traditional (Yuwipi) ceremonies. As a *Heyoka* he worked with the thunder and dog medicines and, as such, often worked in paradoxical (contrary) ways. The *Heyoka* or thunder dreamers often do or say the opposite of the intended meaning. Black Elk actually practiced traditional healing and medicine throughout his life, converting to Catholicism only in 1929 when he married his first wife, Katie War Bonnet who was a Catholic. Black Elk's family believes that his "conversion" to Catholicism and his work as a catechist were not absolute. Family members recall that he continued to pray with the pipe, especially when the thunder beings came (during thunder and lightning storms), along with maintaining his Catholic practices (G. A. Looks Twice, 2007, personal communication). However, some family members report that Black Elk did not practice the traditional ceremonies after his conversion to Catholicism.

Black Elk as a Historical Figure

As a historical figure, he was remarkable in many ways. As a young man, he fought in the Battle of Greasy Grass (Little Bighorn) and traveled with Buffalo Bill's Wild West Show across the United States, performing at Madison Square Garden, and in Europe, including England, France, and Germany. He was actually left behind when the Wild West Show returned to America, and lived in Europe for a year, traveling across Europe. In a letter written in 1889, Black Elk commented that he wished he could have seen the land "where they killed Jesus. . ." but noted that it required "four days on the ocean and there was no railroad. [and] If horses go there they die of thirst. . ." nothing that "[It would require] much money . . ." (DeMallie 1984, p. 10). He was a survivor of the massacre that occurred at Wounded Knee in 1890. Black Elk survived three wives and fathered numerous progeny. He married Katie War Bonnet in 1892. He had three sons from this union, William (1893), John (1895), and Benjamin (1899), all baptized as Catholics. Katie died in 1903 and Black Elk was

baptized as a Catholic in 1904 and named “Nicholas Black Elk.” In 1906, he married Anna Brings White, a widow who had two daughters. He fathered three children from this union, Lucy (Looks Twice), Henry, and Nick, Jr. (Goins n.d.). Two of his grandchildren, George A. Looks Twice, 74, coauthor of this article, and Esther Black Elk DeSersa, 80, still live in the Pine Ridge Indian Reservation (Fig. 1).

There are also five other living grandchildren of Nicholas Black Elk Sr., whose father was Nicholas Jr. Nick Jr. was married to a Rosebud (Sicangu) woman by the name of Bertha Brings Three White Horses. Black Elk died in August 1950, at the ripe old age of 87.

Black Elk, Fig. 1 Photo shows Black Elk and his grandson, George Looks Twice (coauthor) at the summer Indian Pageant held in the Black Hills, Rapid City, South Dakota, during the 1930s. (Photo from Vern Ziebart’s collection, Rapid City, S.D.)

Black Elk as an Anthropological Informant

Most of what the non-Indian world has come to know of Black Elk has been through recorded or transcribed interviews about his vision talk and explanation of the rites of the Oglala that he gave to non-Indian partners whom he made his kinship relatives through formal (Hunka) adoption ceremonies. From 1931 to 1947, he shared different things about himself with each partner and relative. These interviews were given to John G. Neihardt (summer of 1931) and later published in *Black Elk Speaks* (1932) and *When the Tree Flowered* (1951). They focus on Black Elk’s pre-preservation experiences as a boy and young man and his lifelong struggle with the major vision which he carried with him with much sadness and regret. Neihardt based these books on material gathered from three visits to Black Elk. Later, Black Elk shared extensive information about the rites of the Oglala with Joseph Epes Brown who published *The Sacred Pipe: Black Elk’s Account of the Seven Rites of the Oglala Sioux* (1953). Brown actually lived with Black Elk and his family for almost a year, during which time he became a part of Black Elk’s family.

Black Elk as a Transformational Leader

It is difficult, if not impossible, for the non-Indian unfamiliar with reservation life to comprehend Black Elk. Recall the two extensive works (Brown 1953; Neihardt 1932) written about him, which chronicle about 20 years of his life – mostly his pre-reservation experiences, “the way things used to be for the Lakota. . .” This leaves approximately 67 years unaccounted for, which leads us to consider the third source of information about this important figure in the history of religion and cultural studies. This source is Lucy Looks Twice, Black Elk’s daughter, who shared her perspective on her father with Michael F. Steltenkamp, who at the time was a teacher at the Red Cloud Indian High School (1993) on the Pine Ridge Indian Reservation. This perspective on Black Elk paints a different image of him from the earlier sources

(Neihardt 1932, 1951 and Epes Brown, 1953) in that it looks at the previously unrecorded years of Black Elk's life, when he was known for his tireless catechetical work with the Jesuit missionaries. As Steltenkamp talked to people in Black Elk's home community, he realized that while few people even knew about the books written about the man, everyone knew Nick Black Elk for his sense of humor and his dedication and skill in teaching Catholic doctrine to children, as well as his kindness and tireless service to his community (Steltenkamp, 8 February 2007, personal communication; see also Steltenkamp 1993).

Steltenkamp felt that Neihardt had misunderstood Black Elk to some extent and missed some of the humor in Black Elk's interviews. One example was where in *Black Elk Speaks*, where Nick Black Elk talked about escaping Wounded Knee, commenting that "We were very hungry because we had not eaten anything since early morning, so we peeped into the tepees until we saw where there was a pot with papa (dried meat)..." While eating the papa, they came under fire by the soldiers; he noted that they "kept right on eating until we had our fill. Then we took the babies and got on our horses and rode away. If that bullet had only killed me, then I could have died with papa in my mouth..." (Neihardt 1961, p. 270). While Neihardt viewed this comment with a deep sense of sadness and loss, Steltenkamp noted that this was a good example of Nick Black Elk's wry humor... comparable to the warning many mothers give to their children to always wear clean socks... "you never know when you might be in an auto accident [and you don't want to be found wearing dirty socks when you go to the hospital]." There was also a striking sense of defiance – in that even while under fire, the young Black Elk and his friend eat their fill of the papa. Steltenkamp felt that Neihardt missed the essence of Black Elk's humorous style.

Decolonizing Black Elk's Legacy

Of course, there has been considerable debate as to "Who is the real Black Elk?" We see the

traditional Oglala holy man; the brave, self-sacrificing warrior who resisted, fought, and survived the massacre at Wounded Knee in 1890; the witness of the traumatic events during the transition of the plains Oglala Lakota to reservation life; a devout Roman Catholic catechist; and the archetypal image of the plains Indian portrayed to tourists visiting the old Indian village during the 1930s (Fig. 2).

Clearly, Black Elk is a complex figure who defies simple categorization. The second author, Georgine Looks Twice, believes that Black Elk's "conversion" to Catholicism was due in part to his sadness toward his vision but also a way to protect the rituals and traditions that at that time and space were banned by the US Government (Indian Offenses Act, in Lame Deer 1992, p. 230).

To Black Elk's descendants, Black Elk's conversion to Roman Catholicism was also a survival

Black Elk, Fig. 2 Photo shows Black Elk poring in full regalia at the summer Indian Pageant held in the Black Hills, Rapid City, South Dakota, during the 1930s. (Photo from Vern Ziebart's collection, Rapid City, S.D.)

strategy (Georgine Looks Twice, 17 February 2008, personal communication; see also Lone Hill 2008). Converting to Catholicism during the early reservation era enabled Black Elk to assert leadership in his community during a very tumultuous period of history for the Lakota people. Black Elk's great granddaughter (and coauthor) believes that Black Elk's compliance with the Catholic missionaries was his response to the oppression that was part and parcel of reservation life. Black Elk discovered a way to transform the broader and pervasive oppression into personal and spiritual transformation, enabling his people to better understand their new situation while holding on to traditional values.

The process of understanding Black Elk is like setting up a traditional 3-pole Lakota tipi – each pole a different informant – Neihardt, Brown, and Steltenkamp. While setting up the tipi may seem simple at first glance, it is much more complex and elegant than someone inexperienced with the process might realize. The foundation of the traditional Lakota tipi are three poles laced in such a way that two of the poles can be pulled apart to form the inverted V shape, with the third forward pole serving as the lifting pole, which actually raises the tipi – this can all be done by one person which is quite remarkable considering that each pole is approximately 20–26 ft high and may weigh as much as 50–60 lb each. After the foundation tripod has been set, the remaining poles are lashed under each of the three foundation poles, which, when finished, forms an elegant spiral when looking up at the poles from inside the center of the tipi. Of course, invariably there are inexperienced people trying to set up a tipi. They generally yell instructions to one another, maybe become so frustrated they may even give up. Most of the times, the end result of their effort is usually a disaster – or at least a very wobbly tipi that will blow away in the strong prairie winds. For many non-Lakotas, attempting to understand Black Elk is like this.

Black Madonna

Vivianne Crowley

Cherry Hill Seminary, Columbia, SC, USA

Department of Psychology, Nottingham Trent University, Nottingham, UK

Black Madonna is a term used to describe statues and icons of the Virgin Mary where she is depicted as brown or black skinned. The images usually show the Madonna with the child Jesus, who may be depicted as black or white. The images are found predominantly in Europe or in countries with a European colonial past. Some images have European features, but African featured Black Madonna statues have been present in Europe from at least the twelfth-century CE and were probably made originally for African Christian churches. Interpretations of the origins of the images are complicated because some existing images are replacements for earlier Madonnas stolen or destroyed through wars, the Protestant Reformation, the Catholic seventeenth-century Counter-Reformation, the eighteenth-century French Revolution, or simply through changing artistic tastes. Black Madonnas are relatively rare, but those that survive are highly popular and are celebrated by large pilgrimages and major festivals (Crowley 2001).

Black Madonnas and their cults have been analyzed from different disciplinary perspectives, including history, iconography, theology, religious studies, folklore, anthropology, cultural studies, gender studies, sociology, and psychology. In the English-speaking world, interest in Black Madonnas was kindled in the 1950s by an influential paper given by cultural anthropologist Leonard Moss to the American Association for the Advancement of Science (Moss and Cappannari 1953). Moss, who first encountered a Black Madonna as a Second World War soldier in Italy, proposed a threefold classification of the images: images made to represent the indigenous population, African or other dark-skinned images venerated by largely white populations, and accidentally black Madonnas – those made from dark wood or pigments that had darkened with age.

The anomaly of Black Madonna statues in largely white Europe has led to speculation that their origins may lie in earlier pre-Christian goddess cults (Saillens 1945). German folklorist Jakob Grimm was one of the first scholars to make connections between Black Madonnas and pre-Christian goddesses known to have had black images, including Demeter, Persephone, and Aphrodite, concluding that in Black Madonnas, “the Holy Virgin appears then as a mourning goddess of the earth or the night” (Grimm 1835/1882, pp. 313, fn. 1). More recently, theories about the origins of Black Madonnas have focused on the marginalized figure of Mary Magdalene, arguing that some Black Madonnas represent the “other Mary” rather than the Virgin Mother. These theories have proliferated following the publication of *The Holy Blood and the Holy Grail* (Baigent et al. 1982), claiming that Mary Magdalene was the wife of Jesus, and the elaboration of this theme in popular fiction.

Black Madonnas as Popular Religion

Black Madonna cults often start as popular religion, “in spaces that emerge from and communicate with orthodox patriarchal hierarchies, but yet remain set slightly apart” (Hall 1997). In medieval Europe, peasant populations who worked the fields had darker skins than the ruling elites and identified with the Black Madonna, as did the Roma or Gypsies, a marginalized group of Indian origin. Black Madonna shrines were often situated outdoors in forests, mountains, or other natural areas. If the cult became popular and was drawing revenue and prestige away from mainstream churches and monasteries, there might be moves by church authorities to suppress it. If these were unsuccessful, cults were absorbed and regulated by relocating them within a church, but in some instances, the status of the cult remained ambivalent. The shrine of Our Lady of the Willow Grove, the Black Madonna of Guingamp in France, for example, was placed in a church north porch rather than inside the building, and her feast day was marked until the nineteenth

century by “excess” and “orgies” (Cassagnes-Brouquet 2000, p. 179).

Jungian Interpretations of Black Madonnas

Carl Jung’s analytical psychology emphasized the importance of the psychological impact of images and symbols and gave rise to new psychological interpretations of female divine and quasi-divine images. Jung’s theories about the relationship between the feminine, the Divine Feminine, goddesses, and the *anima*, the internalized feminine in the male psyche, influenced Jungian analyst Ean Begg’s formative book *The Cult of the Black Virgin* (Begg 1985/1996) and subsequent Jungian writers, male and female. For Begg, a white male, the Black Madonna is doubly “other,” a powerful, numinous exemplar representing not only the suppressed feminine divine but also, echoing Grimm, that which is dark, forbidden, and unconscious and has associations with death and the element of earth:

Our ancient, battered, much loved, little understood Black Virgins are a still-living archetypal image that lies at the heart of our civilization and has a message for us. The feminine principle is not a theory but real and it has a will of its own which we ignore at our peril. It is an independent principle and cannot be forced against its will to go anywhere or do anything without bringing retribution on the perpetrator. (Begg 1985/1996, p. 134)

Other Jungians have taken similar view, and Black Madonnas are credited with Jungian notions of “the feminine,” such as healing, intuition, and deep connection with nature. Analysts Anne Baring and Jules Cashford accept uncritically the idea that Black Madonnas embody “the ageless Wisdom of an invisible dimension hidden within the outward form of nature . . . the fathomless mystery of the soul” (Baring and Cashford 1991, p. 647). Similarly, for therapist Lillian Comas-Díaz in *Our Inner Black Madonna: Reclaiming Sexuality, Embodying Sacredness*, the Black Madonna represents remnants of “ancient goddess worship syncretized into Christianity,” and despite the Virgin Mary’s traditional lack of any sexual experience, a Madonna that is

black represents female sexuality and the fecundity of rich dark soil (Comas-Díaz 2008).

Critics of Jungian psychology argue that Jung’s theories reduce disparate religious symbols to underlying archetypes that encourage interpretations that are acultural, ahistoric, and largely divorced from the beliefs and feelings of the original devotees. Interpretations of the meaning of Black Madonnas often reflect projections, some of which may be, as Professor of Religion Cynthia Eller points out, unconsciously racist. Eller criticizes interpretations of the Black Madonna that conflate her into a “Dark Goddess” or “Dark Mother” figure that “does not exist cross-culturally but is rather the joint creation of the history of religions, Jungian psychology and spiritual feminist ingenuity” and represents a fusion of “Hindu, African and Christian sources, with a uniquely fraught mix of longing, envy, hope, fear and guilt.” (Eller 2000).

Black Madonnas and Postmodern Spirituality

Despite the flaws of a Jungian approach, it can resonate well with contemporary post-Christian spirituality, which is characterized by a postmodern *bricolage*, in which spiritual seekers combine their own selection of symbols and practices, drawing comfortably from different and sometimes competing old and new religious traditions. As well as the Catholic faithful, pilgrimages to Black Madonna shrines are drawing new generations of international pilgrims, who may not identify as Christian but can find psychological meaning in the Black Madonna as an archetypal goddess. Anthropologist Anna Fedele notes from fieldwork carried out when accompanying such pilgrimage groups to Black Madonna shrines that in order to deal with daily problems and past pain, the pilgrims had created their own personal transnational and transhistorical spirituality that divorces the Black Madonna from any particular religion, historical period, or nation. Influenced by discourses drawn from Jungian psychology, Anna Fedele notes that women experienced the Black Madonna as the “dark side of the Feminine”

repressed by patriarchal organized religions. “In effect, a Christian-Pagan divinity emerged that allowed the pilgrims to express a sense of alienation about deep-seated problems related to sexuality” (Fedele 2013).

Black Madonnas: Race and Empowerment

White interpretations of the Black Madonna often fail to consider that the reactions of a white spiritual seeker, for whom a dark-skinned venerated female figure is different, mysterious, and “other,” are different from the responses of a dark-skinned Catholic woman, for whom the Black Madonna is not “different from” but “alike to.” Broadcaster and writer Bonnie Greer, for example, has commented on how empowering and moving it was to discover Black Virgin images, having been accustomed to White Virgin Madonnas throughout her Catholic education in the United States (Greer 2001). For a Christian woman of color, a Black Madonna image can be the first positive religious image with which she can personally identify, especially as the color black has had associations in Catholic cultures with evil, the occult, and sin (Boss 2007). Marina Warner comments in her book on the Virgin Mary *Alone of All Her Sex*, for example, that in Catholic countries, blackness is associated with devils, not angels (Warner 1976/2000, p. 275). Positive associations of goodness with Black Madonnas are therefore inherently countercultural and challenge stereotypes of white being the color of purity, goodness, and power.

Colonial Catholicism spread Black Madonna cults by creating replicas of Black Madonnas from Europe and new images. In new Christian countries, converts welcomed a Mary that looked like the indigenous population. Black Madonnas also served other cultural functions. In the Caribbean and the Americas, Black Madonna cults incorporated goddess beliefs and practice from African and indigenous traditions and became vehicles for the transmission of suppressed culture. Elizabeth Perez notes, for example, that the Cuban cult of the Virgin of Regla “rather than assisting Roman

Catholicism in the obliteration of African-derived religious forms . . . helped to sustain their practice” (Perez 2010).

The Reverend Godfrey Chigumira argues how in an African context the Virgin Mary, as a strong woman who experienced poverty, suffering, flight, and exile, can be viewed as a radical “game changer,” “an autonomous, independent, and active heroine for social justice” who “stands up for the poor and oppressed” (Chigumira 2014). Chigumira notes how to her devotees the Black Madonna’s image is that of “an adult woman, a powerful character, not to be sidelined, an untamed revolutionary” and comments on the importance of Laurence Vincent Scully’s painting of the Black Madonna of Soweto as a rallying symbol in the anti-apartheid struggle.

Recent ethnographic research has brought to the study of Black Madonnas a greater interracial sensitivity that by giving voice to the Madonna’s principal worshippers aims to elucidate contemporary spiritual practice, while accommodating new and diverse understandings of the veneration of Black Madonnas (Crowley 2015).

Blackfoot Nation

Kenneth H. Lokensgard

The Department of Religious Studies, University of North Carolina-Chapel Hill, Chapel Hill, NC, USA

The Blackfoot Nation is a confederacy of four closely related and allied culture groups, belonging to the Algonquian language family. Historically, the Blackfeet inhabited the northwestern plains of North America. Their territory stretched

east from the Rocky Mountains to the Great Sand Hills on the present-day Saskatchewan/Alberta border and south from the North Saskatchewan River in Alberta to the Yellowstone River in Montana. Today, three groups – the Apatohsippiikanis, the Kainais, and the Siksikas – have individual reserves in Alberta, Canada. The fourth group – the Aamskaapiikannis – are located in the USA, on the Blackfeet Reservation in Montana. The reservation and reserves are all located within the much greater, historical Blackfoot territory. While many types of Christianity have been introduced to the Blackfeet, some continue to practice their traditional religion. The Blackfoot religion is centered upon maintaining mutually beneficial relations between the Blackfeet and the other inhabitants of the environment. In recent years, it has been adapted to address contemporary challenges and concerns (Fig. 1).

The Blackfeet refer to themselves as the *Niitsitapiiksi* or “Real Persons.” The notion of personhood is central to their traditional identities and to their understanding of the world. Persons (*matapiiksi*), to them, are beings who are capable of interacting socially and who do so with an understanding that their actions affect others. Thus, the Blackfeet who practice their traditional religion believe that “real” or true persons are those beings who engage consciously in reciprocity.

Importantly, traditional Blackfeet consider many beings besides humans as persons. This fact is reflected in their language. As psychological anthropologist A. Irving Hallowell (1975) first demonstrated to scholars, it is actually reflected in the languages of all peoples in the Algonquian language family. In the Algonquian languages, there is no gender designation of male, female, or neuter. Rather, there is a designation of animate or inanimate. The former category includes many things that most non-Indians might not even consider alive.

According to the Blackfoot worldview, each animate thing or being belongs to one of three categories: Above Persons (high-flying birds, stars, etc.), Earth Persons (low-flying birds, most four-legged animals), and Underwater Persons (aquatic and riparian animals). Regardless of

Blackfoot Nation,

B

their categorization, all beings have been animated and given the potential for personhood by *Ihtsipaitapiyo'pa* (“The Source of our Life”). Sun, an Above Person, is the primary manifestation of the Source.

Hence, in the Blackfoot world, social interaction can extend beyond the realm of humanity. Moreover, because their world is inhabited so densely by human and other-than-human persons, practicing reciprocity is imperative. Traditional Blackfeet want their actions to elicit positive reactions from the beings around them rather than negative reactions. Their religion thus highlights generosity, respect, and exchange (Lokensgard 2010).

Psychologist Abraham Maslow spent 6 weeks on the Siksika Reserve. His observation of the *Siksikas* influenced the development of his “hierarchy of needs” theory. These needs are, from basic to most advanced, physiological, safety, belongingness and love, esteem, and self-actualization (Maslow 1987). Maslow’s idea of the “self-actualized” person – a person who is in “good psychological health,” whose “basics needs are satisfied,” and who devotes herself or himself to pursuits that are “intrinsically worthwhile” – was embodied by the majority of the *Siksikas* he met (Blood and Heavyhead 2007; Maslow 1972, p. 192; Maslow 1987, pp. 15–22). He felt, on the other hand, that self-actualized individuals were rare in mainstream North American society. This

is because, he argued, the basic needs in his hierarchy were easily provided for in traditional Blackfoot society, where familial relations are highly esteemed and regarded as the model reciprocal relationships. In other words, he felt that the practices of generosity and respect, which result from the Blackfoot emphases upon reciprocity and caring for others as if they were family, lessened the sort of aggressive competition for status found in other societies (Blood and Heavyhead 2007; Maslow 1972, pp. 201–204, 228).

When Maslow visited the *Siksika*, the Blackfeet, as a whole, were experiencing pressure to give up their traditional religion for Christianity. Also, at the insistence of Canadian and US government agents, they were beginning to turn toward ranching, farming, and commodity foods for sustenance. This means that traditional Blackfoot culture was beginning to weaken (Lokensgard 2010, pp. 115–120). Today, poverty, broken families, alcoholism and drug addiction, and numerous other social problems plague the Montana reservation and Canadian reserves.

Since the late 1970s, however, traditional Blackfoot culture has been going through a period of revitalization. Blackfeet are adapting it to address contemporary social challenges and concerns (Lokensgard 2010, pp. 135–152). Those who are now returning to the traditional religion often come from troubled families or from troubled

personal pasts. It is common for individuals in need of medical help – mental or otherwise – to attend the major ceremonies that are held during each season.

These seasonal ceremonies are the Beaver Bundle ceremony, held each fall and spring; the Thunder Medicine Pipe ceremony, held each spring; the Sun Dance and related ceremonies, held each summer; and the All Smoking ceremony, held in the winter (Lokensgard 2010, pp. 92–103). During the bundle ceremonies, traditionalists renew mutually beneficial relations with certain other-than-human persons who help them lead successful lives. These other-than-human persons, especially animals, are made present at the ceremonies through their physical “bodies” (skins, rocks, etc.). These living bodies are the primary contents of the bundles (Lokensgard 2010; Wissler 1912).

During the Sun Dance, many traditionalists come together to form a strong sense of community with each other and with the other-than-human persons. Some Blackfeet also make physical sacrifices. They do so to express thanks for help received from others, particularly *Ihtsipaitapiyo’pa*, or to elicit help that will be needed in the future. The physical sacrifices can range from merely sacrificing ones’ comfort, through fasting and/or sweating in “sweat lodges,” to the offering of one’s skin. Historically, the Blackfeet would typically offer pieces of flesh from their forearms. Now, some Sun Dance participants pierce their flesh, use these piercings to bind themselves to a post, and dance until the piercings break free from their skin. This practice may have been introduced by the unrelated Lakotas (“Sioux”), but some Blackfeet contend that piercing predates the late 1800s, when the Blackfeet and Lakota began to have friendly interactions (prior to this era, they were often at war). Regardless, both types of physical sacrifice follow the logic that humans benefit from displays of respect and generosity directed toward fellow humans, “other-than-human” persons, and The Source of our Life (Lokensgard 2010, pp. 99–101; Wissler 1918).

The fourth seasonal ceremony, the All Smoking ceremony, serves to affirm the credentials of religious leaders. These leaders are people who have achieved and maintained

relationships with a large number of other-than-human persons, through the care of bundles and mastery of other ceremonies. Religious “elders” are, specifically, those who have seen their ceremonial bundles and/or knowledge passed to a second and third person or married couple (many bundles must be cared for by a husband/wife team). They are spiritual “grandparents” or elders to the third generation of ceremonialists caring for the bundles or knowledge that they passed along earlier.

Many people make spiritual vows to participate in bundle ceremonies. Like most participants in the Sun Dance, these people want to request help from the other-than-human beings and the Source or give thanks for help already received. Often, those who make vows are experiencing great medical or other hardships. Usually, they have already seen the non-Indian medical professionals who specialize in addressing their problems. Of course, their participation in seasonal ceremonies requires a display of generosity to the ceremonial leaders and to the other-than-human persons who are being honored; those fulfilling vows must offer food, blankets, and/or tobacco during ceremonies. Ceremonial leaders receive these gifts on behalf of the other-than-human persons and redistribute them to the human attendees. This process demonstrates the commitment to reciprocity that all “Real Persons” should show, if they expect help and kindness from others (Lokensgard 2010).

Narcisse Blood and Ryan Heavyhead of the Kainai Studies Department at Red Crow College (on the Kainai Reserve) are strong advocates of the traditional Blackfoot religion. They have also researched the influence that the Blackfeet had upon Maslow. They argue that he overlooked the importance of “place” to the Siksikas (Blood and Heavyhead 2007). They suggest that he met so many people that seemed self-actualized, not simply because of the pervasive emphasis upon reciprocity in Blackfoot society but also because reciprocal behaviors are extended to include beings beyond the human society. This means that the Blackfeet gain even more allies in their quests for healthy, successful lives, and it also reinforces the spirit of humility that accompanies the emphasis upon reciprocity.

Therefore, Heavyhead and other educators in Blackfoot Country insist that young Blackfeet should set aside their electronic devices and get to know the inhabitants of the wider, spiritual world. Still, even Heavyhead would not deny that living generously and respectfully toward others could benefit *anyone*, whether they live in a highly animate world, like the Blackfoot one, or not.

Kainai scholar Betty Bastien (2004) is also a strong advocate of Blackfoot religion. She suggests that it can help contemporary Blackfeet overcome the colonial mindset that has resulted from the Euro-American style of education that has been imposed upon them since the late 1800s, when the reservation and reserve era occurred. Bastien suggests this mindset is characterized by a “dissociative and objectifying epistemology” (Bastien 2004, p. 99) or, in other words, a highly impersonal and individualistic epistemology. This epistemology reinforces the view that many colonized peoples have of themselves as “victims,” she argues, since a view of the self as highly objectified and removed from interpersonal relations implies passivity. To really deal with the legacy of colonialism, Bastien suggests that Blackfeet need to regain their personhood, their volition, and the strength made available to them through reciprocal relationships. As most indigenous peoples traditionally place some emphasis upon personhood and reciprocity, Bastien’s argument likely applies to other colonized peoples. Those who work with such peoples in the mental health field might benefit from examining her work further.

The Blackfoot religion provides much for the scholar of psychology and religion to consider. While the scholars should not ignore the material aspects of the religion – the physical world and the value of things like medicine bundles are very important – there is a clear psychological component to the religion. Practicing psychologists might view Blackfoot religion as an example of how familial and other interpersonal relationships can improve the quality of individuals’ lives. Moreover, the revitalization of Blackfoot religion indicates that a return to traditional ways might help indigenous peoples overcome some of the psychological damage caused by

colonialism. Finally, a closer look at Blackfoot religion can help both scholars and practicing psychologists understand Maslow’s work better. Such a look provides a new perspective upon Maslow’s theories, as Blood and Heavyhead demonstrate.

Bloch's Theories Concerning Religion

Heather McKnight
Law Department, University of Sussex,
Sussex, UK

From Hunger to Hope

Ernst Bloch (1855–1977) is frequently described as being the philosopher of hope and is credited with having returned dignity to the term utopia within critical theory. Bloch's theory begins with the individual self-experience and pre-experience. He explains how the self is emergent from hunger, from which emotions arise and understand us as creatures created out of internal forward reaching conflicts. For Bloch, the original drive is not linked with Freud's life and death drives, but with hunger. Bloch notes that hunger is "the drive that is always left out of psychoanalytical theory ... it alone might be so fundamental" (Bloch 1995a). In the immediacy, we die without nutrition; therefore hunger accompanies and precedes all emotions, and emotions precede sensations and imaginings. All other drives form contingently onward from this hunger which is subject to social conditioning. A fundamental flaw in psychoanalytical theory for Bloch is that the unconscious as defined by Freud is never a Not-Yet-Conscious progression but a regression; there is "nothing new in the Freudian unconscious" (Bloch 1995) and the part of our minds that creates and perceives the new is therefore absent. Bloch identifies a pre-consciousness, the presence of the potential future in the now.

Bloch focuses on the inward beginnings of change and a move toward a better future where our hunger is sated. The hunger that he speaks of manifests itself in a sense of waiting that cannot be resisted or desisted; it moves things forward even in pain or disappointment. This lack of completion of being for humans creates awareness and anticipation, toward an undetermined future (Bloch 1995). This marks the journey from "hunger to hope" which operates on a materialist basis

where matter is an active component in nature and humanity (Thompson 2013).

Doctrine of Hope

Bloch proceeds to develop his philosophy from here into a critical utopian process – a doctrine of hope. For Bloch, Utopia is "a better world," not necessarily perfected or complete (Bloch 1995). For this inherent forward reaching motion to be Utopian, to be orientated toward social good and not just selfish gain, Bloch identifies a critical utopian process that must take place. This occurs through the presence of both cold and warm streams, echoing those identified by Karl Marx. The warm stream is the possibility of a better world, it is the disruptive imagining of a positive difference beyond what exists now. The cold stream is a critique of the now, of this historical moment. In the cold stream, the difficulties and limitations of the dream of the better world must be overcome and constantly accounted for. Both of these streams must be in place in order for the utopian horizon to exist, to create the space for a material process that allows a better world to begin to develop.

Beyond Marxist Critique of Religion

Bloch's engagement with religion is apparent from his first book, *The Spirit of Utopia* (2000), which used the language of Theism to explore and explain the critical utopian process (Geoghegan 1996). He differs from many Marxist philosophers in his refusal to comply with a wholesale rejection of the worth of religion as merely "the opium of the masses," instead he sees it as having a valuable part to play. Bloch focuses on Marx's view of religion presented in his *Critique of Hegel's Philosophy of Right* (2009) and takes on Marx's idea that it is also the "sigh of the masses, the feeling of the heartless world, and the soul of the soulless circumstances" (Marx 2009) and as such part of the human path toward emancipation (Moylan 1997). Religion provides an illusory representation of the change needed in the

world, as such Religion as the opiate did not need abolished, but instead the social conditions that underpin the narratives of oppression and desire of emancipation (Hudson 1982).

For Bloch religion helps us understand what emerges from the human hunger, a hope for a better world. Religious narratives form the warm stream, describing a hopeful place and the possibility of a better world; narratives of poverty and oppression and struggle form the cold stream (Bloch 1995a). Here Bloch moves beyond Marx, he does not believe the time for religion has gone, its legacy is in fact inexhaustible, religion does not end with the death of God, but in a sense this is its genesis which reveals human potential to create a better world. (Geoghegan 1996)

It has been argued that the role religion plays in constructing and expressing humanity and society is of central concern to all of Bloch's work (Thompson in Bloch 2009). Bloch views the understanding of religion as key to understanding human culture, as religious consciousness expresses deep and profound aspects of human existence. As such, the analysis of religion is of fundamental importance and should be read as a form of human self-expression (Geoghegan 1996).

Hope Content Within Religion

Bloch is not uncritical of religion and views it, alongside other ideologies, as having the potential to oppress and stifle human potential by providing false hope. The mystical entities within religions do have the ability to reconcile people to unjust situations (Bloch 2009). He looks at the prevalence of religions all over the world in different cultures, seeing a common theme as their "irrealism," and that this is a key to their utopian content (Hudson and Bloch 1995a).

In opposition to Marxist thought, Bloch views religion as normal, and healthy, while people remain alienated, and the emancipation they hope for as unfulfilled (Hudson 1982). It is not something to be dogmatically followed but to be critiqued and explored, and through understanding its inherent contradictions, we will gain a

better understanding of the human condition, and of emancipatory possibilities, as well as modes of oppression. Religion needs to be understood as a revolutionary narrative. The notes that religions have "[f]ounders everywhere but they are not fully manifest unless they have pitted their new god against a traditional custom and a manless nature religion" (Bloch 1970). Religions have their place in challenging orthodoxy, and in providing an alternative to the status quo. Religion for Bloch becomes heretical and a protest against the norm (Bloch 2009).

Bloch examines this hope content within religions, looking at various religions, Judeism, Christianity, Islam, Zoroastrianism, Buddhism, Taoism, Confusionism, and other ancient religions of classical Greece, Babylonia, and Chaldaea (Bloch 1995a), but privileges Judeo-Christian religions within his historical analysis. He examines the characters within them as disruptive influences on the times in which they exist and sees them as reappropriating celestial power to provide substance and critique for social change toward an idealized goal. Both breaking from and drawing on the Marxist critique, Bloch provides an emancipatory reading of religions which removes God from a fixed figure of reality, to be replaced by the human utopian function, where the stories of religion give agency to human action on earth to create change for a better world in the here and now (Bloch 1995a).

Reinterpreting the Bible

Bloch's book *Atheism and Christianity* (2009) explores atheism as the truth of the bible and the deification of the human as the essence of religion. Bloch explores Augustine's statement that only the heretic can be a good Christian, adding "Only an atheist can be a good Christian, only a Christian can be a good atheist" (Bloch 2009). He seeks to locate the cold stream of critique within the bible, as well as a grasping for a better world. He looks at different interpretations of the bible, gnostic, heretical, and Judaic, to influence and inform his work; he sees these as "not outside of the text but part of the text"; through this Bloch

aims for a radical exegesis of the bible, reading it as deeply rooted in the political struggles of the poor (Geoghegan 1996).

For Bloch, Jesus utopainises God into the Kingdom of God, thus returning the ability to bring about Heaven on Earth to the hands of the community (Moylan 1997). Through doing this, Bloch is in essence rejecting the theistic basis of Christianity (Geoghegan 1996). He explores a reading of the bible that sees Jesus as rejecting God to instead finding a place among his creations on earth. Bloch analyses what he views as the transformative relationship that humans have with God in the bible, viewing Jesus as a fighter or revolutionary (Geoghegan 1996). "God becomes the kingdom of God, and the kingdom of God no longer contains a God" and that "the religious kingdom as such *involves atheism, at last properly understood atheism*" (Bloch 1995a). Atheism is not, however, the same as nihilism, it is the opening up of a space of hope and possibility, where there previously sat a hypostatized God, a God that is seen as fixed and real (Bloch 1995a).

For Bloch the apocalypse is the transformation of nature and the end of all religion; it is what must be passed through for the totality of Christianity to be realized (Bloch 1995a). He sees Christianity as having a key transformative potential when it allows those following it to move beyond the mythological orthodoxy. Essentially it provides the realization that there is no God to change things, or make things better, but the entire ability to control and shape the world for the better and the drive to do so lies with the human community (Bloch 1970).

Influence of Bloch's Theology

Bloch has had a notable impact on theology in Europe and Latin America in the 1960s through his reinstatement of this focus on hope and provision of method of approaching emancipatory narratives without focusing on deities and supernatural mythologies within the religions themselves. For example, Lutheran theologian

Jürgen Moltmann's significant publication the *Theology of Hope* (1967) was significantly influenced by Bloch (Hudson 1982). The political theology of Catholic scholar Johannes Metz also contains the influence of Bloch. This is apparent in how he places the transformative end-of-days narrative in central to his interpretation, as well as engagement with religion as critique rather than through control (Moylan 1997). Wolfgang Pannenberg, a German theologian, highlighted the importance of Bloch's work to the future development of theology as it gave courage to theology to consider the centrality of eschatology and the incomplete future (Hudson 1982).

However, Bloch's greatest influence was on liberation theology where there was a struggle to overcome severe poverty, suffering, and political struggle, in areas such as Latin America, South Africa, South Korea, and the Philippines (Moylan 1997). Gustavo Gutiérrez's *Theology of Liberation* (1973) is one of the key texts within liberation theology and contains influences of Bloch throughout, including the refusal to separate reality and the supernatural kingdom of God, his focus on history as the site of human liberation both material and spiritual, and on the utopian function that allows human action to be mobilized, linking "faith, utopia and political action" together (ibid). Liberation theologian Franz Hinkelammert also references Bloch in *The Ideological Weapons of Death: A Theological Critique of Capitalism* (1968) and focuses specifically on the conditions of exploitation and suffering in the capitalist world. Bloch has also been cited as an influence on non-orthodox liberation theologians, such as Paulo Freire, whose work focused on liberation through education (Giroux and McLaren 1997).

Bloch became influential as a radical commentator on theology and influenced a number of thinkers, providing a much needed discursive exterior to theology of the 1960s (Moylan 1997). Overall he provided a secular view of theology that modelled something post-theistic and post-individualist for theologians to work with, proclaiming the primacy of hope as a virtue as God becoming the future of humanity and relocating

the sense of self in relation to religion as one of agency rather than servitude (Hudson 1982).

Bodhi Tree

Paul Larson

The Chicago School of Professional Psychology,
Chicago, IL, USA

The Bodhi Tree is a symbol in Buddhism. It is so called because it was under such a tree that Siddhartha Gautama became the Buddha of this

age. By legend it was a fig tree (*figus religiosa*), known for its heart-shaped leaves. In modern Bodh Gaya, India, a tree at the Mahabodhi Temple is revered as the Bodhi Tree, though the exact spot where a tree stood in Buddha's day is not known with precision. The original tree was destroyed in the seventh century, but the current tree is a scion of a scion of the original tree which was sent by Asoka to Sri Lanka. For the pilgrims, it does not matter, because the act of reverence is sanctifying beyond the literal aspects of history.

Bodhisattva

Paul Larson

The Chicago School of Professional Psychology,
Chicago, IL, USA

In Buddhism, the “Bodhisattva” (Snskt) is one who has realized enlightenment, or “nirvana,” but out of compassion for the suffering of sentient beings has deliberately resolved to delay reaching final nirvana, complete release from samsaric rebirth, in order to aid others in achieving enlightenment. This is a principal doctrine of the Mahayana tradition of Buddhism, also known as the northern transmission, since it passed into the rest of Asia from India northwest via the Silk Road. It is the motivation that drives spiritual development in the Mahayana and Vajrayana traditions in contrast with the model of the arhat,

which is the motivating ideal in Theravada Buddhism, the southern transmission, going from Sri Lanka to the rest of Southeast Asia.

The Bodhisattva vow is taken by lay and monastics alike in the Mahayana tradition and involves the commitment to work for the release not only of oneself (the goal of the arhat) but for all sentient beings. The eighth-century Indian Buddhist scholar, Shantideva, authored the *Bodhicaryavatara*, roughly translated as the path of the bodhisattva, which is one of the major statements of Mahayana doctrine, and a source of numerous commentaries. The ethical heart of the image of the Bodhisattva is compassion, and any merit one's actions gain is dedicated, therefore, to the enlightenment of all sentient beings. In Buddhist iconography, images of transcendental Buddhas and Bodhisattvas are numerous. Among the most important of the Bodhisattvas is Avalokiteshvara in the Indian and Tibetan traditions and Kuan Yin in the Chinese, Korean, and Japanese traditions. The former is represented as a male, the latter as a female. These images are used in meditation to generate the underlying attitude of compassion and also serve as foci of devotion, prayers, incense, and other offerings. Other important Bodhisattvas include Manjushri the Bodhisattva of transcendent wisdom and the Bodhisattva who will become the next Buddha, Maitreya.

Body and Spirituality

Roberto Refinetti

Psychology, University of South Carolina,
Walterboro, SC, USA

In secular philosophy, the distinction between body and spirituality is more commonly known as the distinction between body and mind. In either case, it is assumed that humans have at least two dimensions: a material one (body) and a spiritual one (mind). How these two dimensions relate to each other is a contentious matter.

Body and Mind

For over a century, it has been a common understanding that the part of the body related to mental activity is not the foot, the heart, or the liver, but the brain. Thus, the so-called mind-body problem is actually the mind-brain problem – that is, how psychological phenomena relate to the activity of the nervous system. Many potential types of relationship between mind and brain have been proposed. Classifications of systems of ideas are always arbitrary to a certain extent, but a convenient classification recognizes four major groups: idealism, mentalism, psychophysical parallelism, and materialism (or materialist monism).

Idealism refers to a conception that only the mental realm truly exists and that the brain (and the rest of the material world) is merely an illusion. This position has very few sponsors nowadays. Mentalism refers to the conception that mental events can be fully explained by psychological concepts without any reference to the nervous system. This is a dualistic viewpoint, as it implies that mind and brain are distinct and largely independent from each other. Psychophysical parallelism refers to the conception that mind and brain are distinct but closely related to each other. This form of dualism may imply that mind and brain are only different sides of the same coin

or even that neural activity can affect the operation of the mind without actually creating the mind. Finally, materialist monism refers to the conception that mental events are nothing more than neural events. This is a monist viewpoint because it implies the existence of only one dimension – the neural dimension.

As one reads the scientific literature, one gains the impression that psychophysical parallelism is the dominant conception among behavioral neuroscientists. To start with, the idea that mental events are correlated with neural events has a long tradition in psychology. Four of the major psychologists in the late nineteenth century and early twentieth century made explicit statements about the parallelism between mind and brain: the highly influential William James, the father of psychoanalysis (Sigmund Freud), the discoverer of classical conditioning (Ivan Pavlov), and the creator of the intelligence test (Alfred Binet). Particularly after the development of positron-emission tomography (PET) and functional magnetic resonance imaging (fMRI), it has become evident that activity in particular circuits of the brain is correlated with particular mental events.

Going beyond mere correlation, however, lesion and stimulation studies in animals and in brain surgery patients have provided evidence that mental events do not have a life of their own – that is, that mental events can be reduced to neural events. As philosopher Mario Bunge put it, behavioral neuroscience performs a limited type of reduction: an ontological reduction without full epistemological reduction, but nonetheless a reduction. Thus, although most neuroscientists are not themselves aware of it, their work actually provides support for materialist monism. The reduction of mind to matter is also a basic assumption in cybernetics, as Norbert Wiener (the creator of cybernetics) asserted that if we could build a machine whose mechanical structure is entirely consistent with human anatomy and physiology, then we would have a machine whose intellectual capabilities are identical to those of human beings.

It is not difficult to see why behavioral neuroscience needs the reduction of mental events to neural

events. After all, if one can see, touch, and disturb nerve cells, one would like to do the same with mental events. Because one cannot do the same with mental events, one assumes that they do not really exist. If mental events are neural events, then there is no immaterial world to be dealt with. Thus, we feel terrified or ecstatic, drowsy, or excited, because of specific electrochemical processes taking place in our brain. Likewise, so-called psychological causes of mental illness are merely those causes whose neural bases are not yet known. In general, to understand behavior is to understand the action of the nervous system. The mind is simply a name associated with brain functioning, just like breathing is a name associated with lung functioning and movement is a name associated with particular forms of muscle functioning. Francis Crick (Nobel laureate for the discovery of DNA) called this The Astonishing Hypothesis because most people who are not neuroscientists (and even many neuroscientists) are astonished to learn that the mind is nothing more than a label attached to the operation of the brain.

Body and Soul

Although various religions have pronouncements about the relationship of mind and body, the lack of technical detail in these pronouncements prevents close comparisons with the secular perspective. A major roadblock is the nebulous distinction between mind and soul. In Christianity, both Augustine and Aquinas held that the soul lives in the body but is nonmaterial and immortal. Because most psychologists believe that the mind ceases to exist when the body dies, the soul must be distinct from the mind. Thus, there may be a need to recognize three human dimensions: body, mind, and soul, which are only loosely related to the Ancient Greek concepts of soma, psyche, and pneuma. On the other hand, mind (or spirit) and soul are used interchangeably in many biblical passages, which favors a simple dichotomy of body and soul (the latter somehow incorporating the mind).

The major difficulty in equating mind and soul is that the qualities of the mind cannot be properly characterized without the restrictions of time and space, whereas the soul is eternal and not bound by geography. For instance, in Piaget's model of cognitive development, the mind of a 4-year-old child operates according to a preoperational scheme, whereas that of an adult operates according to a formal operational scheme. Under what principle does the soul operate? Similarly, the mind of an American speaks English, whereas the mind of an Angolan speaks Portuguese. What language do their souls speak? It would seem that the soul must be distinct from the mind. In this case, the concept of spirituality would be related partly to the mind and partly to the soul.

Whether or not the mind is considered to be the same as the soul, the concept of the soul is incompatible with a materialist view that reduces spirituality to the operation of nerve cells. Therefore, the religious perspective (at least in the tradition of Christianity) favors either idealism or mentalism (as defined above) and is, therefore, in disagreement with the secular perspective that favors psychophysical parallelism and materialist monism as explanations for the relationship between body and spirituality. In analytic psychology, Carl Jung was a major proponent of mentalism and had great interest in religion.

Boisen, Anton

Curtis W. Hart

Weill Cornell Medical College, New York,
NY, USA

Boisen's Life

Anton T. Boisen was born in Bloomington, Indiana, in 1876. His early life was marked by the death of his father at the age of 7. An able scholar and student, he graduated from the University of Indiana at Bloomington and taught romance languages there for a time before entering the Yale School of Forestry. Later he attended Union Theological Seminary in New York where he studied under George Albert Coe, a professor steeped in the approach of William James to the psychology of religion. After the ordination in the Presbyterian Church and a lackluster career of some 10 years in the parish ministry, he experienced in 1920 the first of three psychiatric hospitalizations where his diagnosis was that of schizophrenia of the catatonic type. The second occurred in 1930 after the death of his mother and the third on the occasion of the death of the love of his life, Alice Batchelder, a woman he courted for years even as she consistently rebuffed his advances and proposals of marriage. He became convinced that his firsthand encounter with mental illness was for him, as he often said, a "problem-solving experience" that permitted him a new lease on life and vocation when he was well into middle age. He set about the task of educating seminarians and clergy about mental illness and ministry in mental health in the hospital setting and doing research in the sociology of religion and the psychology of religious experience. This investigation into mental illness and religions experience utilized what he had personally gone through and followed William James' descriptive and biographical approach to these phenomena in his magisterial work *The Varieties of Religious Experience* (1902). Boisen held two major chaplaincy positions, first at Worcester

(Massachusetts) State Hospital and later at Elgin (Illinois) State Hospital where he died in 1965.

Boisen's Contribution to Psychiatry

Boisen made invaluable contributions to the dialogue between religion and psychiatry. His pioneering work includes, first, his efforts at establishing pastoral care as part of treatment in psychiatric institutions and, second, his passionate interest in the education of seminarians and clergy through encounters with what he called "the living human documents," individuals making their way through psychiatric illness, an experience he poetically describes as "the wilderness of the lost." He inspired individuals to follow him into this field of endeavor that evolved overtime into clinical pastoral education that is regularly offered to or required of those involved in graduate theological education. At the same time, he tirelessly promoted his ideas and articles of an interdisciplinary character that reached a wide professional audience in both the religious and psychiatric communities. Besides his autobiography, *Out of the Depths* (1965), he also wrote *The Exploration of the Inner World: A Study of Mental Illness and Religious Experience* in 1936, a work that is still regarded as a classic in the field. His articles appeared regularly in the journal *Psychiatry*, a publication edited by his friend and colleague, the well-known and highly regarded psychiatrist Harry Stack Sullivan. Sullivan thought very highly of Boisen whose books he reviewed and ideas and writings he utilized and quoted. He also visited Boisen's pastoral education training programs at Elgin State Hospital where he interviewed patients for student groups and shared in their case reviews. Boisen's work has been highly regarded enough to have one of his pieces entitled *Personality Changes and Upheavals Arising Out of a Sense of Personal Failure* written in 1926 and published in the *American Journal of Psychiatry* included in that August publication's *Sesquicentennial Anniversary Supplement* in 1994. There it appeared alongside seminal pieces by such luminaries as

Sullivan, Erich Lindemann, and Leo Kanner. Boisen's article focuses upon the existential dimension of the experience of mental illness as it relates to broader philosophical concerns. The article demonstrates both his analytical gifts and rhetorical powers.

Boisen's Legacy

The latter half of Boisen's life was filled with professional success along with a great deal of personal loneliness. His efforts in promoting the dialogue between psychiatry and religion were formidable. Among his shortcomings was what critics have identified as his all too clear and certain separation between organic and functional causal factors in psychiatric illness. He also developed as years went on something of a brusque, authoritarian manner in dealing with both colleagues and students. He also lacked the organizational skills to help guide the twentieth century's clinical pastoral movement past its early stages in the 1920s and 1930s. He remains, however, an important figure and formative influence whose person and ideas deserve ongoing attention.

Bolen, Jean Shinoda

Felicity Brock Kelcourse
Pastoral Theology and Psychology/Jung, Christian
Theological Seminary, Indianapolis, IN, USA

Source: C. G. Jung Institute of Chicago Jung publication

Introduction

The work of Jean Shinoda Bolen, psychiatrist, Jungian analyst, and internationally recognized author and speaker integrates gnosis and logos, spiritual insight and logic; her 13 books illustrate the spiritual relevance of Jungian archetypes for our times. As a Japanese-American woman, she thinks beyond the confines of her nation to the well-being of all women and Gaia (Earth) herself. As a psychiatrist, she works holistically at the intersection of mind, body, and soul. As a Jungian analyst, she balances introspection with activism, serving as a leading advocate for the United Nations fifth World Conferences on Women (<https://www.5wcw.org/>).

Accolades and Credentials

Among her many achievements, Dr. Bolen is a Distinguished Life Fellow of the American Psychiatric Association, a former clinical professor of psychiatry at the University of California at San Francisco, past board member of the

Ms. Foundation for Women, and the International Transpersonal Association.

A Diplomate of the American Board of Psychiatry and Neurology, she received the Institute for Health and Healing's "Pioneers in Art, Science, and the Soul of Healing" award. She is an analyst member of the C.G. Jung Institute of San Francisco and the International Association for Analytical Psychology, a past member of the Board of Governors of the C.G. Jung Institute of San Francisco, and past Chairperson of the Joint Certifying Board of the Northern and Southern California Societies of Jungian Analysts. She founded and co-chaired Psychiatrists for ERA, a major influence within psychiatry in the early 1980s, that evolved into the Association for Women in Psychiatry. Dr. Bolen was featured in two documentaries, the Academy-Award winning anti-nuclear proliferation film "Women – For America, For the World," and the Canadian Film Board's "Goddess Remembered." The Millionth Circle Initiative (www.millionthcircle.org) was inspired by her eponymous book (1999) and led to her involvement at the UN. She is the initiator and leading advocate for a UN fifth World Conference on Women (<https://www.5wcw.org/>), supported by the Secretary General and the President of the General Assembly on March 8, 2012, scheduled to take place in India in 2022. Her books appear in over 80 translations worldwide. Access to videos, interviews, and her full CV is available from her website, www.jeanshinodabolen.com.

Biography

Jean Shinoda was born in 1936 to powerful parents. Her mother, Megumi Yamaguchi, was a doctor. Her father, Joseph Shinoda, a successful businessman who died during Jean's psychiatric residency (1963–1966), fully supported her academic success and aspirations. A brother, whose life was limited by developmental delays, taught her humility in relation to her own gifts. Growing up as a city kid in Los Angeles, she discovered the wonder of nature during summer camps, sleeping under the stars. Upon completing her residency,

she married James Bolen, a publisher, raising a son Andre and a daughter Melody during their 19-year marriage. In 1979 Dr. Bolen published her first book, *The Tao of Psychology: Synchronicity and the Self*, exploring connections between Taoist understandings of a balanced life, in harmony with nature, and Jung's understanding of synchronicity as meaningful chance. While serving as a psychiatrist in private practice, and as a supervising Jungian analyst, she has continued to write and speak, expressing her expertise and personal insights in broadly accessible terms. The suffering she has witnessed, personally, through the deaths of her parents and her 29-year-old son, and professionally, as a doctor and psychiatrist, contribute to her spiritual wisdom and empathy for the human condition. Her Jungian training informs her fluidity in moving from the depths of intrapsychic experience to the archetypal dimensions of the collective unconscious, writ large in societal, planetary terms.

Publications

In *The Tao of Psychology: Synchronicity and the Self* (HarperCollins 1979, 25th anniversary edition, 2004), Dr. Bolen explores the phenomenon of meaningful chance, as described by Jung in his essay "Synchronicity: an Acausal Connecting Principle" (1955, Collected Works 8). At the time, Jean occasionally participated in research for the magazine *Psychic*, later renamed *New Realities*, published by her then husband James Bolen, which aimed to explore "developments in the emergent areas of human possibilities that affect our everyday lives." She links synchronicity to the Tao as "the path with heart" . . . "directed towards the ideal of basing outer action on inner wisdom" (2004, pp. 86–87).

Her next book, *Goddesses in Everywoman: Powerful Archetypes in Women's Lives* (HarperCollins 1984, 20th anniversary edition, 2004, 30th anniversary edition, 2014) illustrates patterns in women's lives as exemplified by seven goddess archetypes. Personality types that may influence women's self-expression in

relational terms based on Greek mythology include the virgin goddesses, Artemis, Athena, and Hestia; the vulnerable goddesses, Hera, Demeter, and Persephone; and the alchemical goddess, Aphrodite. Enthusiastic responses to this book lead to a sequel, *Gods in Everyman: Archetypes that Shape Men's Lives* (HarperCollins 1989, 25th anniversary edition, 2014). Men's archetypes are divided between the father type, Zeus, Poseidon, and Hades; and the son type, Apollo, Hermes, Ares, Hephaestus, and Dionysus. In *Ring of Power: Symbols and Themes in Wagner's Ring Cycle and in Us*, Bolen explicates psychological dimensions of Norse mythologies that illustrate the sins of patriarchy. The Rhinegold represents the psychological cost of the quest for power, with the god Wotan as the narcissistic father, the hero Siegfried and his counterpart Brunnhilde as abandoned or rejected children, and three female figures, Freya – goddess of love, Fricka – Wotan's truth-telling wife, and Erda – goddess of Earth and wisdom, as the devalued feminine. The curse of the Ring, and of patriarchy, is the choice of power over love.

Crossing to Avalon: A Woman's Midlife Quest for the Sacred Feminine (HarperCollins 1994) is a memoir of spiritual awakening; Jean's own mid-life quest for meaning following her divorce. In *Close to the Bone: Life Threatening Illness as a Soul Journey*, Dr. Bolen reflects on the effects of physical suffering that face us with soul questions "What did we come to do? What did we come to learn? What did we come to heal? What and who did we come to love? What are we here for?" (Italics in original, p. 19).

The Millionth Circle: How to Change Ourselves and the World (Conari Press 1999) suggests that the consciousness raising groups that supported the rise of feminism in the 1970s can serve to change the world. Bolen believes that a critical number of women's circles are needed "(f)or patriarchy to become balanced by the discerning wisdom and compassion that are associated with the feminine aspects of humanity, and by the indigenous wisdom and relatedness to all living things and the planet" that has been lacking in Western civilization (p. 14). Two

subsequent books, *Urgent Message from Mother: Gather the Women, Save the World* (Conari Red Wheel 2005) and *Like a Tree: How Trees, Women, and Tree People Can Save the Planet* (Red Wheel/Conari 2011) elaborate on these feminist, ecological themes. The latter was inspired by her grief when a neighbor forced her to cut down a beautiful old tree that blocked the neighbor's view, causing Bolen to reflect on deforestation's contribution to climate change worldwide.

In *Goddesses in Older Women: Archetypes in Women over Fifty* (Harper Collins 2001), *Crones Don't Whine: Concentrated Wisdom for Juicy Women* (Red Wheel/Conari 2003), *Moving Toward the Millionth Circle: Energizing the Global Women's Movement* (Red Wheel/Conari 2013), and her most recent book *Artemis: The Indomitable Spirit in Everywoman* (Red Wheel/Conari 2014), Bolen returns to her feminist theme of women's empowerment, necessary for the health, sanity, and survival of humankind in our current age.

Jean Shinoda Bolen and Archetypes

As early as 1914, Jung had begun to formulate a theory of archetypes as patterns occurring across time and culture, shared in the collective unconscious of human kind (CW 3, para 413). Jean Shinoda Bolen has made this theory relevant for our times by finding in the figures of Greek and Norse mythology, personality patterns that may unconsciously predetermine the attitudes and actions of contemporary women, men, and families. The value in consciously facing these patterns is that it affords us the possibility of choice. She writes "Just as women used to be unconscious of the powerful effects that cultural stereotypes had on them, they may also be unconscious of powerful forces within them that influence what they do and how they feel...goddess patterns ...offer insights into what is motivating (even compelling), frustrating, or satisfying to some women and not to others (1984, pp. 1–2)."

Jean Shinoda Bolen and Feminism

Dr. Bolen's understanding of archetypes has informed her work as a feminist, working to support the Equal Rights Amendment (introduced in 1972, but never ratified) as well as her support for the United Nations World Conferences on Women. "The Jungian perspective had made me aware that women are influenced by powerful inner forces, or *archetypes*... the feminist perspective has given me an understanding of how outer forces, or *stereotypes* – reinforce some goddess patterns and repress others" (1984, p. 4). Her "millionth circle" books (1999, 2013) refer to "a simple hypothesis, whose mechanism has been proposed and observed, and is one that can be intuitively and immediately grasped: When a critical number of people change how they think and behave, the culture does also, and a new era begins." (1999, p. 3)

Jean Shinoda Bolen and Ecology

The new era the world needs now is one in which the rights of women, children, and indigenous peoples are understood as an essential component of right action to reverse the increasingly devastating effects of climate change. In *Urgent Message from Mother* Bolen states that "(w)omen with concern for humanity and the environment carry within them seeds of compassionate activism...Reality on the ground comes through hearing about the scope of preventable suffering that affects women and children, coupled with indifference and exploitation by those in power (2005, p. 5). Empathy for all persons, for all life is "...the antidote to the state of mind that has put us all and Mother Earth in harm's way." (2005, p. 9)

Conclusion

Through all her persona roles as a Japanese-American doctor, psychiatrist, Jungian analyst, ERA and UN rights of women activist, author,

speaker, and teacher, the breadth and depth of Jean Shinoda Bolen's spiritual vision and compassionate humanity shines through. She has the gift of presenting her experience of archetypes, feminist awareness, and ecological concerns in ways that make these ideas eminently accessible to others. As the actions of her life speak, she has clearly chosen the path with heart.

Bonnell, John Sutherland

James G. Emerson
San Francisco, CA, USA

Introduction

In 1962, John Sutherland Bonnell (January 10, 1893–February 26, 1992), known as “Sid” to his closest friends, retired as Pastor of the Fifth Avenue Presbyterian Church in New York City.

Contribution from the Personality Sciences

Although known best through his radio ministry when he succeeded Harry Emerson Fosdick as the preacher on ABC's National Vespers, his basic contribution lay elsewhere. As a pastor, Dr. Bonnell brought the insights of psychoanalysis into the world of pastoral care in a way that gave those of conservative faith access to that field. In effect, his witness gave the conservative pastor “permission” to see the positive contributions of Freud, Jung, and Adler to the practice of ministry – even though the pastor might not agree with the philosophical or psychological views of any of those three when it came to the Christian faith.

In many ways, through his books *Pastoral Psychiatry and Psychology for Pastor and People*, Dr. Bonnell opened doors not only for what clergy might do but what people in the pew might consider both for themselves and for their “lay ministries.”

Brief Biography

“Sid” Bonnell was born in a barn on a farm of Dover, Prince Edward Island, Canada. He became a truant in the eighth grade and worked in Falconwood Hospital – a hospital for the “insane” – of Charlottetown, PEI, where his father

had become superintendent. (His father was not a doctor but a farmer with administrative skills who was brought to the management of the hospital.)

In that hospital a patient by the name of Brown took interest in the tall, lanky young Bonnell and tutored him. Out of that training he passed the examinations for entrance to Prince of Wales College, and he was on his way. The hands-on experience of working in the Falconwood Hospital, however, remained the background and basis for Bonnell's further studies as the works of Sigmund Freud and William James became part of the educational scene in Canada and the United States.

"Sid" Bonnell also enlisted in the Canadian army in World War I, was twice wounded in Europe, and then was sent home after suffering the effects of mustard gas. A shell fragment would have taken his life were it not for a large watch that he carried in his chest pocket. The watch deflected the fragment.

Princeton Lectures

In 1923 "Sid" married Bessie Louise Caruthers, of Charlottetown, PEI. She was the daughter of a prominent physician on "the Island." The Bonnells had four children, George, Catherine, Elizabeth, and Margaret.

After a four point pastorate in the area of Cavendish, PEI (a community made famous by the story of *Anne of Green Gables*), the Bonnells moved to the St. Andrews parish in St. John New Brunswick, the Westminster Church of Winnipeg, Canada, and then in 1936, the pastorate of the Fifth Avenue Presbyterian Church in New York City. Although the Bonnells became American citizens, they never lost their Canadian roots. Three months of every summer found them on Prince Edward Island where Dr. Bonnell did most of his writing.

Basic Viewpoint

After writing the book *Pastoral Psychiatry*, Dr. Bonnell also became a visiting lecturer at Princeton Theological Seminary in New Jersey.

His course basically dealt with case studies that grew out of his own experience. His early work showed the influence of Sigmund Freud's writings, but Dr. Bonnell never moved the work of pastoral care into a pastoral model of Freudian analysis. Rather, he used the nomenclature of Freud's work, such as "the Oedipus Complex," as a tool for helping a parishioner identify the nature of a problem. He wrote, "...the minister who values his time and desires to conserve his mental and spiritual resources will inform himself of the teaching of these sciences that deal with the human mind" (Bonnell 1938, p. 53).

Dr. Bonnell therefore saw the science of psychotherapy as something that spoke not just to therapy and counseling but to the whole range of one's ministry.

The Context of Care

Dr. Bonnell took seriously the context in which the "cure of souls" (read, "care of souls") took place. He made use of a small but comfortable room with cathedral style window frames that gave both a church frame of reference and a source of comfortable outside light. On the wall he had a picture of Christ at prayer in Gethsemane. The parishioner sat in an upright but comfortable chair and Dr. Bonnell sat behind a small desk that served simply as a prop for use when necessary but did not give the impression of an imposing study.

The room for this counseling was set across a hall from the entrance to the floor and avoided both the pastoral offices and the secretarial offices. The context for the pastoral counseling was therefore both private and faith centered but not doctrinally overwhelming.

Evaluation of His Work

Dr. Bonnell never developed a particular system for pastoral care nor did he formulate a theological construct for his work. Basically, Dr. Bonnell was a practitioner and his lectures were more case studies than theoretical discussions. Whereas the work of Norman Vincent Peale, a contemporary

and friend in New York, became popular best sellers, much of the two key books in the field by Dr. Bonnell centered on the work of the pastor. His lectures at Princeton were heavily attended.

The Evaluation by Others

Others in the academic field of that day, such as Seward Hiltner of Chicago and Princeton and Hans Hoffmann of Harvard, saw three strengths in Dr. Bonnell's work: an uncanny ability to sense an individual's "real" problem when that person went to the counseling room; a clear, structured means of communicating an answer to that problem; and a clear context of faith that was not imposed on the one with a problem but created an atmosphere of safety and of concern.

The weaknesses observed by these and others were the following: a person with a weak ego could be overwhelmed and lost in the "larger than life" presence and approach of Dr. Bonnell; for the same reason, pastors often tried to imitate him rather than understand the dynamics behind a counseling session. That failure resulted in a pastor or student failing to develop his or her own approach to a parishioner. The lack of a theoretical framework within which to understand the counseling process left a major need in the area of pastoral care and counseling.

Books Written

Although Dr. Bonnell wrote some 13 books in his lifetime, the key ones that relate to the field of psychology and religion are listed below.

In the first two of these, Dr. Bonnell spoke of pastoral psychology as the "healing of the soul"; E. B. Holifield sees him as understanding the goal of pastoral psychology as that of "keeping one in touch with God and the spiritual resources that flowed from God" (Hunter 1990, p. 105). His practice also showed three dimensions: a dimension of personal strength and competence that he brought into the counseling room, a dimension of concern for the well-being of the parishioner who came for help, and a dimension of diagnostic accuracy the later professionals such as Seward

Hiltner regarded as remarkable (in personal conversation with the writer).

His solutions were practical and immediate. It was not uncommon for a counselee to leave the office with a sense of direction and an immediate task to do. One such counselee needed space and time to work out his concerns and Dr. Bonnell facilitated his having work on a farm for a summer. Another counselee needed a meaningful role that would give a sense of purpose in life and found herself given an opportunity to visit shut-ins. That opportunity had the double value of meeting the need of others and, in so doing, meeting her need for a meaningful role in life.

Some sessions ended with prayer, but that was not the rule. Dr. Bonnell was not "client centered" in the way of Carl Rogers, but he was aware of where the person was, of what the person brought to the counseling moment, and of the fact that the person, not he, set the agenda for the hour in the counseling room.

In the third of these books, Dr. Bonnell sought to reach lay people. In a day called "the age of anxiety," he focused on anxiety and both inadequate remedies and sound remedies. He had a particular concern for the issue of the ultimate escape – namely, suicide. In the book, he sought to help the reader learn how to confront the problems of the day from a spiritual as well as a psychological frame of reference.

Bowlby, John

Jeanne Stevenson-Moessner

Practical Theology, Perkins School of Theology,
Southern Methodist University, Dallas, TX, USA

Edward John Mostyn Bowlby (1907–1990) was a pioneer in the field of attachment theory. His three-volume exposition of attachment, separation, and loss continues to impact both the fields of psychology and religion. John Bowlby depicted the infant as a “relational self” and elaborated on the significance of the maternal attachment. The term “mother figure” meant “that person to whom a child directs his [her] attachment behavior by preference” (Bowlby 1973, p. 22). By understanding the child as a connected self or a self-in-relation, John Bowlby contributed to the ongoing resistance to a cult of individualism or autonomy. He broke with psychoanalytic theory in his emphasis on the impact of real life events on the internal world of the infant in contrast to the role of fantasy as determinant of the infant’s unconscious realm.

Psychology and Religion: Attachment theory as developed by John Bowlby has offered a major theoretical framework for researchers in the psychology of religion. This theoretical framework has supported ongoing inquiry into the relationship between childhood “parental” attachments and subsequent adult religious beliefs. “Ever since Freud’s well-known proclamation that God represents an ‘exalted father figure,’ psychologists of religion have wondered about the relationship between early childhood experience and subsequent religiosity” (Kirkpatrick and Shaver 1990, p. 315). Bowlby’s work in attachment theory supports current empirical and clinical investigation into religion’s promotion of and psychology’s study of divine attachment figures.

Family Background: John Bowlby was born into an upper-middle-class family in London in 1907. His social location is significant to his research. As typical in that class and time period,

a nanny was hired to raise John. John formed a close maternal attachment to his nanny. The time spent with his biological mother was 1 h a day, after tea time. When John was 4 years old, his nanny left the family. This was his critical experience of separation and loss (Bowlby and King 2004, p. 17). At age seven, he was sent to a boarding school which was a difficult familial separation.

Clinical Background: John Bowlby studied psychology and preclinical sciences at Trinity College, Cambridge. After Cambridge, his work with delinquent children helped shape the course of his future studies and research. At the University College Hospital in London, he qualified for medicine and simultaneously enrolled himself in the British Psychoanalytic Institute where he was supervised by Melanie Klein and others. After his medical studies, he trained in adult psychiatry at Maudlin Hospital and received certification as a psychoanalyst. During World War II, Bowlby was a Lieutenant Colonel in the Royal Army Medical Corps and was recruited to work with staff from the Tavistock Clinic in London on office selection procedures. After the war, he was asked to become head of the Children’s Department of the Tavistock Clinic. His renaming of the clinic gave evidence to his emphasis on family process, family events, and familial attachments. He renamed the clinic: Department for Children and Parents.

Contributions: The World Health Organization (WHO) named Bowlby as Mental Health Consultant in 1950. As such, he was able to observe and research the displacement of children in Europe and the resulting impact of separations. Wartime events created separations: children were evacuated from London during periods of air raids, Jewish children were imprisoned in camps, and young children were placed in nurseries to allow their mothers to work for the war effort. Bowlby training in medicine, psychiatry, and psychoanalyst positioned him to create observational and theoretical work that was unique in terms of attachment theory. His three volumes (Bowlby 1969, 1973, 1980) on attachment, loss, and separation remain a classic trilogy. In 1940, Bowlby wrote an article for the *International Journal of*

Psychoanalysis titled “The influence of early environment in the development of neurosis and neurotic character.” In this article he likened psychoanalysts to nurserymen: they should study the nature of the organism, the properties of the soil, and their interaction” (Bowlby 1940, p. 23). Bowlby opened his trilogy by a comparison of his theory to that of Sigmund Freud’s. As journeymen, they were tilling the same field of “instinctive behavior.” However, the furrows of the two men were from diametrically opposite corners. According to Bowlby, the tilling “contained all those same rocky excrescences and thorny entanglements that he [Freud] had encountered and grappled with – love and hate, anxiety and deference, attachment and loss” (Bowlby 1969, p. xi). From his corner of attachment theory, Bowlby has offered cross-fertilization of a field that continues to be enriched by the fertile minds of men like Bowlby and Freud and women like Mary Ainsworth and Melanie Klein.

Brahman

David A. Leeming

University of Connecticut, Storrs, CT, USA

Blanton-Peale Institute, New York, NY, USA

For Hindus, especially those in the Advaita Vedanta tradition, Brahman is the undifferentiated reality underlying all existence. Brahman is the eternal first cause present everywhere and nowhere, beyond time and space, the indefinable Absolute. The gods are incarnations of Brahman. It can be said that everything is Brahman. And it can be argued that Brahman is a monotheistic concept or at least a monistic one, since all gods – presumably of any tradition – are manifestations of Brahman and real only because Brahman exists. In Hinduism such manifestations would include the great goddess Devi as well as the triad of major deities, Shiva, Brahma, and Vishnu.

As a psychological principle, Brahman shares with the deity concepts of other traditions the task of giving meaning to our inner lives. The existence of the gods we create give significance to our existence as human beings in an otherwise seemingly arbitrary universe.

More specifically, in Hinduism, Brahman becomes a psychological concept because Brahman is inseparable from Atman. Atman is the “Lord of the heart,” the Brahman, or ultimate soul, in each human being. Through Atman, therefore, Brahman is imminent as well as transcendent. Atman is the ultimate self, the union within ourselves with Brahman. Such union is the goal of life. Readers of Carl Jung will recognize the influence of the Brahman-Atman concept on Jung’s psychological theories. Jung identified Brahman with the psychological principle in which the

creative libido is concentrated, leading to individuation, the blissful state in which there is full realization of self, the goal of the psychological life process (Jung 1971, p. 789). Through union with Brahman, the opposites of life are reconciled. Jung even referred to self, like Atman, as a “god image” (Jung 1969, p. 334), linking him closely to Vendantic thought about the psyche.

Braj Poetry

Amitabh Vikram Dwivedi
College of Humanities and Social Sciences –
Languages and Literature, Shri Mata Vaishno
Devi University, Katra, India

Introduction

The taxonomy of the romantic heroine in the Braj poetry is extended and elaborated. The

nomenclature employed for each kind is descriptive and far beyond the regular, hackneyed girlfriend, lover, beloved, sweetheart, and darling type. The Braj poetic expressions not only inform us about romantic or sexual relationship between two lovers, married or unmarried, but also express their psychological states of mind. The taxonomy follows a pattern that was well established in the *Bhagavata* and *Gita Govinda* and further mastered and reached to its perfection in the hands of Keshavdas and others. The Braj poetic expressions also reflect the religious overtone in its backdrop. The Hindu god and goddess, i.e., Krishna, Radha, and Gopis, are actually metaphors for lovers and beloved. This chapter focuses on the psychological and religious aspects of the romantic heroine and analyzes her moods, manipulation, persona, and psyche enveloped in the Braj poetry.

Discussion

The Sanskrit language declined in the second millennia due to lack of patronage as one of the chief reasons in India; however, it refashioned itself in Braj and in Bhakha poetry (Part 1: Exploring love 2018). Tulsidas, a medieval poet, had written his *Ramchritmaanas* in *Avadhi*, which is found in every Hindu household, reportedly states, *Sanskrit hai koopjal aur bhaashaa bahtaa neer* “Sanskrit is a stagnant water whereas Bhaashaa or the vernacular is a flowing river” (Part 1: Exploring love 2018). Tulsidas sensed the decline of Sanskrit, and the century after him produced various styles and critical works derived from Sanskrit in the Braj language, starting with Malik Mohammed Jayasi’s *Padmavat* (composed circa 1540s) which shows his deep knowledge of Sanskrit and Hinduism. The epic poem restores the primacy of love and desire, including erotic love and the pain of separation and jealousy. Jayasi’s and the Braj poets’ treatment of love is a cocktail that includes *prem* “love,” *shringara* “adornment,” and *kama* “lust” (Busch 2010). Rahim, a poet in Akbar’s court, also wrote verses on *naayikaabheda* “taxonomy of romantic heroine”; however, *lakshan* “definitions” were

missing in Rahim's verses which we found in the Braj poets abundantly (Busch 2010).

The heroines of *Bhagavata* and *Gita Govinda* are goddess Radha and her *Gopis*, "play maids of Radha" (Deheija and Sharma 2009). The *dashama skandha*, "tenth episode" of the *Bhagavata*, depicts Krishna as a romantic lover who performs and celebrates various *kridaas* and *lilaas* with Radha and *Gopi* as a pastoral cowherd. Jayadeva in his *Gita Govinda* presents goddess Radha as a central heroine who teases and woos and dallies and dances with Lord Krishna (Deheija and Sharma 2009). Braj courtly poets brought Lord Krishna down to earth and made him totally human. They also transformed the rustic *Gopi* "maid" into a courtly *naayikaa* "heroine." The Bharata's eightfold description of heroines in *Natyashashtra* transformed into manifold in the hands of Braj courtly poets. However, it was Keshavdas who set the tone of courtly *naayaka-naayika bheda* "taxonomy of the romantic hero and heroine" by creating numerous romantically sensuous and aesthetically charged situations.

The *naayika* "heroine" saw a transformation in the hands of courtly Braj poets. Earlier, the heroine was either goddess Radha or a rustic *Gopi* "maid," but now she is transformed into a romantic heroine of courtly love – she is both *ramini* "desirable" and *kaamini* "sensuous" woman (Deheija and Sharma 2009). The analysis of the taxonomy of heroine also finds its root in the paradigm of *prakriti* "nature" in search of *purusha* "ultimate being"; in the Hindu philosophy, *prakriti* is multicolored and multilayered, while *purusha* is singularly steadfast. Also, the common women of the town, of a lower social order, such as the wife of the gardener or the barber found a representation in poetry (Deheija and Sharma 2009).

A married woman, totally dedicated to her husband, is known as *Svakiya*. The poet (Lal) describes one such heroine who is ready for the pleasures of love which are akin to a war, and he says that *bhohan maror dhanu*, *baruni banaye baan* "her brows are bow, eye lashes her arrows" (Deheija and Sharma 2009). Another poet (Bhikharidas) gives a description of *navodha* "young, inexperienced heroine who is shy of

romantic pleasures" who tells her friend that *prabiin bade baldev ke bhaiyaa* "Krishna is very clever" – had I known his intentions, I would not have slept on his bed (Deheija and Sharma 2009). In the hands of courtly Braj poets, Lord Krishna has transformed into a metaphor used for a lover. The poet (Matiram) writes about *mugdha* "a heroine who is growing up from a child to a youth and who is more shy than romantic" who talks to her friend about her beloved and says *hon sakhii laajan Jaat mari* "I am embarrassed" as when people gather and talk, they insult him saying he has become my slave (Deheija and Sharma 2009). There is also a description of heroine who is unaware of the changes in her body, known as *ajnatyauvana*.

The poet (Nevaj) provides description of *madhya* "a heroine who has an equal measure of shyness and romance" who "wished to kiss her beloved came close to his lips, but said no when the beloved held her in his arms" *mukh chumban mein mukh le jo bhaje, piya ke mukh mein mukh naayo chahe* (Deheija and Sharma 2009). The poet (Mansinh Dvijdev) describes *praudha* "a heroine who has lost her inhibition and is well versed in the arts of romance"; one such heroine's pleasure is reflected on her lotus-like reddened face *phaili gayo raag mukh-pankaj lalaam par* (Deheija and Sharma 2009). Quite surprisingly, a derogatory and abusive term for a woman, i.e., *kulta* "a heroine who makes illicit love-relationship with many men," also finds an expression in Braj courtly poetry. The poet (Thakur) gives a description of *parakiya* "a heroine who is married to one but loves another man," and the description goes like this: the heroine responds to a friend who is counseling her on issues of morality – *ab kaa samajhaavati, ko samjhe, badanami ke bijan boi chukii rii* "why are you counseling me on ethical conduct now that I have already sown seeds of ill reputation?" (Deheija and Sharma 2009).

Also, there is description of other heroines, such as *gupta* "a heroine who hides her love for her beloved"; *vidagdha* "a heroine who cleverly sends signals of her love to her beloved"; *lakshita* "a heroine whose love has been made public"; *anushayana* "a heroine who is distressed and falls asleep while waiting for her beloved to

arrive”; *mudita* “a heroine who is excited when her beloved comes unexpectedly”; *samanya* “a heroine who is free with her love and is involved with many men”; *anyasambhogdukhita* “a heroine who is saddened when she sees marks of love caused by another woman on her beloved”; *garvita* “a heroine who is proud of her beauty and her love”; *manvati* “a heroine who finds her beloved guilty and feels angry”; *pro-shitapatika* “a heroine who is saddened when she hears that her beloved is going abroad on business”; *kalahantrita* “a heroine who fights and insults her beloved but who repents after he has left”; *khandita* “a heroine who is jealous when she sees her beloved return in the morning after he has spent the night with another woman”; *vipralabdha* “a heroine who is distressed when her beloved does not come to the appointed tryst”; *utkanthita* “a heroine who expectedly waits for her beloved”; *svadhinapatika* “a heroine whose beloved is totally dedicated to her”; and *abhisarika* “a heroine who leaves her home in the middle of the night, ignoring various perils, to meet her beloved”(Deheija and Sharma 2009).

Breathing

Paul Larson

The Chicago School of Professional Psychology,
Chicago, IL, USA

The use of the breath in spiritual practice has a long history, and the metaphor of the breath as a symbol for life is equally long standing. First let us note its strong association with life itself. We now know that there are heartbeats and brain function in the womb, but before that knowledge, we knew that taking in a breath was one of the first things we did as we are born. Our airway was cleared, the cord cut, and then we cried out. It is also the last thing we do as we die; we expire, literally. So the Egyptian glyph for life was an airway and the lung, the word in Hebrew for the life spirit is “nefesh,” the ancient Greeks termed the life force, “pneuma,” and in Sanskrit “prana” is also a term linking breath and life.

A basic limb of yoga as laid out by Patanjali was pranayama, the discipline of using the breath as a spiritual practice. Anyone who has practiced hatha yoga knows how intimately the breath is connected with the ability to stretch the body into the postures, or asanas. Different styles of breath are used for different purposes. Alternate nostril breathing has a purifying effect, the breath of fire, short rapid breaths is an energizer, and so on. Likewise most of the Asian forms of martial arts make great use of breath control to enhance the power of blocks, punches, or kicks. A standard technique in Western stress management techniques is diaphragmatic relaxing breath. It is among the most useful techniques since it can be done relatively unobtrusively.

As any singer or orator knows, breath support and breath control is essential in performing long phrases whether chanted, sung, or spoken. So indirectly, breath control is implicitly involved in a wide range of other spiritual practices. In short, the breath is a foundational skill in a wide range of human activities, many of which are directly or indirectly spiritual in nature, and the breath has an obvious association with life itself. In Western

psychology, diaphragmatic breathing is taught as a relaxation and stress management technique (Everly and Lating 2002). Similar approaches are used in a variety of voice training (speaking or singing) and in many of the martial arts. Thus, the ability to effectively use the mechanisms of breath has importance as a clinical tool and for effectiveness in a variety of recreational activities. The breath as both involuntary capacity to sustain life and as a voluntary tool is a vital part of psychology and spirituality.

Bridget of Ireland

Pamela Cooper-White
Union Theological Seminary, New York,
NY, USA

Two female figures share the name Brigid, the Christian Saint Brigid of Kildare, Ireland, in the fifth to sixth centuries CE (in Gaelic, Naomh Brid or Mary of the Gael) and the ancient Celtic goddess “Brigid.” The name, whose root means “power” or “exalted one,” has many variations throughout northern Europe including Bride, Brigit, Bríd, and others. Different was St. Birgitta of Sweden, whose name is sometimes anglicized as “Bridget.” Birgitta was a fourteenth century abbess, and is not associated with Brigid of Ireland or the ancient Celtic goddess.

Celtic Goddess Brighid

Brighid’s lore and ritual practices are said to extend back to Neolithic times. She was associated in Celtic and Irish mythologies with two primal elements necessary for life including fire (Breo-saighit, “fiery arrow”) and wells of healing water. As goddess of fire or keeper of the sacred flame, she was associated with both bonfire and hearth, craftsmanship (especially forging and smithy), and therefore also weapons and warcraft. In one story she forged the whistle (a staple of Celtic music) as a means of communication across great distances, or even night travel. Like the Roman goddess Vesta, she was the keeper of a sacred eternal flame that was tended by her virgin priestesses. In Jungian thought (Jung 1959/1990, para. 288), fire is a symbol of numinous divine power and bright consciousness coming through her, as in the pillar of flame in the Exodus story, the image of Christ as the “Light of the World” in the Gospel of John, and the tongues of flame over the disciples at Pentecost. A full-page painting by Jung (2009) in *The Red Book* (p. 155) similarly shows a shower of flames pouring down on a white-robed figure of the Anima, also named Sophia and Sapientia (Wisdom) in the accompanying text.

As goddess of wells, Brighid was further associated with healing, natural springs, magical groves, and highlands (reflecting her exalted nature). Pilgrims to this day dress trees near the sacred wells with strips of decorative cloth (“cloodies”) that have first been dipped in the well water and then tied to a branch while praying for healing – both physical and psychological/emotional. As the cloths disintegrate over time, they believe the illness or injury will fade away. Votive offerings of metal – coins, pins, or religious medals – are sometimes also left at holy wells.

Brighid was revered as a goddess of wisdom, intelligence, poetry, and healing. In Cormac’s earliest description, she appears as three sisters with the same name – a triple or triune goddess. A later version of her myth states that she had two sides to her face, one ugly and the other beautiful. These

images both hold Brighid in highest esteem in the Celtic pantheon as a goddess of comprehensiveness and transcendence. In Jungian terms, she can be seen as an archetypal figure with multiple functions, and as the Anima (female principle or soul), or even in light of her poetry, the figure Sapientia (Wisdom) and a source of healing.

Brighid's feast was the fertility festival Imbolc (Gaelic, referring to the pregnancy of ewes, or sheep's milk), celebrated at the beginning of spring. While dates vary in different cultures and hemispheres, in Europe it falls on Feb. 1 or 2 – the halfway point between the winter solstice and the vernal equinox. In analytical and transpersonal psychology, this link to cosmic events is seen as a psychological bond between humans and transcendent powers. As a goddess of fire, her feast was also associated with festivals of light marking the first lengthening of days, such as the folk tradition of Groundhog Day (which also included rites of fertility for the coming season, hearthfires and bonfires, and prognostication of good weather). Her role in nature religion was to draw the numinous sacredness of fertility, warmth, and helpful weather down from the heavens. Similar rituals were incorporated into the feast of Candlemas (recast with scriptural meaning in the Christian liturgical calendar as "The Presentation of Jesus in the Temple," or "The Purification of the Virgin"). Candlemas represents the culmination of the Christian season of epiphany with a ritual blessing of candles in procession, and imagery of the light of Christ coming as a psychological sign of hope in the midst of darkest winter. Brighid's feast itself also came to be the Feast of St. Brigid of Kildare (Fig. 1).

Saint Brigid of Kildare

Here Brigid was one of the earliest saints in Ireland, although her exact dates are uncertain (sometime between 452 or 456 and 524, 526, or 528) and her three early biographies do not agree in a number of details. She was the first Irish saint to be the subject of a Vita (biography), written c. 650 by a monk of Kildare who signed his name as "Cogitosus." Two biographies followed in the

Bridget of Ireland, Fig. 1 St. Brigid of Kildare, Ireland, holding her cross and fire (Public domain <http://www.st-brigids-gisborne.org.au/stbrigid.htm>)

seventh and ninth centuries, and the earliest Vita of St. Patrick was modeled on Cogitosus' Vita Sanctae Brigidae. While Patrick is better known as the "patron saint of Ireland," scholar Lisa Bitel (2001) points out that it was Brigid, not Patrick, who was native born, and she accomplished miracles, planted churches, and in earlier times was venerated as Patrick's equal. Her name, as well, established a link in the imaginations of the Irish people with the goddess Brighid, and her legend and cult often echoed psycho-spiritual themes, symbols, and ritual practices associated with the indigenous cult of the goddess. For example, Brigid's cross, a simple cross of braided rushes which Brigid allegedly made to convert a neighboring Chieftain to Christianity on his deathbed, hearkened back to a talisman from much earlier times. It was hung in kitchens and on front doors on St. Brigid's feast as a protection against fire and evil. Thus the veneration of St. Brigid is in many ways continuous with the worship of the goddess Brighid, and an example of psycho-religious syncretism (Fig. 2).

Bridget of Ireland, Fig. 2 Bridget of Ireland's braided Cross (Public domain <http://saintdunstansdenver.blogspot.com/2010/02/feast-february-1-saint-brigid-of.html>)

Extrapolating from multiple early (and at times conflicting) sources, Brigid was born to Broicsech/Brocca, a slave woman, and Broicsech's master Dubthach, a chieftain in the Kingdom of Leinster. She learned cattle and dairy farming from her mother. As a child, Brigid began miraculously multiplying foods to give away such as butter for the poor, and milk for bishops. When she began giving away some of Dubthach's possessions, he tried to sell her into slavery with the King. While her father was having this discussion with the King, she gave away his sword, causing the King to recognize her holiness and grant her mother's freedom. In another version of the story, the pregnant Broicsech was sold at the insistence of Dubthach's wife to a Druid. The infant Brigid astonished the Druid by sending columns of flame out of her head (again, being depicted like the saint before her as a channel of numinous power). After witnessing more of the girl's miracles – patterned after Jesus' transformation of water into wine (in her case, bathwater into beer) and multiplying the loaves and fishes – the Druid converted to Christianity and freed her mother from slavery.

Like many young women, Brigid chose to join a convent rather than to be handed off in marriage. (In one story, she prayed for an infirmity to make her unmarriageable, and her eye burst open, only to heal again once she took the veil.) She joined

seven other young women to form a religious community beneath an oak tree, naming the place "Kildare" (Cill Dara, "the church of the oak"). She won over St. Macaille's support to request holy orders. In another account, after humbly placing herself last in line to receive the veil, she was called forward by Bishop Mel when he saw a pillar of fire rising from her head. In recognition either of her piety or her authority, and possibly over St. Macaille's objections, Bishop Mel was said to have read the words of consecration for a bishop over her. She became abbess of the first convent in Ireland at Ardagh, a position in many ways equivalent to the Irish bishops of the time, developed a monastic rule of life, and drew numerous followers. Based on one bishop's vision, she was even thought to be an embodiment of Mary ("Mary of the Gael" or Mary of the Celts). In Jungian terms, Brigid's charismatic power and leadership show her ego's being saturated with the sacred power of the divine self. In more Adlerian or existential terms, she may also be seen as an actualization of the will at a high stage of personal development.

As time went on, she began traveling throughout Ireland, visiting churches, and establishing convents. In some accounts, she made three great journeys across the entire isle, and was a close spiritual companion to St. Patrick. She gained a reputation for performing miracles of generosity, healing, and even preventing crimes and mediating peace among enemies. In one story, she rescued a woman falsely accused of theft by producing the allegedly stolen brooch from a fish, saving her from a life of enforced slavery. It was also reported that she miraculously caused a pregnancy in one of her nuns to disappear, thus restoring the woman to the community. She established several communities of religious women, and eventually settled a double abbey for both women and men in Kildare by recruiting the anchorite Conlaed to bring his monks there (thus providing the sacrament for the community). Kildare was already a site sacred to the goddess Brighid, and Gerald of Wales reported in the thirteenth century that a sacred fire – kept apart from men by both hedges and a curse – was still perpetually maintained by the nuns. In one legend,

the King of Leinster offered her as much land as her cloak would cover. Miraculously, the cloak stretched out across the entire grazing plain of Curragh, and there the community established its living. The abbey was a notable center of learning, teaching, medicine, and art. Its illuminated manuscripts were widely admired – including one elaborate “Book of Kildare” cited in early sources but later lost or destroyed. She followed the Celtic practice of having a soul friend (*anam cara*), and this younger nun Darlughdach was both an intimate companion and a public representative. After her death, Kildare grew in popularity as a pilgrimage site, and later abbesses continued to wield influence in matters of government throughout Ireland. Some of her relics were buried with those of St. Patrick and St. Columba at Downpatrick. Together, these three are revered as Ireland’s greatest saints. In Jungian terms, they might be viewed as a trinity of masculine and feminine principles, whose combined influence both drew from and contributed to the growth of the sacred in the collective unconscious.

Brigid’s reputation grew after her death through stories of posthumous miracles. In one, a boulder on a high mountain could not be moved by human effort, but she caused it to tumble to the exact spot where it was needed as a millstone. Her association with the goddess Brighid also grew. The stories of flames issuing from her head echo the goddess’ association with fire, and St. Brigid also came to be venerated at holy wells. She is often depicted with a cow or other animal sacred to the goddess lying at her feet as a symbol of abundance. Moreover, her feast day coincides with Imbolc (beginning of spring) – perhaps as an effort on the part of the church to absorb or replace the cult of the goddess, or perhaps in a more syncretist approach (conscious or unconscious), to enhance St. Brigid’s holy reputation through a conflation of the two (see ► [Syncretism](#)). Whatever the motives of the early church leaders, Brigid is venerated to this day as a holy female figure associated with the fires of home and industry, waters of healing, and the hope for the return of light and abundance with the coming of spring, and may be seen as representing the

psychological dimensions of ego strength, growth, hope, and wellness.

Brief Counseling

Kelvin F. Mutter

McMaster Divinity College, Hamilton, ON,
Canada

“Brief counseling” refers to a group of therapeutic practices and modalities that include solution-focused therapy (De Jong and Berg 2002; Walter and Peller 1992), narrative therapy (Freedman and Combs 1996; White 2007), single-session therapy (Slive and Bobele 2011; Talmon 1990), as well as models of brief pastoral counseling (e.g., Benner 2003; Childs 1990). While there are clear differences between these counseling approaches, these modalities have in common the fact that they are focused, collaborative, competency oriented, and time limited.

Solution-Focused Therapy

Solution-focused therapy (SFT), pioneered by Steve de Shazer, Insoo Kim Berg, and their associates, targets the desired outcome of therapy (i.e., solution) rather than focusing on symptoms or issues (De Jong and Berg 2002). Walter and Peller (1992) identify 12 assumptions that guide the solution-focused approach:

1. Change is facilitated by focusing on the positive, the desired solution, and the future.
2. Change occurs when the counselor and counselee are able to identify and build on exceptions to the problem.
3. Change is constant; nothing remains the same.
4. Small changes lead to larger changes.
5. Change is a cooperative or collaborative process in which the counselee provides the required data and the counselor takes the counselee at their word.
6. People are resourceful and capable of acting in ways that result in change.
7. People make meaning of their lived experience. Therefore, a change in meaning is connected to changes in a person's experience.
8. Actions and descriptions exist in a circular relationship, i.e., we experience what we see.
9. The meaning of a message given is understood by the response received.
10. The client is the expert.
11. Change in one part of the counselee's life (e.g., goal, behavior, meaning) creates change in other parts of their life.
12. The treatment group is comprised of those who share the goal and desire to achieve that outcome. The positive and collaborative orientation of these assumptions illustrates that SFT focuses on the construction of new behaviors, meanings, and possibilities rather than the identification and alleviation of a problem or pathology.

Solution-focused counselors use the basic counseling skillset, e.g., attending, listening, empathizing, questioning, echoing, summarizing, paraphrasing, normalizing, and use of silence (De Jong and Berg 2002). Solution-focused counselors also employ interventions that support the process of change, e.g., exploring meaning, identifying exceptions, the miracle question, scaling questions, and the EARS technique (De Jong and Berg 2002). Reviews of the research literature relating to the practice of SFT indicate that while there are methodological weaknesses in some

studies, the research supports the use of this model (Bond et al. 2013; Gingerich and Peterson 2013). Two types of pastoral counseling models reflect the influence of solution-focused therapy on the work of pastoral care and counseling: approaches that are informed by but not dependent on SFT (e.g., Stone 1984) and approaches that are aligned with the methods and the assumptions of SFT (e.g., Kollar 2011).

Narrative Therapy

Narrative therapy works with the principle that the way we view and understand our lives is communicated in the stories we tell. Freedman and Combs (1996) identify four postmodern ideas that inform the practice of narrative therapy, i.e., realities are socially constructed, realities are constituted through knowledge, realities are organized and maintained through narrative, and there are no essential truths. In practical terms, narrative therapy recognizes the distinct roles of four types of stories, i.e., the dominant story, the problem story, the subordinate story, and the alternative story (Freedman and Combs 1996; White 2007). The dominant story emerges over a period of time, focuses on particular events or experiences, and is used to define a person's identity or sense of self. The problem story refers to a specific type of self-narrative that is dominated by problems and which constrain a person's life. Left unchallenged, these problem stories can become the dominant story. The subordinate story refers to those overlooked but vital aspects of a person's life narrative which may be useful for reshaping a person's understanding of themselves and others. Lastly, the alternative story refers to a new life narrative that forms around the subordinate story and historically unique outcomes (i.e., exceptions to the dominant story).

Key assumptions that inform the work of narrative therapy include the following beliefs: the problem (not the person) is the problem, people have expertise on their own lives, people can become the primary authors of the stories of their own lives, and people possess the self-agency and self-efficacy to change as evidenced by the

presence in their life narrative of exceptions to the problem story (Freedman and Combs 1996; White 2007). Those who practice narrative therapy seek to understand the counselee's experiences, collaborate with the counselee to promote a heightened sense of agency, as well as avoid predictions, interpretations, and pathologizing. Narrative therapy combines the basic counseling skillset (e.g., attending, observing, paraphrasing, giving feedback, clarifying, directing, questioning, etc.) with practices that are specific to this counseling model. These practices include externalizing the problem, identifying unique outcomes, mapping stories, thickening the alternative story, re-authoring conversations, remembering conversations, and "scaffolding" (Freedman and Combs 1996; White 2007). The published research on narrative therapy includes, but is not limited to, the use of this model with adults diagnosed with major depression (Vromans and Schweitzer 2011), its use with young people with autism (Cashin et al. 2013), and its use with women who have experienced domestic violence (Bullen 2015). Pastoral counseling texts that reflect the influence of narrative therapy include models that use specific elements such as "externalizing" (e.g., Kollar 2011) and articles that explore the use of narrative therapy within pastoral practice (Bayoli 2012; Bloos and O'Connor 2002).

Single-Session Counseling

The practice of single-session counseling recognizes that not every counselee desires or is able to commit to ongoing counseling and that not every problem requires ongoing counseling (Slive and Bobele 2011; Talmon 1990). Those who practice single-session counseling observe that the statistical mode for the number of counseling sessions is one (Slive and Bobele 2011). As a result, they make the case that those who counsel need to have the mindset that they only have one session with each counselee (Slive and Bobele 2011; Talmon 1990). This mindset includes several key beliefs: single-session counseling is not long-term counseling condensed into 1 h; the clearer the focus, the briefer the counseling; each session is

a consultation; satisfactory conclusions may be reached within 1 h; and that clients possess insights, competencies, and resources they can access to create change (Slive and Bobele 2011; Talmon 1990). Single-session counselors recognize that there are times when the presenting issue is not resolved within an hour and refer people to additional services offered by the service provider or within the community (Slive and Bobele 2011).

The goal of single-session counseling is to provide people with accessible service that facilitates their ability to resolve or cope with a specific challenge. In addition to the use of the basic counseling skillset that is common to most therapeutic models, the practice of single-session counseling seeks to answer the following questions: “What does the counselee want today?” “What is the background to this problem?” “What are the counselee’s resources?” “What solutions have they attempted?” and “What is the counselee’s theory of change?” (Slive and Bobele 2011; Talmon 1990). Other characteristics of single-session counseling include an attitude of collaboration, “thinking small,” making use of the counselee’s motivation, and co-creating an action plan for the counselee (Slive and Bobele 2011). Research on this model remains undeveloped with recent publications noting a need for studies that advance our understanding as what makes single-session counseling effective and how this way of working can be improved (Campbell 2012). At the present time, Kacela’s (2003) article on counseling African American families stands out as the one identifiable example of pastoral care and counseling that incorporates a single-session perspective.

In summary, the term brief counseling is descriptive of any counseling approach that is focused and time limited. Methodologically, models of brief counseling are collaborative, strength based, client empowering, and oriented toward the present. Within these models, the counselor tends to view themselves as a facilitator of change rather than an expert who possesses special knowledge. These characteristics commend the practice of brief counseling to spiritual care professionals, clergy, etc., as these counseling models are readily adapted to the limitations

of resources, time, and training encountered by the religious vocations.

Buber, Martin

Maurice Friedman
San Diego State University, Solana Beach,
CA, USA

Martin Buber (1878–1965) had a highly significant impact both on the religious thought of his time and on the theory and practice of psychotherapy.

The foundation for both of these contributions was Buber's early and later lifelong concern with Hasidism – the popular communal mysticism of the Jewry of Eastern Europe that arose with Israel ben Elieazer (the Baal Shem Tov) (1700–1760). In his lifelong work on Hasidism, Buber moved from the fuller stories of his youth, such as *The Legend of the Baal Shem*, to the much shorter tales of the Hasidim – “legendary anecdotes.” When in 1948, the great German-Swiss novelist Hermann Hesse nominated Buber for a Nobel Prize in Literature, he claimed that by his tales of the Hasidim, Buber had enriched world literature as had no other living person. Buber also wrote *For the Sake of Heaven*, his Hasidic chronicle-novel and the little classic *The Way of Man According to the Teachings of the Hasidim* plus essays on Hasidic life and community that were collected and published in English translation in *Hasidism and the Modern Man* and *The Origin and Meaning of Hasidism*. In Hasidism Buber found a great

emphasis upon *kavana* – dedication, devotion, and inner intention. Accompanied by a life of action for man and God best expressed in the phrase “hallowing the everyday,” Buber was not himself Orthodox and observant. This led many to criticize Buber for his failure to emphasize in the tales *halakhah* – the Jewish law – including his friend Abraham Joshua Heschel, a scion of Hasidism who was directly descended from some of the great Hasidic *zaddikim*. Once, however, when someone suggested to Buber that he free Hasidism from its confessional fetters as part of Judaism, Buber replied, “I do not need to leave my ancestral house to speak a word that can be heard in the street. I brought Hasidism to the Western World against the will of the Hasidim themselves.”

Although there were many things in Judaism that Buber could not accept, he felt that in the Hebrew Bible, more than anywhere else, there appeared the dialogue between God and man; it was to biblical Judaism and not to the rabbinical Judaism that succeeded it that Buber gave his full attention. He translated the Hebrew Bible into German with his friend Franz Rosenzweig, until Rosenzweig's death in 1929, emphasizing the “cola” or breathing units of the text. “Do we mean a book? We mean a voice,” he said.

God does not ask for “religion” but for community. Buber unfolded his view in a series of important biblical interpretations: *The Kingship of God* (from the beginning of the covenant with Israel, God makes the absolute demand of bringing all of life in relation to him), *Moses* (here Buber replaced source criticism by “traditional criticism”), *The Prophetic Faith*, and *Two Types of Faith*, in which Buber contrasted the *emunah*, or trust in relationship, of the Hebrew bible, Jesus and the Hasidism with the *pistis*, or faith based on a knowledge proposition that characterized Paul and many Christians who followed him.

Buber's philosophy of dialogue with the eternal Thou that is met in each finite Thou did, however, speak in universal and not just Jewish terms. Buber saw God as the “absolute Person” who is not a person but becomes one to know and be known and to love and be loved by us. We can dedicate to the absolute Person not only our personal lives but also our relationships to others.

Buber moved from the actual event – the “lived concrete” – to symbol and myth. Countless concrete meetings of I and Thou have attained expressions in the relatively abstract form of myth. It is just this that gives these myths their universality and profundity and enables them to tell us something of the structure of human reality that nothing else can tell us. The that can only be met as a Thou. “Love is the responsibility of an I for a Thou.”

Buber was a philosophical anthropologist as well as a religious and community socialist. His teaching of the “life of dialogue” influenced many fields of thought that are not in themselves religious, such as sociology, education, psychology, and psychotherapy. Basic to these fields of thought was the dialogue between person and person and not between God and man. A German book has appeared entitled (in English translation) *Buber for Atheists!*

In psychotherapy, as in teaching and in the relationship of pastor and congregant, Buber spoke of “a normative limitation of mutuality.” This limitation did not mean the I-It relation but a one-sided I-Thou in which the therapist or teacher “imagines the real” makes the other person present in his or her uniqueness. No such seeing the other side of the relationship is possible for the patient or pupil. Yet the patient is not, to Buber, the subject of a psychoanalysis but of a “psychosynthesis,” to use the term that Buber shared with the Italian therapist Roberto Assagioli. Buber’s concern was the whole person who made decisions out of the depths of his or her being rather than with the conscious rational mind alone. “Inclusion,” or imagining the real, is the essential first step to making the other present, and making the other present in his or her uniqueness is the essential step to “confirmation.” Confirmation, to Buber, did not mean merely accepting or affirming the person. It could indeed include confrontation and wrestling with the other. “The inmost growth of a person does not occur, as people like to suppose today, through one’s relation to oneself but through being made present by another and knowing that one is made present.”

Buber’s influence was not confined to individual one-on-one psychotherapy. It also affected

group therapy and that “contextual” or intergenerational family therapy that was founded by Ivan Boszormenyi-Nagy, M.D. In such therapy, the adult children come to understand the childhood of their parents while avoiding “parentifying” their own children. So here the central statement of *I and Thou* – “All real living is meeting” – is applied to the relationship between person and person within the family or outside of it without any explicit reference to an I-Thou with the eternal Thou.

In 1957 the Washington (DC) School of Psychiatry brought Buber to America to give the Fourth William Alanson White Memorial Lectures on “What Can Philosophical Anthropology Contribute to Psychiatry.” The lectures that Buber gave then brought together into one whole (now published in Buber’s book *The Knowledge of Man*) the various strands that have before and since served as the groundwork for all dialogical psychotherapy.

The *between* is the ontological dimension in the meeting between persons, or the “interhuman” (not to be confused with the “interpersonal which includes I-It as well as I-Thou!”) that is usually overlooked because of our tendency to divide our existences into inner and outer, subjective and objective *dialogue* is the way through which we relate to others in their uniqueness and otherness and not just as a context of our experience. The intrapsychic is only the accompaniment of the dialogue and not as so many psychologists tend to see it, the touchstone of reality in itself. Underlying the I-Thou as also the I-It is the twofold movement of “setting at a distance” and “entering into relation” (*distance and relation*).

Essential in psychotherapy when it is a question not of some repair work but of restoring the atrophied personal center is “healing through meeting.” Corollary to this is the fact that Buber saw the *unconscious* as the wholeness of the person before the differentiation and elaboration into psychic and physical, inner and outer. Buber felt that Freud and Jung and all other psychologists missed because of the logical error that if the unconscious is not physical, as many claimed, then it must be psychic. The unconscious can only be grasped dynamically and in process and

not as some sort of fixed object. Buber particularly wanted to guard against that “psychologism” that removes reality and the meeting with others into the intrapsychic so that life in the soul replaces life with the world. Jung saw religion as psychic events that take place in relation to the unconscious and God as an autonomous psychic content, a function of the unconscious. “Otherwise,” wrote Jung, “God is not real for he nowhere impinges upon our lives.” Psychology becomes in Jung the only admissible metaphysics. The fiction of the world in the soul conceals the possibility of a life with the world.

Existential guilt is an event of the between, something that arises from the sickness between person and persona and that can be healed only through illuminating the guilt, persevering in that illumination, and repairing the injured order of existence through an active devotion to it. Existential guilt is an ontic dimension that cannot be reduced to inner feelings or the introjection of the “superego.” This put Buber at variance with Freud who saw guilt as only neurotic and Jung who saw guilt as one’s failure to achieve individuation. Neither saw guilt as a reality of the human person in relation to the reality entrusted to him or her.

Therapy too rests on the I-Thou relationship of openness, mutuality, presence, and directness. Yet it can never be fully mutual. There is instead what Buber called “a normative limitation of mutuality” that applies to the therapist, the teacher, the pastor, and, of course, the parent. There is mutual contact, mutual trust, and mutual concern with a common problem but not mutual inclusion. The therapist can and must be on the client’s side and, in a bipolar relationship, must imagine quite concretely what the client is thinking, feeling, and willing. The therapist cannot expect or demand that the client practice such inclusion with him or her. Yet there *is* mutuality, including the therapist’s sharing personally with the client when that seems helpful.

Inclusion or “imagining the real” must be distinguished from the empathy that goes over to the other side of the relationship and that identification that remains on one’s own side and cannot go over to the other.

Confirmation comes through the client being understood from within (by parents, family, friends, and lastly through the therapist) and through the therapist going beyond this to that second stage in which the demand of the community is placed on the client. This demand enables the client to go back into dialogue with those from whom he or she has been cutoff. Buber saw inclusion, or making the other present, as anything but passive or merely receptive. It is rather a “bold swinging” into the life of the other where one brings all one’s resources into play.

Bucke, Richard

Charlotte Moore
West Chester University of Pennsylvania,
West Chester, PA, USA

Life and Career

Richard Maurice Bucke (1837–1902) was a Canadian psychiatrist who published a detailed investigation of a particular type of religious

experience that he named cosmic consciousness, which he believed to be the next evolutionary step for humanity. Bucke was raised on a farm in Ontario, Canada, and is reported to have had very little formal education as a child (Bucke 1991, p. i). He left Canada to explore the United States at age 17, where he worked odd jobs (including silver mining) until age 21, when he returned to Canada to attend McGill Medical School (Bucke 1991, p. ii). During his professional career, he served as a Professor of Mental and Nervous Diseases at Western University in London, Ontario (Bucke 1991, p. iii). His research into cosmic consciousness was inspired by an experience that he had in 1872 that conforms to several of the criteria outlined in his study (Bucke 1991, p. iii). His book, *Cosmic Consciousness*, was highly regarded by Williams James and P. D. Ouspensky and is considered by many to be a classic in the field of mysticism (Bucke 1991, p. viii).

Stages of Consciousness

Bucke suggests that there are four distinct stages of consciousness, which grow out of one another as an evolutionary process. The first stage is the perceptual mind, which is characterized by *percepts* or sense impressions (Bucke 1991, p. 12). Any organism that is capable of sense perception has access to this mode of consciousness. Repeated exposure to objects in the environment with similar patterns, such as varieties of trees, eventually causes a neurophysiological advancement that enables the organism to evolve to a state of simple consciousness, which is characterized by *recepts* or composite images of thousands of *percepts* (Bucke 1991, p. 13). It could be understood as a basic form of pattern recognition. Simple consciousness is the mode of consciousness that both humans and nonhuman animals engage in. Bucke suggests that the evolutionary drive eventually necessitates greater efficiency, at which point *recepts* must be named, or “marked with a sign,” which leads to concepts and language (Bucke 1991, p. 14). Self-consciousness, this third stage, is therefore characterized by

conceptual, abstract thinking, and the ability to identify objects, concepts, and mental states – including the concept of self – as objects for one’s consciousness (Bucke 1991, p. 1). The next evolutionary step, or fourth stage, is *intuition*, which is characteristic of cosmic consciousness. Bucke explains, “This is the mind in which sensation, simple consciousness and self consciousness are supplemented and crowned with cosmic consciousness” (Bucke 1991, p. 16). Bucke suggests that one can witness how these stages grow out of one another by observing the development of a human from birth to adulthood. While most adults (he categorizes those who do not) fully participate in self-consciousness, or self-conscious awareness, humans have yet to fully evolve the capacity for cosmic consciousness, which Bucke suggests is the next evolutionary stage.

Characteristics of Cosmic Consciousness

Bucke sets forth a number of criteria that are characteristics of cosmic consciousness and then reviews a number of case studies that exhibit these criteria. These criteria or “marks” of cosmic consciousness include (a) an intense flash of light, sometimes described as a sense of “being immersed in flame” (Bucke 1991, p. 72); (b) an emotion of “joy, assurance, triumph, ‘salvation’” or the sense that no “salvation” is needed (Bucke 1991, p. 73); (c) an “intellectual illumination” in which an intelligible order to the universe is directly apprehended (Bucke 1991, p. 73); (d) a sense of immortality (Bucke 1991, p. 74); (e) fear of death vanishes (Bucke 1991, p. 74); (f) escape from the concept of sin (Bucke 1991, p. 74); (g) an instantaneousness of illumination (Bucke 1991, p. 75); (h) strong moral character as a prerequisite to the attainment of cosmic consciousness (Bucke 1991, p. 75); (i) age of illumination is generally between 30 and 40 years of age (Bucke 1991, p. 75); (j) an increase in charm, charisma (Bucke 1991, p. 75); and (k) transfiguration or an increase of visible light either within or surrounding the individual who has attained cosmic consciousness (Bucke 1991, p. 75).

Examples of Cosmic Consciousness

In *Cosmic Consciousness*, Richard Bucke investigates a number of case studies of individuals who have achieved cosmic consciousness by closely examining their writings, teachings, and life stories and assessing to what extent they conform to the above criteria. The individuals considered include the historical Buddha, Jesus, Paul, Plotinus, Mohammed, Dante, St. John of the Cross, and Walt Whitman. The third part of the text examines those who Bucke suggests had an initial experience of illumination, but did not fully integrate and sustain the state of cosmic consciousness. Included in this latter category are Moses, Socrates, Benedict Spinoza, William Wordsworth, and Ramakrishna, among others.

Possible Criticisms

Although the criteria outlined in *Cosmic Consciousness* form the basis for further investigations into this particular type of religious experience, the study is limited in terms of its appreciation of ethnic diversity. Bucke's claim that there are more cases of cosmic consciousness among males than females also suggests a possible gender bias that could be further explored (Bucke 1991, p. 65). These biases are most likely related to the era in which Bucke was writing but are here mentioned for the sake of a more complete understanding of both his particular study and for the area of investigation it opens up.

Buddha-Nature

Trish O'Sullivan

Kwan Um School of Zen, Psychotherapy,
New York, NY, USA

Buddha-nature is a teaching of the Buddha regarding the true nature of self. After attaining enlightenment, the Buddha stated that all beings have Buddha-nature. Propagated in the Mahayana School especially, the teachings espouse that all sentient beings possess a True Self that is unconditioned, undefiled, indivisible, and timeless. This True Self or Buddha-nature is beyond the realm of ordinary consciousness, and practitioners must transcend ordinary conceptual thought (usually through meditation) in order to perceive it. While it is said that Buddha-nature is to be attained through meditation, it is also emphasized that everyone already has it and the process is one of piercing conceptual ignorance and uncovering something that is already there. The experience of attaining Buddha-nature is realization or enlightenment.

The realization of Buddha-nature brings with it a cessation of overidentification with the body, emotions, and mental processes. This results in release from samsara or suffering related to attachment to the idea of a separate self and the related grasping and aversion that results from that idea.

Buddha-nature contrasts with the idea of the self as the essence of individuality in that with the realization of Buddha-nature, all notions of individuality and separateness become less fixed. Psychologically this concept of interconnectivity and nondistinction from all sentient beings, since all beings have the same Buddha-nature, is a perspective that decreases isolation and brings compassion, understanding, and peaceful practices such as ahimsa or nonharming. It can also diminish the fear of death and other forms of insecurity.

From the psychotherapeutic perspective, the experience of being viewed by the

Buddhist therapist as someone who is ultimately undamaged and has the capacity for attaining enlightenment and full Buddhahood is a positive one. Many Buddhist authors and therapists encourage psychotherapy clients to meditate in order to diminish attachment to negative emotions and situations. This can reduce suffering while the client works through their issues and is a valuable skill useful throughout life.

Buddha-nature is not something that can be adequately explained with words but must be experienced for complete comprehension. Within Buddhism there are many teaching tools that point to Buddha-nature rather than attempt to explain what it is. The following is a traditional Chinese Zen poem of unknown authorship pointing to Buddha-nature:

The Human Route
Coming empty-handed, going empty-handed-
That is human
When you are born, where do you come from?
When you die, where do you go?
Life is like a floating cloud which appears.
Death is like a floating cloud which disappears.
The floating cloud itself does not exist.
Life and death, coming and going are also like that.
But there is one thing which always remains clear.
It is pure and clear, not depending on life or death.
Then, what is the one pure and clear thing?

Buddha-Nature of Insentient Beings

Shuman Chen

Northwestern University, Evanston, IL, USA

Throughout time, Buddhist teachings have been mainly sentience concerned or, more specifically, anthropocentric, aiming at an individual human's final liberation. In contrast to Theravadins who aim at arhatship, Mahayanists consider Buddhahood the final goal. As a result, the concept of Buddha-nature has been one of the central themes in Mahayana Buddhism. Over the course of its development on the Indian subcontinent to East Asia, the doctrine of "Buddha-nature" has been interpreted in at least four ways: (1) the inherent Buddha-nature as metaphysical principle is *present but concealed within* each sentient being; (2) intrinsically endowed with the true nature, all sentient beings *have always been* the enlightened ones, even if they might not be aware of this truth; (3) in terms of tathāgatagarbha, everyone has Buddha seeds within and has the potential of *becoming* a Buddha; and (4) every sentient being is *assured of actually becoming* a Buddha at some future time. Apparently, these four definitions only apply to sentient beings. In contrast, the doctrine of insentient beings' Buddha-nature goes against the prevailing Mahayana belief in all sentient beings' inherent Buddha-nature and instead emphasizes that insentient things also possess this nature. The significance of this innovative theory continues to be a challenge to and a reflection on human capacity and self-understanding. Do human beings alone, among all living beings, have the privilege to engage in spiritual practice and achieve enlightenment? Do stones, water, and bricks reputed to be insentient have no feelings, sentiments, or mentality? In other words, is there a clear distinction or delineation between the "active, subjective" sentient beings and the "passive, objective" insentient world?

The doctrine of insentient beings emerged in early medieval China and aroused Chinese

Buddhist thinkers into further meditation on how to define and interpret Buddha-nature. By making creative use of the neologism “Buddha-nature,” Chinese Buddhists extended the universality of Buddha-nature to include insentient beings, which refer to inanimate objects without a nervous system. The idea that Buddha-nature is found in insentient beings assumed its embryonic form in Jingying Huiyuan’s (523–592) writing. Though not an advocate of this concept, Huiyuan posits that Buddha-nature, like space, pervades everywhere and all beings, including insentient objects. However, by dividing Buddha-nature into the knowing (the perceiver) and the known (the perceived), he argues that the insentient world shares with sentient beings the Buddha-nature that is known, which is equivalent to inconceivable emptiness, the middle-way, and dharma-nature, yet lacks sentient beings’ properties of knowing, i.e., consciousness, true mind, awareness, or wisdom of realization. As such, insentient beings’ Buddha-nature, for Huiyuan, is merely static and can be recognized only by sentient beings, whose Buddha-nature, in contrast, can either be concealed – like the full moon covered by clouds – or serve as the basis of practices allowing them to wake up from dreams of ignorance.

In the same spirit, Jiexiang Jizang (549–623), applying the principle of non-dual emptiness between sentience and insentience and between the organism and the environment, acknowledges the Buddha-nature of insentient beings. In addition, he stipulates that in the eyes of the Buddha, all is encompassed in his own perfection; therefore, once any sentient being attains Buddhahood, all sentient beings and plants also achieve the same state. On the other hand, he denies that insentient beings have a mind capable of eliminating delusion or cultivating good in actual experience. Hence, Jizang’s views should be considered theoretical and philosophical, but not practical or broadly applicable.

Among the Chinese Buddhist thinkers, Jingxi Zhanran (711–782) in the Tiantai School is the strongest advocate of insentient beings possessing Buddha-nature. He provides his rationale primarily from the perspective of the all-pervasive quality of Buddha-nature, which he considers

synonymous with suchness. This rationale indicates that external tangible objects like water, buildings, and flora, formless sounds and smells, and internal thoughts or ideas all possess Buddha-nature. This is because Shakyamuni Buddha and any other Buddha’s meritorious qualities in their practice leading to enlightenment and in the resultant realization do not reject anything, instead embracing all. In the Tiantai terminology, the Buddha and all beings mutually include, inter-pervade, and are identical to each other. Zhanran accordingly presents the reciprocal relationship between insentient beings and Buddha-nature in terms of four distinct claims: (1) insentient things “have” Buddha-nature, (2) insentient things “are” Buddha-nature, (3) insentient things “are replete with” Buddha-nature, and (4) insentient things “are identical to” Buddha-nature (Chen 2011). This mutuality also applies to the inseparable rapport between the sentient and the insentient. To promote his idea, Zhanran dedicates his final work, the *Jin’gangpi* (the *Diamond Scalpel*), to the contention that plants, land, tiles, and even the smallest particle of dust have the threefold Buddha-nature – the cause proper, which is the objective character of the truth to be realized in Buddhahood, and the conditioning and revealing causes, which are the experiential and behavioral concomitants of that realization. Moreover, according to Zhanran, insentient beings can partake in and accomplish the ultimate Way, a step further than Huiyuan’s and Jizang’s views regarding insentient beings’ capability of liberation.

Within the Chan tradition, Nanyang Huizhong (d. 775) and Dongshan Liangjie (807–869) are two examples who advocate the idea that nature is dharma-body and Buddha-mind, *per se*. It should nonetheless be noted that not all Chan masters hold the same view. Dazhu Huihai (Tang dynasty), Huangbo (d. 850), and Linji (d. 867), for example, restrict Buddha-nature to sentient beings that possess a mind, focusing on a vitalist notion of sentient “function.” Even if one concedes the point of Huizhong and Dongshan, one might argue that the concept of insentient beings’ Buddha-nature can merely be used as a *koan* (a critical word or phrase to ponder upon) to assist one on the path of practice. However, these two

Chan masters do not just deem the concept as a *koan*. Instead, they assert that each part of the world is constantly preaching the ultimate meaning that might trigger one's enlightenment in an instant moment if one bears in mind a non-discriminative understanding and is attentive to the "voice" of the entire world.

The doctrine of insentient beings possessing Buddha-nature began to circulate in Japan in the early ninth century. The first advocate of plants' Buddhahood was probably Kūkai (774–835), the founder of the esoteric Shingon School, although Saichō (766–822), the founder of the Tendai School, was the first to mention the Buddha-nature of trees and rocks (*mokuseki busshō*) in his writing. According to Kūkai's *Unjigi* (*On the Meaning of the Syllable Hum*), if one argues that plants have no Buddha-nature, it is as if one argues that waves do not have wetness. He contends that the three mundane worlds are the essence/body of the Buddha. The *samaya*, or the original vow of each Buddha, equally pervades all beings, including stones, trees, human beings, and animals. Kūkai further argues that plants also have consciousness – only discernable by opening one's Buddha eye – required for religious aspiration to liberation. According to his idea of "the dharma-body preaching the Dharma," the universe as the cosmic Buddha *Mahāvairocana* speaks to us.

Zen master Dōgen (1200–1253), like Kūkai, also asserts the non-duality between the sentient and the insentient and further refutes any contradictory conflicts between time and space, nature and form, dharma-nature (or even phenomena) and Buddha-nature, permanence and impermanence. Dōgen, therefore, questions the natural world's insentience and is critical of the belief that insentient beings *possess* or *symbolize* Buddha-nature, for this dualistic view would distinguish the samsaric, impermanent world from the Buddha (or Buddha-nature). Rather, he contends that all insentient beings *are* Buddha-nature, an argument reminiscent of Zhanran's views as previously stated. Moreover, in the *Shōbōgenzō*, Dōgen insists that Buddha's body and speech are found in the landscape, yet ordinary people only perceive the superficial aspects of the universe.

Echoing Huizhong, Dōgen maintains that mountains, rivers, plants, and stars as the (Buddha) mind are Buddhist scriptures and constantly illuminate the true Dharma in a nonhuman language, which should not be confused with human actions and needs to be pondered upon as *koans*.

The idea that insentient beings possess Buddha-nature, since its spread to Japan, has become deeply rooted there and was disseminated into medieval poetry and the Noh drama. Yet, it primarily centers on the Buddhahood of grass and trees, in contrast to the Chinese emphasis on the all-pervasiveness and indivisibility of Buddha-nature per se. On the one hand, the focus on plants provides a concrete example of *what* (not just *who*) can reach enlightenment. On the other hand, it risks implying that *only* nature can attain Buddhahood and that artificial objects are excluded. It also leads to a speculation that the theory of plants' Buddhahood is another form of animism. As viewed in the Noh dharma, banana trees, cherries, and moonflowers become Buddhas, and Noh playwrights frequently state, "The grass, trees, and land will all become Buddha" (Shively 1957).

As we have seen, the Chinese and Japanese views on the Buddha-nature of insentient beings are mostly grounded on the principle of non-duality, the (re)interpretation or (re)definition of Buddha-nature, and on the extent of what must be included in Buddha-nature or Buddhahood. Yet, the idea of the Buddha-nature of natural phenomena functions not only as a doctrine but also as a meditation technique whereby phenomena are viewed as direct expressions of ultimate reality, imparting an absolute value to all things. One possible way in which this doctrine can serve as the basis of a meditative practice is that the sentient meditator first has to be mindful of himself *being there* meditating and then let go of the strong sense of being there. In the next step, by welcoming the outside world (e.g., the meditation cushion, the room, the garden, the town, and the sky) to join him, the meditator becomes one with the world. Nonetheless, a two-way fluidity exists in the process of meditation; it is not only that one is a destination toward which myriad dharmas (i.e., all tangible and conceptual things) flow, but

also that one extends outward toward and resonates with each of the dharmas “outside oneself.” Following from the achievement of such two-way fluidity, the practitioner would realize that there is no one who invites the world, that there is no movement from without to within or from within to without, and that nothing has been invited or joined. The meditator finally realizes that from beginning to end, he has never been apart from the “outside” world. To sit there is to be present everywhere in the universe, and to penetrate one’s self is to clearly see (through) the entire world, in which he is included, and vice versa.

Another perspective from which to assess the theory regarding insentient beings focuses on the definition of the term “sentience.” Traced back to Early Buddhism, the Buddhist canons do not offer definitive accounts as to whether plants are sentient or insentient. The *Vāseṭṭha-sutta* and *Suttanipāta* do categorize herbs and trees as belonging to the animate realm (*pāṇa*), meaning they are not purely passive or static. Nonetheless, this account cannot be used as evidence to justify that plants are sentient, have sentiments, and can think. Plants, in Schmithausen’s (2009) words, are “borderline beings” between sentience and insentience in the Early Buddhist canon, and they have a sense of touch according to early Indian thought. Consequently, Ellison B. Findly (2008) goes so far as to propose that in Early Buddhism, the “one-facultied” living beings’ possession of one sense faculty implies the possession of the other five senses and that such kind of living beings have developed advanced spirituality like liberated saints. It is interesting to juxtapose such a presumption with the Mahayana *Mahāparinirvāṇa-sūtra*, which teaches that each of the Buddha’s sense faculties functions as all of the six. However, even if we temporarily accept Findly’s hypothesis, we cannot extrapolate that non-botanical matter is also sentient.

One might also appreciate the doctrine of insentient beings’ Buddha-nature in a contemporary context. In psychological terms, when one is less discriminating, one would be more content with what one already has. In the face of any situation in daily life, one would construct positive values and respond with tolerance (not

acquiescence). Such a perspective on life is made possible through acknowledging the identity between Buddha-nature and all dharmas, which in a broad sense includes mental objects and elements of experience. Some might worry that this belief would undercut efforts for self-improvement or lead to self-abandonment, since even anxiety, depression, and ill-treatment can be considered expressions of Buddha-nature. However, seeing unpleasant things as Buddha-nature would instead encourage one to build a positive, healthy attitude toward life for solutions in difficult times. Knowing that even repulsive or melancholy experiences are perfect Buddha-nature itself, one is challenged to realize the precise way in which this is so in order to think and act in ways that will allow this intrinsic Buddhahood to become manifest.

Under the principle of non-duality, the dichotomy between (sentient) activity and (insentient) passivity, and between the absence and presence of Buddha-nature in both sentient and insentient beings, disappears. This sense of equality would enhance “our” respect for “other” nonhuman beings and may lead to a psychological ideal: a practitioner in his or her encounter with the world is no longer self-centered and does not judge things with one-sided views. The (sentient) mind and (insentient) matter no longer contradict each other. Instead, the mind exists in the realities-as-they-are, and the reality-as-it-is encompasses all minds. Thus, it would be a failure to insist that a subjective consciousness comprehends the objective world. Once the dichotomy between the perceiver and the perceived is eliminated, sentient or insentient beings *outside* of me no longer exist, and there is no self who approaches or chases after the external world. Consequently, there are no more rivals “I” can compete with, there are no beloved ones “I” am passionately attached to, there are no sensuous desires “I” yearn for, there are no stimuli that can tempt or annoy “me,” and nothing is really “mine.” This progress in meditation is a corollary of eradicating the bifurcation between self and other, or one’s inner consciousness and external objects: each phenomenon, as I perceive it and as it really is, on the one hand, resonates with me and, on the other hand, does not

really exist outside me. I have Buddha-nature and so do all beings in the world. All sentient beings, the insentient world, all Buddhas, and I have the same nature.

Buddhism

Paul Larson

The Chicago School of Professional Psychology,
Chicago, IL, USA

Buddhism is one of the world's major religions. It arose in northern India in the sixth century before the current era from the teachings of Siddhartha Gautama (563–483 BCE.). It grew out of Hindu thought and shares a common worldview based on the concepts of dharma, karma, reincarnation, and the manifest world as illusion or “maya.” Dharma, translated often as “law,” “way,” or “path” refers to the immutable structure of the world and its constituent elements. But it differs from the Western concept of law, as it is not promulgated by a personal creator god but rather is simply the structure of reality. “Karma” is likewise an impersonal force through which the fruits of one's actions come back to enhance or diminish from one's growth on the spiritual path. This contrasts with the Western view of being subject

to judgment by a personal god. Reincarnation refers to the cycle of individual birth, life, death, and rebirth. This is termed the “wheel of life” or “samsara.” The goal of spiritual development is to end this cycle.

Siddhartha Gautama was according to legend a son of a king of the Śākya tribe (hence the epithet, “Shakyamuni,” or sage of the Śākyas) and was sheltered from viewing human suffering by his father. At age 29, he encountered an old person, a sick person, a corpse, and a mendicant, or wandering holy beggar common in the Hindu tradition. He found this new awareness deeply troubling and decided to leave his wife and child and his palace and life of comfort to pursue the religious life. He wandered with the sadhus and received much training in meditation and the practice of self-denial and discipline. However, he felt he had not received full attainment. After he broke a fast by taking a bowl of milk from a woman cow herder, his followers left him, thinking he had strayed from the path of complete asceticism. Then he sat down in meditation firmly intending to make the final breakthrough. He continued into the night and received many temptations for power, comfort, and so on, but persisted. He did achieve a final enlightened state where the whole of existence was made known to him including knowledge of all his previous lifetimes. As the dawn broke, he realized he had achieved his goal. His title, the Buddha, means “the enlightened one.” He claimed to have awakened fully and completely to the ultimate nature of reality with the capacity to retain this awareness while still embodied in the flesh. This day is celebrated in Buddhist tradition as Visaka. It is a combined birthday and day of enlightenment.

He initially doubted humans could either believe him or achieve this same result but became convinced he nonetheless needed to tell humanity about his achievement. So he sought out his former students who had gone to a deer park in Sarnath near what is now Varanasi (Benares) and preached his first sermon. This is known as the “first turning of the wheel of dharma.” In this sermon, he identified the Four Noble Truths which include the Noble Eightfold Path.

The first of the four noble truths is the reality and pervasiveness of human suffering. The second noble truth is the awareness that suffering comes mostly from our very human attitude of grasping, desiring, and reaching out for something. That can be a feeling, a mental state, a relationship with a person, or an object such as wealth, power, or fame. The third noble truth states that there is a way out of this endless cycle of suffering. The fourth noble truth is that the way out can be summarized in the Noble Eightfold Path, eight specific ways in which one can work toward achieving that same enlightenment that the Buddha experienced.

The Noble Eightfold Path is the most succinct statement of Buddhist spiritual methods and means by which spiritual growth is to be accomplished and how one is to live. It is often broken down in to three groups: two comprised of three truths and a third comprised of two. The first triad, “sila” (Skt. morality), is comprised of right speech, right action, and right livelihood. The second triad, “samadhi” (Skt. meditational absorption), consists of right effort, right mindfulness, and right concentration. The third, “prajna” (Skt. wisdom), involves right understanding and right thought. The former means seeing the world as it truly is and not as it appears; the second refers to the transformation of our thought processes which comes from the practice of the others, particularly those involved in samadhi.

Of all of the major world religions, Buddhism is often described as the most psychological. The truth in this comes from the fact that doctrines arise from the practice of meditation and are based in that experience. The meditative mind state is cultivated through practice. In a comparative sense, the “gnosis” that leads to salvation (nirvana) is completely experiential and direct. It is not mediated through concepts and talking or thinking about the divine; it is the experience of the divine. In both Hindu and Buddhist views, that experience is beyond personhood and the boundaries of conceptual logic. The path of spiritual development of all beings is the attainment of that state of non-duality which is known as nirvana. The very etymology of “Buddha” refers to

the view that enlightenment is a state of being fully awake and aware in a cosmically uncompassing mind. Despite the ineffable nature of the mystic union which Buddhists call enlightenment, it is the attainment of that state through the discipline of the mind that makes it such a powerful psychological tool. The goal of spiritual development is ultimately the dissolution of the self, which really is a fiction anyway. This contrasts with the Western goal of salvation of the individual soul.

After the death of the Buddha, there were several Buddhist councils which sought to redact his teachings (Skt. *sutras*) and codify rules for monastic life (Skt. *vinaya*). Soon explanatory and philosophical discourses (Skt. *abhidharma*) were added to make the third division of material within the Buddhist scriptural canon. The canon is known as the “*Tripitaka*,” (Skt) meaning three baskets in reference to these major divisions of the material (Goddard 1938/1966).

The Buddhist *sangha*, or community, comprised of both monastic and lay followers soon diversified into several schools of thought. The initial distinction occurred geographically: One branch went south, to Sri Lanka, Thailand, Burma Cambodia, Laos, and Vietnam. The other branch went first to the northwest, to Pakistan and Afghanistan, then over the high mountains of Central Asia into the Tarim basin of modern China. Here several Buddhist kingdoms flourished before the arrival of Islam. From there it went on to China, Korea, Japan, and meeting the southern transmission in Vietnam. The Sanskrit term “*Yana*” is generally translated as “vehicle,” and the southern stream called the *Hinayana*, or lesser vehicle, and the northern transmission called the *Mahayana*, or greater vehicle. The original *Hinayana* teachings became transformed into the modern *Theravada* school, which is the only remnant of that transmission (*Theravada* is the preferred name for this score, avoiding any pejorative connotations of *Hinayana*). Later, in the first millennium, Buddhism was influenced by a pan-Indian movement known as *Tantrism*. Out of this influence came esoteric Buddhism, or the *Vajrayana*, or diamond vehicle, as it is now known.

It is not a great surprise that the generation of Western students of Buddhism which began in the 1960s was drawn to the religion through the practice of meditation rather than the cultural aspects of daily religious practice that is at the heart of Buddhism in the ethnic Asian communities where Buddhism was the dominant religion (Fields 1986). Westerners went right for the psychological consciousness-based experiences and only later became aware of and began to find meaning in the cultural cycles of feasts, fasts, and the close interrelationship between a lay and a monastic community. The job of religious education of children and communal bonding was for many Westerners a secondary acquisition. Buddhist meditation practices are quite wide ranging. It shares with Hindu tradition the use of mantra meditation, based on developing the psychological of concentration; it has especially developed an open-focused meditation style now known as “mindfulness” in the psychological literature (Germer et al. 2005). Tibetan meditational practices are the most complex, involving visualizations, chanting, use of gestures (Skt. *mudras*), and ceremony.

The spectrum of Buddhism offers just as much variety of religious experience as in the Western monotheisms. As with many religions, there are traditions and sects where profound devotion to a particular saint, guru, or person is worked out through more emotional sorts of practices and devotional liturgies and others which are more austere and involve solitude and or denial. The artistic iconography of Buddhism likewise reflects the full range of human experience, from the bare and clean lines of a Japanese rock and sand garden to the ornate and vivid tankas of multiarmed divine beings in coital embrace all portrayed with a busy border of paisley brocade.

Buddhism and Ecology

Leslie E. Sponsel¹ and Poranee Natadecha-Sponsel²
¹Department of Anthropology, University of Hawaii, Honolulu, HI, USA
²Research Institute for Spiritual Ecology, Honolulu, HI, USA

Introduction

A statement by Bhikkhu Bodhi (1987, p. vii) reflects several of the core principles, values, and practices that are most relevant to Buddhist environmentalism: “With its philosophical insight into the interconnectedness and thoroughgoing interdependence of all conditioned things, with its thesis that happiness is to be found through the restraint of desire in a life of contentment rather than through the proliferation of desire, with its goal of enlightenment through renunciation and contemplation and its ethic of non-injury and boundless loving-kindness for all beings, Buddhism provides all the essential elements for a relationship to the natural world characterized by respect, care, and compassion.” Here these attributes will be explained and illustrated with

examples, several of them drawn from our field research in Thailand (Sponsel 2012).

Dependent Origination

The doctrine of dependent origination or codependent arising is called *pratitya-samutpada* or *paticca-samuppada*. It refers to the nexus of mutual causality, that is, the interconnectedness and thoroughgoing interdependence of all conditioned things. In other words, the origin of all phenomena is dependent on causes and conditions. Thus, no phenomenon is totally and absolutely independent. Nothing originates by its own power or exists alone. The principle of interconnectedness and interdependence is also fundamental to both systems and ecological thinking (Barash 2014). It is illustrated by an Earth Gatha from the well-known Vietnamese monk Thích Nhất Hạnh (1990, p. 195):

Water flows from the high mountains,
Water runs deep in the Earth,
Miraculously water comes to us, and sustains all life. (Also, see Nhat Hahn 2013)

This ecological relationship is also recognized by many local communities throughout the world where mountains are considered to be the source of water for sustaining human life and livelihoods. Often people consider such mountains to be sacred, such as many wet rice farmers in Thailand.

Suffering

Dukkha refers to suffering and is the central theme in the four noble truths discovered by the Buddha at the time of his enlightenment (see Table 1). *Samudaya*, the second of the four noble truths, recognizes that the ultimate cause of suffering is desire or craving as well as ignorance. A correlate

Buddhism and Ecology, Table 1 The four noble truths

1.	All existence is suffering
2.	Suffering is caused by ignorance and desire
3.	Suffering can end
4.	The way to end suffering is the Noble Eightfold Path

is that genuine happiness is to be found through restraining desire and being content through simple living. Related to this is *anatman* or *anatta*, the doctrine of “not-self.” It is the goal of enlightenment through renunciation or detachment. Monks and nuns are supposed to forego the usual materialism of the daily world and lead a life of voluntary simplicity and poverty satisfying only their essential needs of food, a simple robe, shelter, and medicine. Voluntary simplicity as demonstrated by one of the icons of environmentalism, Henry David Thoreau at Walden, is practiced and advocated today by many environmentalists such as Jim Merkel (2003). It is a fundamental way to substantially reduce one’s ecological footprint or environmental impact. As Buddhist Peter Timmerman (1992, p. 74) asks: “How can we survive on a planet of ten billion points of infinite greed?” Several recent publications have also critiqued the rampant materialism and consumerism of modern Western and other societies from a Buddhist perspective (Badiner 2002; Kaza 2005; Payne 2010). The Thai socially engaged Buddhist Sulak Sivaraksa (2009) has developed further E.F. Schumacher’s groundbreaking ideas on Buddhist economics by applying his own Buddhist thinking to promote sustainable economics in the face of globalization.

Concentration

The Noble Eightfold Path is the set of practical steps that the Buddha taught for his followers to pursue enlightenment (awakening) and ultimately *nirvana*, the release from suffering (*dukkha*) with the endless birth and death cycle (*samsara*) (Table 2). *Samadhi* is concentration, contemplation, or meditation. This is associated with the last three components of the Noble Eightfold Path, namely, right effort, right mindfulness, and right meditation.

The Buddha became enlightened through lengthy and intensive meditating under a Bodhi tree (*Ficus religiosa*). Critical junctures in his life from birth to death as well as enlightenment were associated with trees. Throughout his life the Buddha often dwelled, meditated, and taught in

Buddhism and Ecology, Table 2 The Noble Eightfold Path

6.	Right effort
7.	Right mindfulness
8.	Right meditation

natural places such as groves of trees, forests, mountains, and caves. Many of his followers have emulated this habit to this day (Sponsel 2012).

Nature provides an ideal peaceful venue conducive to meditation (e.g., White and Guyette 2010). Furthermore, nature is *Dharma* or *Dhamma*. The famous Thai monk Buddhadasa Bhikkhu (1998, p. 22) explains:

Everything arising out of Dhamma, everything born from Dhamma, is what we mean by ‘nature.’ This is what is absolute and has the highest power in itself. Nature has at least four aspects: nature itself; the law of nature; the duty that human beings must carry out toward nature; and the result that comes with performing this duty according to the law of nature.

Alienation from nature is recognized by ecopsychologists as a major source of illness, emotional as well as physical. Nature promotes healing. Human health and the health of nature are interconnected and interdependent. Various programs have been developed by Buddhists among others which include experience and meditation in nature as a source of healing for individuals and families (Coleman 2006).

Nonviolence

Ahimsa is the ethic of non-harming, noninjury, or nonviolence which is the first of the five precepts (*pancasila*). The ideal of avoiding causing harm to any and all beings as much as possible is common to Hinduism and Jainism as well as Buddhism, even if not always commonly and consciously practiced (Chapple 1996). Nonviolence means not only to avoid causing any harm

but also to practice compassion and loving-kindness toward all beings.

The Sangha is the Buddhist community of monks and nuns or, more generally, laypersons in addition. Among the more than 200 rules for monks in the monastic code are specific measures to practice non-harm to other beings including not only humans but also animals and even plants. It is a serious offense for a monk to intentionally cut, burn, or kill any living plant. Harming any animal is proscribed too. Monks are supposed to strain or at least check the water that they use for any purposes in order to avoid consciously harming any visible organisms in it. Also monks are prohibited from polluting water in any manner.

Vegetarianism, which is optional for most Buddhists, is a means of reducing the harm that one causes to other beings (Bodhipaksa 2009). It is also the most ecologically sound diet, reducing one's ecological footprint. The lower one eats on the food chain from plants to animals, the less energy is consumed, and the less waste is produced in the environment.

Compassion

Karuna literally means compassion while the related term *metta* means loving-kindness. In this case the primary aim of Buddhists is to strive to practice boundless loving-kindness for all beings. This is reflected in the Jatakas, a collection of 547 accounts of the previous incarnations of the Buddha. Most of these parables describe an animal that sacrifices its own life to save others. The Jatakas illustrate the core Buddhist virtues of wisdom, nonviolence, compassion, loving-kindness, and generosity. They demonstrate the interconnectedness and interdependence among beings as well (see Sahni 2008). The means of reducing suffering and pursuing enlightenment is to follow as much as possible the Noble Eightfold Path (Table 2). Each of its eight principles is relevant to nature to the degree that it is correlated with extending nonviolence, compassion, and loving-kindness to all beings (Koizumi 2010).

In the Mahayana tradition of Buddhism that predominates in East Asia, a person may become

a Bodhisattva by suspending their own pursuit of enlightenment with the purpose of helping to relieve the suffering of other beings and to promote the Buddha nature they possess, that is, their inherent potential to become a Buddha. This is reflected in the famous Metta Sutta:

May all be well and secure,
May all beings be happy!
Whatever living creatures there be,
Without exception, weak or strong,
Long, huge or middle-sized,
Or short, minute or bulky,
Whether visible or invisible,
And those living far or near,
The born and those seeking birth,
May all beings be happy!

In Thailand many temple complexes, but not all, are animal and plant sanctuaries serving in effect as islands of biodiversity. The sacred groves and sacred forests surrounding temples are visible from a mountain side or low-flying airplane. The most famous is the mountain temple called Wat Doi Suthep overlooking the city of Chiang Mai in northern Thailand. In and around a temple, visiting lay Buddhists as well as members of the Sangha are not supposed to disturb plants, animals, and other natural phenomena. For instance, Suan Mokkh, a monastery founded in 1932 by Buddhadasa Bhikkhu near Surat Thani in southern Thailand, embraces over 120 acres of forest. In effect, this forest monastery is an island refuge of biodiversity. Surrounding it is an extensive area deforested for rice paddies and rubber tree plantations. Without the presence of Buddhadasa and other monks, the forest area of Suan Mokkh would long ago have been converted to agroecosystems.

Skillful Means

At least one other core concept of Buddhism can be identified here. *Upaya* refers to skillful means in teaching and practicing the *Dharma*, the name for the Buddha's teachings. In northern Thailand and elsewhere, some environmental activist monks have symbolically ordained large trees to promote forest conservation. The saffron-colored cloth typically worn by monks is

ceremonially wrapped around a tree trunk to signal its sacredness. In effect the tree becomes a surrogate monk and thereby is usually protected (Darlington 2012). To kill a monk is the worst crime in Buddhism. Another initiative is the 99,999 Trees Project encouraging people to plant trees to gain merit. This initiative began at the temple called Wat Nawakaram near Khon Kaen in northeastern Thailand but has spread into many other parts of the country. At the temple of Wat Phai Lom in central Thailand, monks collaborated with government and conservation officials to protect the diminishing population of the Asian open-billed stork (*Anastomus oscitans*), which is now thriving in the area, although endangered in other countries within its range. Near the border with Cambodia at Wat Lan Kuad, also known as Wat Pa Maha Chedi Kaew, the monks even built an amazingly beautiful temple complex with over 1.5 million recycled beer bottles.

Elsewhere in Asia other creative skillful means that are applied in Buddhist environmentalism deserve mention. In 1993 the International Conference on Ecological Responsibility: A Dialogue with Buddhism, held in New Delhi India, agreed on the declaration "Towards Ecological Responsibility: An Appeal for Commitment." Recently a countrywide network of Buddhist clergy was established called the Association of Buddhists for the Environment in Cambodia. Some members of the Tibetan diaspora are monitoring and publicizing environmental concerns about Tibet through the organizations called Tesi Environmental Movement and Tibet Environmental News, which have very informative websites (also, see Buckley 2014; Lafitte 2013).

Beyond Asia, many socially engaged Buddhists are involved in environmental activism. Often Buddhist centers pursue conserving energy and other resources, recycling, and reducing waste and pollution, as well as organic farming, vegetarianism, and voluntary simplicity (e.g., Roberts 2009). Such activities can be observed at Bodhi Tree Forest Monastery, Tullera, Australia; Earth Sangha in Washington, DC; Eco-Dharma Centre, Catalunya, Spain; EcoSangha in Seattle; Green Gulch Farm in

Sausalito, California; Zen Mountain Center near Mountain Center, California; and Zen Mountain Monastery at Mt. Tremper, New York. Buddhists have also increasingly become concerned with global climate change (Stanley et al. 2009; Thompson 2012).

Conclusion

The high ideals of Buddhism are not always approximated in practice, a common deficiency of all religious and ethical systems. Also, some Buddhists are far more concerned with meditation in search of their own enlightenment than with the suffering of other beings eschewing the Bodhi-sattva ideal. Nevertheless, the enormous amount of diverse activity in various manifestations of Buddhist environmentalism worldwide is reflected in a search of Google.com conducted on July 7, 2012. It revealed no less than 260,000 sites for "Buddhism and ecology," 69,100 for "Buddhist environmentalism," 958,000 for "Buddhism and nature," 11,700 for "ecoBuddhism," 30,900 for "ecological Buddhism," 24,700 for "Green Buddhism," and 55,100,000 for "Buddhism." Many of these reflect Buddhist environmental initiatives on the ground, not just in cyberspace.

The arena of Buddhist environmentalism, or whatever it might be called, is destined to only grow in time. The Buddha repeatedly stated that ultimately he taught only about two matters, the cause and the end of suffering. Inevitably the suffering of humans and other beings will only increase in the future because of the pressures of human population growth, the failure to distinguish between basic needs and desires, and the assumption of industrial and capitalist societies that unlimited material growth and economic development are possible in spite of an inescapably limited resource base. As a consequence inequality, competition, conflict, violence, and war will only intensify in the near future producing even more suffering (Drda 2011; Edwards 2009; Spellmeyer 2010). Therefore, Buddhist environmentalism in particular and socially engaged Buddhism in general are most likely

becoming even more relevant than ever before given their central focus on suffering. Buddhists, like adherents from other religions, can make a significant contribution to creating more sustainable and green as well as peaceful and just societies in the future.

(For more on Buddhist Environmentalism, see Kaza and Kraft 2000; Pandey 2008, and Tucker and Williams 1997.)

Buddhism and Positive Psychology

Zack Walsh
Claremont School of Theology, Claremont,
CA, USA

Although positive psychology was not officially recognized as a discipline until 1997 (Seligman 2011), its chief concerns have always been the subject of great interest to modern Buddhists. Traditionally, Buddhism focused on eliminating the causes of suffering as pathways to human flourishing, but more recently, Buddhism has more directly emphasized the pursuit of happiness embodied by positive psychology. As David McMahon (2006) notes, this new emphasis is related to the modern spread of secularism, humanism, and materialism, which privileges immanent human concerns and raises people's expectations and hopes for happiness in this life. Modern ethics scholars have likewise viewed happiness and well-being as the central goal of Buddhist conduct by interpreting Buddhist ethics through Western ethical frameworks, such as utilitarianism (De Silva 1991), consequentialism

(Goodman 2009), and virtue ethics (Keown 2001).

In addition, modern Buddhist teachers expound the benefits of Buddhist practice to broaden its appeal. The Dalai Lama has been perhaps the most well-known advocate for the secularization of Buddhist ethics and encourages the engagement between Buddhism and science as a means to improve well-being. In 1998, his successful best seller, *The Art of Happiness*, proclaimed that happiness was the purpose of life for Buddhists and non-Buddhists alike, and in 1990, he helped establish the Mind and Life Institute, which has since catalyzed research in the field of contemplative studies, where the subjects of meditation and mindfulness are most frequently covered. As part of this burgeoning new field, several notable works in positive psychology have examined the intersection between secular meditation and well-being (Kashdan and Ciarrochi 2013; Niemac 2014).

Yet on the whole, few works successfully integrate material from Buddhism and positive psychology. Thus far, there are several books on happiness intended for popular consumption, which present a mixture of scientific evidence and Buddhist philosophy (Haidt 2006; Hanson 2009; Ricard 2003; Rinpoche and Swanson 2007). These integrative works embody a modern sensibility that highlights the compatibility between Buddhism and positive psychology. However, they typically interpret findings through a preferred religious or scientific lens, which limits dialogue to one dominant perspective. These popular works have also received criticism from Buddhist scholars who contend that they contribute to a confluence of two fundamentally different orientations toward happiness (Lopez 2012).

Since conflict generally arises when happiness is defined or measured according to competing religious or scientific perspectives, it is essential to first delineate how Buddhism and positive psychology use the term. In positive psychology, the term happiness designates the wide range of goals within the field, without it playing any specific role in its theories (Seligman 2002). In many cases, positive psychology's broad use of the

term allows multiple constructs of happiness to compete with one another, without favoring one in particular. On the contrary, Buddhism takes a much stronger normative stance and uses the term *sukha* to conceptualize a theory of happiness related to specific goals in Buddhist soteriology. “Buddhist and psychological perspectives on emotions and well-being” (Ekman, Davidson, Ricard, & Wallace, 2005) is the first article to explore the territory between psychological definitions of well-being and their differences with Buddhism’s concept of happiness. It describes the meaning of *sukha* as an enduring trait that emerges from a state of equilibrium and rests on an awareness of the true nature of reality.

Despite their prominence in Buddhism, the normative claims tied to *sukha* are often disregarded sources of conflict in Buddhism’s dialogue with positive psychology. Recently, a small number of comparative studies have emerged to discuss these sources of conflict in greater detail. From the outset, Owen Flanagan’s (2011) comparative study concedes that current scientific findings reject core religious beliefs (i.e., nirvana, karma, etc.), which implicitly inform Buddhist ideas about happiness. Yet, he argues that it’s possible for science and Buddhism to engage in dialogue if Buddhism is restricted to a secular, naturalized form of the religion, which is compatible with high epistemic standards. Another study by Michael Murphy (2011) examines the conflict created by disparate views of “self”, which problematically emerge in two opposite approaches to happiness. Whereas positive psychology posits the existence of a “self” and pursues happiness directly through the study of positive emotions, positive character traits, and enabling institutions (Seligman et al. 2005), Buddhism negates the existence of a “self” and pursues happiness indirectly by eliminating the causes of suffering which obstruct happiness.

In conclusion, Buddhism and positive psychology both promote human flourishing, though their paths toward understanding and realizing happiness differ substantially. Nevertheless, there remains an important opportunity for each to inform the other. Buddhism can learn from improvements in well-being arising from

technical developments in positive psychology, and positive psychology can be guided and evaluated by an examination of Buddhist models of human development. Future avenues for cross-pollination between Buddhism and positive psychology have been proposed by Styron (2013) and Walsh (2013).

Buddhism and Psychoanalysis

Ann Gleig

Department of Philosophy, University of Central Florida, Orlando, FL, USA

David Black (2006) notes psychoanalysis has recently been witnessing a resurgence of interest in religion and spirituality. Numerous interpenetrating factors have facilitated this occurrence (Jones 2007). These include the cultural shift from the modern to the postmodern and its corresponding undermining of science, rationality, and universal objective truth. The postmodern

emphasis on the constructed nature of truth has dethroned positivistic science and undone a strict opposition between science and religion. Theoretical developments within psychoanalysis, such as the relational turn and a concern with self-experience, have also rendered it more sympathetic to religion. In addition, many of the analysts pioneering the dialogue between psychoanalysis and religion declare both a theoretical and existential interest in spirituality and/or report having clients with adaptive religious commitments.

Buddhism has featured prominently in the contemporary psychoanalytic rapprochement with religion. Jeremy Safran (2003) explains the appeal of Buddhism among psychoanalysts as being due to the fact that Buddhism offers, at least in certain iterations, a “religion without beliefs,” a system of thought and practices that resonates both with certain modern values and the postmodern turn within analysis. He notes how the Buddha’s agnostic rejection of metaphysical speculation and his pragmatic emphasis on direct experience are attractive to the modern individualistic Protestant sensibilities that have also shaped psychoanalysis. Similarly, he draws attention to how Buddhism’s anti-essentialist worldview and model of subjectivity resonates with the constructivist epistemology and multiple subjectivities advanced by postmodernism. However, at the same time as celebrating its pragmatic/agnostic elements, Safran also acknowledges the presence of a metaphysical/faith current within Buddhism, and he calls on psychoanalysis to interrogate those aspects that obscure its more emancipatory aspects.

Awareness of the considerable differences within as well as between both Buddhism and psychoanalysis is crucial to understanding the encounter between the two enterprises. Indeed tracking the encounter between Buddhism and psychoanalysis is complicated by the fact that neither conversation partner is monolithic. A wide spectrum of psychoanalytic theory – including classic Freudian drive theory, ego psychology, Neo-Freudians, Self-psychology, object relations, intersubjectivity, and attachment theory – has been put into dialogue with different Buddhist philosophies and practices. In

discussing the relationship between the two, therefore, it is imperative to discriminate the specific forms on both sides that are being put into dialogue. Edited collections by Molino (1998) and Safran (2003) display this multiplicity of perspectives with varied contributions ranging from the relationship between Lacan and Zen (Moncayo 2003) to the issue of transference in Buddhist communities (Young-Eisendrath 2003).

William Parsons (2009) offers an invaluable service in dividing the history of the dialogue into three periods: 1880–1944, 1944–1970, and 1970–2007. He analyzes exemplary studies to tease out the main characteristics and developments of each particular historic period. In addition to identifying important differences and shifts in each interval, Parsons forwards three general themes that pervade the literature. First, he claims that all of the studies under analysis view both Buddhism and psychoanalysis as “healing enterprises composed of definitive understandings of personhood, explicit existential aims, and suggested mental techniques for realizing those aims.” Second, he notes that misunderstandings of the cultural differences between the two healing enterprises have shaped representations of both systems to various degrees. Third, he concludes that the dialogue shows clear signs of progress on both sides as advocates become not only theoretically but also existentially familiar with each other, a development that has resulted in psychoanalysis granting unprecedented legitimacy to Buddhist spiritual aims and experiences.

According to Parsons, the initial psychoanalytic encounter with Buddhism between 1880 and 1944 was severely hindered by a number of factors such as incomplete and poor translations of Buddhist texts, lack of cultural contextualization and differences, ignorance of the rich variety of Buddhist schools and practices, and lack of any first-hand contact with Buddhist teachers. In terms of its interpretative flavor, rooted in classical drive theory, studies from this period were reductive, espoused a psychological universalism, and reflected the prejudices of orientalism and Western ethnocentrism. Franz Alexander’s (1931) interpretation of Buddhist meditative states as

essentially inducing catatonia illustrates this classical reductive approach.

Parsons argues that three interrelated factors between 1944 and 1970 served to move the encounter into a more productive engagement. One was the development within psychoanalysis theory of Neo-Freudians, ego psychology, Self-psychology, and object relations perspectives that proved to be much more sympathetic to religion and spiritual than classic drive theory. Another was the dramatic social, cultural, political, and economic shifts that occurred in America during the 1960s, which resulted in a challenge to established norms of Christian religiosity and increased interest occurred in Eastern religions. During this period, Zen Buddhism emerged as a privileged conversation partner with psychoanalysis. A third factor was the gradual psychologization of Asian culture, particularly Japan. Arguably the most influential text from this period was Erich Fromm, D.T. Suzuki, and Richard De Martino’s edited collection *Psychoanalysis and Zen Buddhism* (1960), which presented an already westernized and psychologized Zen to an emerging counter-culture hungry for nondual philosophies and spiritual experience.

According to Parsons, the seeds laid down from this period have produced a more sophisticated dialogue between Buddhism and psychoanalysis during 1970–2007. He points to numerous factors that have facilitated an increased understanding of Asian religions such as Buddhism. These include continuing waves of Asian immigration, unprecedented access to a plurality of Asian religious communities, and an increased awareness of how cultural differences shape healing enterprises. Similarly, there has been the growth of departments of religion and comparative studies, significant improvements in translations, and increased scholarly specialization. Most important, Parsons claims, is the emerging social base, a therapeutically informed population that has considerable theoretical and existential knowledge of Buddhist religious philosophy and practices that is driving the dialogue. Studies from this period draw particularly from object relations (Epstein 1995, 1999) and

intersubjectivity (Black 2006) and display sophistication in avoiding both negative/reductive and idealistic/romantic approaches to the Buddhist-psychoanalytic encounter (Aronson 2004; Rubin 1996). Mark Unno's (2006) edited collection also introduces a needed cross-cultural sensitivity and dialogue with contributions cutting across geographical and disciplinary boundaries. As Parsons concludes, the emergence of a genuine dialogical approach during this period gives rise for optimism for future conversations between the two enterprises.

Buddhism's Mahāyāna: Bodhisattvas

John Thompson

Christopher Newport University, Newport News, VA, USA

In the early Common Era, a new movement began in the Buddhist world, the *Mahāyāna* (“Great Vehicle”). In contrast to Theravāda, Mahāyāna encompasses greater variety from sect to sect and is more “liberal” when it comes to the laity and their capacity for spiritual development. This is most evident in the Mahāyāna spiritual ideal, the *bodhisattva* (“wisdom being”), a personification of compassion and self-sacrifice. As an inspirational and aspirational focus for monastics and laity, the *bodhisattva* has been very influential in Buddhist societies. It also has immense psychological power and affords intriguing insights into the positive, spiritual depths of the human psyche.

Buddhist “Theism” and the Bodhisattva Path

The development of a devotional, “theistic” side of Buddhism dates far back in history, certainly to the earliest establishment of Buddhism as a “religion” open to more than renunciates. This process only increased as the faith spread beyond India. As Buddhism came into contact with non-Indian religions, it absorbed some of their views even

while remaining uniquely Buddhist. “Buddha” became more of an absolute essence of reality rather than merely a historical person, with the corresponding idea that there are many Buddhas presiding over different worlds than this one. Such teachings were formalized through a doctrine of the “Three Bodies” (*trikāya*) of the Buddha:

1. *The Transformation Body* (*nirmānakāya*): an earthly manifestation, e.g., Siddhārtha Gautama.
2. *The Enjoyment Body* (*sambhogakāya*): a heavenly Buddha presiding over a particular Buddha realm. The Enjoyment Body can communicate with other celestial Buddhas and is “enjoyed” by the faithful in worship and adoration.
3. *The Dharma Body* (*dharmakāya*): the One Absolute, Cosmic Reality.

This doctrine of the Three Bodies explained both the oneness of all Buddhas and the unity of the Buddha nature, the potential for enlightenment that all beings share. According to this teaching, the One True Buddha (Dharma Body) manifests as compassionate heavenly deities (Enjoyment Body) and as human beings who become enlightened on earth (Transformation Body), such as the historical Buddha. This encouraged a growing theistic character.

However, the most distinctive feature of Mahāyāna is the role played by *bodhisattvas* (“wisdom beings”). A *bodhisattva* is a devout Buddhist who vows to aid others, postponing his/her own awakening until all beings attain enlightenment. The *bodhisattva* ideal is present in early Buddhism (particularly in stories of Siddhārtha’s previous lives) but Mahāyāna greatly expanded upon it. *Bodhisattvas* share their merit with all beings. Those who are highly advanced along the path are reborn in the heavens from whence they can aid of any who call upon them, much like saints in Christianity. Such high-level *bodhisattvas* are almost indistinguishable from Buddhas in that both types of beings stand poised to bestow grace upon those who have faith.

For followers of Mahāyāna, the *bodhisattva* is the spiritual ideal versus the *arhat* (Pali, *arahant*),

the ideal in older forms of Buddhism. According to Mahāyānists, *arhats* are selfishly focused on their own liberation rather than relieving the suffering of others. To emphasize this ideal, Mahāyāna encourages all Buddhists, male or female, monastic or lay, to take *bodhisattva* vows, usually in a special ritual in which the aspirant formally vows to become Buddha and to liberate all who suffer. In practice, this amounts to living a devout and holy life in the understanding that one will eventually be reborn in a heavenly realm, from which one can transfer merit to others. There also is a sense that one may be reborn on earth if that would further other beings on their spiritual journey.

The *bodhisattva* path is a great journey involving the developing of six virtues: giving (*dāna*), morality (*śīla*), patience (*ksānti*), vigor (*vīrya*), meditation (*dhyaṇa*), and wisdom (*prajñā*). According to the earliest Mahāyāna texts, the *Perfection of Wisdom* (*Prajñāpāramitā*) *Sūtras*, wisdom is the most important – so important that *Prajñāpāramitā* has even been personified as a *bodhisattva* herself and extolled as “The Mother of Buddhas” (Fig. 1).

With perfect wisdom, the *bodhisattva* realizes the truth of emptiness (*śūnyatā*) and no longer distinguishes between “self” and “other.” The *bodhisattva* can then perform all other virtues “perfectly” with no selfish motive. Over time, the list of six perfections expanded through the addition of four more virtues: skillful means (*upāyakauśala*), vows (*pranidhāna*), power (*bala*), and knowledge (*jñāna*). *Bodhisattvas* at the highest level were understood as having mastered each of these perfections. Eventually, Mahāyāna thinkers devised a systematic outline of the *bodhisattva* path, dividing it into ten stages of attainment, with each stage corresponding to one of the perfections (Table 1).

Progressing through all ten stages is a venture worthy of great admiration and traditionally is said to require eons to complete. Generally it is understood that an aspiring *bodhisattva* will need the aid of various heavenly Buddhas and *bodhisattvas* to reach this goal.

Because of the popularity of the *bodhisattva* ideal and the necessity of aid for those following

Buddhism’s Mahāyāna: Bodhisattvas, Fig. 1 Statue of *Prajñāpāramitā* as the bodhisattva “Perfect Wisdom” (Public Domain. http://commons.wikimedia.org/wiki/File:Prajnaparamita_Java.jpg)

Buddhism’s Mahāyāna: Bodhisattvas, Fig. 2 Japanese statue of Mañjuśrī, wielding his “sword of perfect wisdom” (Public Domain. http://commons.wikimedia.org/wiki/File:Manjushri_japan.jpg)

Buddhism’s Mahāyāna: Bodhisattvas, Table 1 Systematic outline of the *bodhisattva* path

Ten perfections	Ten stages of attainment
Giving	Joy
Morality	Purity
Patience	Brightness
Vigor	Radiance
Meditation	Difficult to conquer
Wisdom	Facing <i>Nirvāna</i>
Skillful means	Fargoing
Vows	Immovable
Power	Spiritual intelligence
Knowledge	Dharma cloud

the *bodhisattva* path, Mahāyāna includes innumerable devotional cults dedicated to these heavenly beings, with some standing out as especially important. One of the earliest *bodhisattvas* is Maitreya (the “Friendly One”), the next Buddha of our world. Many Buddhists hold that Maitreya resides in a heavenly realm awaiting the time when he will be reborn here to teach the Dharma anew. Some Buddhists pray to Maitreya to hasten

his arrival or to be reborn when he comes, since it is believed that it is easier to awaken when one has the example of a living Buddha. Another well-known *bodhisattva* is Mañjuśrī, the guardian of perfect wisdom and patron of Buddhist monastics (Fig. 2).

By far the most popular *bodhisattva*, however, is Avalokiteśvara (the “Lord who looks down [from above]”). Avalokiteśvara is the embodiment of great compassion and has a long history of devotion throughout the Buddhist world, and his image is found all over Asia. Avalokiteśvara undergoes an intriguing shift in China, manifesting in female form as Guanyin, the “Goddess of Mercy.” In the form of Guanyin, this *bodhisattva* appears throughout East Asia and is particularly favored by women seeking children. While traditionally Chinese Buddhists since the later middle ages have viewed Guanyin as the feminine form of Avalokiteśvara, some scholars now argue that she also needs to be understood as having “absorbed” various more ancient *Chinese* goddesses – a phenomenon that only makes sense

given the East Asian tendency toward syncretic harmonizing and integrating various disparate elements. Again, this integrating dynamic suggests something of the *psychological* function of the various bodhisattvas (Guanyin, Yu). Another form of Avalokiteśvara is Tārā, who supposedly was born of his tears and is particularly revered in Tibet.

With the rise of the *bodhisattva* ideal, Mahāyāna spread among ordinary people far more effectively than the more monastically focused Hīnayāna (“Little Vehicle”) sects. *Bodhisattvas* have enormous appeal, becoming “saviors” for millions of people, and are often compared to Christ for their compassion and self-sacrifice. A major difference, though, is that while Christ is held by Christians to have been historically incarnated as Jesus, the historical character of many *bodhisattvas* is doubtful. In this respect, Buddhism remains very *Indian* since Indians have generally not emphasized the historical nature of their important religious figures.

Mahāyāna also ushered in new meditation practices. With the rise of cults to various *bodhisattvas* residing in numerous celestial realms, special visualization techniques became widespread, often drawing on earlier practices of “calling the Buddha to mind” (*buddhānusr̥ti*). Texts such as the *Pratyupanna-buddha-sammukhāvasthita-samādhī-sūtra* (“Sutra on Making the Buddha Appear Before One”) give instructions whereby, through concentrating on a particular *bodhisattva* or Buddha (often with the aid of paintings or statues depicting them in their wondrous realms), a meditator seeks a vision of that figure. Through intense training and devotion over several days, a practitioner can achieve an altered state of consciousness in which he/she sees the *bodhisattva* or even “join” the figure in his heavenly realm (Harrison 1998). Such visualizations became especially important with the rise of the Vajrayāna (“Thunderbolt Vehicle”).

The *bodhisattva* ideal is quite powerful, encouraging not just devotion but also the aspiration to become like these great figures. Śāntideva (c. 695–743), one of the foremost Buddhist poets

and author of the classic *Bodhicaryāvatara* (“The Way of the Bodhisattva”), concludes his work with these inspirational lines:

By all the virtue I have now amassed
By composition of this book, which speaks
Of entry to the bodhisattva way,
May every being tread the path to buddhahood.

May beings everywhere who suffer
Torment in their minds and bodies
Have, by virtue of my merit,
Joy and happiness in boundless measure.

As long as they linger in saṃsāra,
May their present joy know no decline,
And may they taste of unsurpassed beatitude
In constant and unbroken continuity. (Padmakara 1997, p. 162)

The Mahāyāna has often been dubbed “the *Bodhisattva* Vehicle” in light of the centrality of these figures, particularly at the popular level. Indeed, in light of this more devotional dimension, we are probably justified to understanding Mahāyāna as a religion of faith and grace, dimensions that often clash with notions of Buddhism held by many contemporary Westerners.

Bodhisattvas and Psychology

The psychological aspects of the *bodhisattva* path are quite intriguing. We can view bodhisattvas as personifying spiritual ideals that we wish to embody. Thus, for instance, when we act compassionately, we are not merely *like* Guanyin, we *are* Guanyin. Upholding such aspirational ideals helps overcome barriers between “self” and “other” that interfere with true compassion. Bodhisattvas, thus, are powerful catalysts for spiritual and psychological self-transformation. Zen author Taigen Leighton puts it well: “The bodhisattva path is not restrictive or exclusive, but offers a wide array of psychological tools for finding our personal path toward a meaningful, constructive lifestyle” (Leighton 2012, p. 25).

The power of the *bodhisattva* ideal extends beyond individual improvement, as it ultimately aims at the enlightenment of the entire world. The potential for positive social and cultural transformation here is enormous. Alan Senauke, a

contemporary Soto Zen priest and social activist, suggests that major figures of social change really *are* bodhisattvas: “They are real people. They walk and talk and practice Dharma with their bodies. Martin Luther King Jr. or Mother Theresa or the Cambodian monk Maha Ghosananda are Bodhisattva models for us because of what they did in the world, because they persevered in the face of violence, discouragement, and countless dark nights of the soul” (Senauke 2010, pp. 1–2).

There are, of course, various potential psychological problems in setting out on the *bodhisattva* path. Many of these stem from “hidden motives” that psychologically fragile people may mask by spiritual pursuits. Among the more common neurotic issues here are the unrelenting quest for “perfection,” withdrawal from painful familial and love relationships, avoidance of negative emotions such as anger or fear, deep-seated guilt that may manifest as in self-punitive actions, etc. (Suler 1993, pp. 139–146). While these can be quite serious, however, they are based on misunderstandings of Dharma and are by no means limited just to Buddhism (or other “Eastern” religions).

Certainly the idea that the *bodhisattva* must always be “nice” is unrealistic and not in keeping with everyday experience or Buddhist tradition. Often, a *bodhisattva* must be tough, even forceful; compassion may have to be expressed strongly and skillfully. Buddhist author and practitioner Lewis Richmond says that modern *bodhisattvas* should be understood as “compassion warriors,” and he gives several modern versions of *bodhisattva* precepts that might be more compatible with contemporary life: “stand up for what you believe in, do what you say you will, stand by your friends, fix a mistake if you can, don’t blow your own horn, protect the weak and vulnerable” (Richmond 2012). Contemporary Zen teacher Kobutsu Malone takes this even further, arguing that the true *bodhisattva* cannot conform to our preconceptions of somehow transcending the messiness of life but must continually question all aspects of existence including our social, political, and cultural environment: “Ultimately, the path of full awakening – the Bodhisattva ideal –

involves revolution” (Malone 2002). While this may not necessarily sound like a “religious” way of life, both Richmond and Malone demonstrate the way the *bodhisattva* ideal continues to be relevant over the centuries in any society.

The spate of neuroscientific studies of Buddhist practice in recent years sheds interesting light on the *bodhisattva* path. Various scientists and analytic philosophers have spent much time critically examining empirical studies of practicing Buddhists and claim that following the disciplined and altruistic path of Dharma really can result in true human happiness. While great claim has often been made here, Owen Flanagan, a participant in the “Mind and Life” series of encounters between the Dalai Lama and a number of prominent scientists over the past 20 years, has rightly pointed out that often such studies are methodologically suspect and make stronger claims than the evidence warrants. Still, Flanagan for one is cautiously optimistic that the Buddhist way of life, exemplified in the *bodhisattva*, offers a unique way to human flourishing, comparable in many ways to the Aristotelian concept of *eudaimonia*, and that may be compatible with scientific naturalism (Flanagan 2011).

The Mahāyāna notion of the *bodhisattva* marks one of humanity’s most enduring spiritual ideals. Deeply compelling, it has inspired religious seekers for centuries and continues to do so. In truth, the *bodhisattva* epitomizes the Buddha Dharma: being firmly rooted in the earthiness of the everyday world while seeking to lift all of humanity to a higher state.

Buddhism's Mahāyāna: Meditation

John Thompson

Christopher Newport University, Newport News, VA, USA

As in Theravāda Buddhism, so Mahāyāna includes meditation practices to transform rigid

mental and emotional habits and turbulent states of mind – something that, broadly speaking, falls within the parameters of Western psychology, particularly in its more clinical and therapeutic aspects. For the most part, these Mahāyāna practices resemble Theravāda ones, but as Mahāyāna spread to countries such as China and Japan, new forms arose. Of these, the practices found in Pure Land and Chan/Zen schools in particular have had enormous appeal and thus warrant extended attention for their psychological implications.

Pure Land

Pure Land, a religion where the faithful rely on heavenly figures for salvation, has roots in Mahāyāna teachings. Its central figure is the bodhisattva Dharmākara, a prince who became the Buddha Amitābha (“Infinite Life,” or Amitāyus, “Infinite Light”). According to the *sūtras*, Dharmākara made 48 great vows, one of which established a paradise (located in the “West”) where his followers are reborn.

Sūtras describe the Pure Land as a jeweled paradise where one's basic necessities (food, drink, etc.) are provided. There, all will dwell in the presence of a true Buddha, learning Dharma firsthand. Pure Land also picks up on notions that the Dharma will eventually decay. Centuries after the historical Buddha, many people were convinced that they lived in this age of decay, when they could no longer practice Buddhism properly. Some forms of Buddhism at that time were beyond the laity and few could master esoteric doctrines or intense rituals and meditations; thus many sought “other” help. Pure Land *sūtras* address such views, explaining how Amitābha helps all who call upon him. The main Pure Land practice is chanting a mantra: “Homage to Amitābha Buddha.” Although chanting is especially important as death approaches, followers often repeat the phrase regularly to focus their minds, and calling on Amitābha remains common throughout Asia.

Pure Land proved popular in China, since faith in a savior deity resembled Chinese folk beliefs, and Pure Land ideas and practices became

**Buddhism's Mahāyāna:
Meditation, Fig. 1**

B

widespread, along with elaborate paintings and statues of Amitābha and his attendants. Reciting the Pure Land *mantra* – known in Chinese as *nianfo* 念佛 (“remembering the Buddha”: Japanese, *nembutsu*) – was also common, often in conjunction with the fingering of beads (*malas*). Some Pure Land thinkers stressed concentrating on Amitabha and constantly repenting one’s sins, while others claimed that a single sincere saying of *nianfo* sufficed. Thus, one Pure Land master writes, “If just one instance [of recitation has such power], how much more must it hold true for those who practice constant recollection and recitation (*nian*)! Indeed, this is a person who is constantly repenting” (de Bary and Bloom 1999, p. 486).

Guanyin, the “Goddess of Mercy” and Amitābha’s main attendant, was particularly prominent in China. While Amitābha helps the faithful reach the Pure Land after death, many Chinese (particularly women) turned to Guanyin for aid in this life. Statues of Guanyin – graceful, whiteclad, and holding a child in her arms – resemble the Madonna with child. Several scholars have noted the seeming coincidence that, like Christianity, Pure Land has a God figure (Amitābha) and a mediator (Guanyin), is based on

faith and grace, and includes a devotion resembling the rosary (Ching 1993, p. 142) (Fig. 1).

Pure Land became a major school in Japan and, under the guidance of leaders such as Shinran (1173–1262), grew and split into a number of lineages. To this day most Japanese Buddhists are followers of Pure Land. Its strong resemblance to Christianity has intrigued Westerners for years, and much Buddhist-Christian dialogue has focused on Pure Land ideas and practices.

Pure Land devotion has subtle yet profound psychological effects. Chanting *nembutsu* is a deeply meditative practice, and in monastic settings, Pure Land retreats are as rigorous as those in Chan/Zen. Pure Land uses many artworks (paintings, statues) for visualizations. Faith in Pure Land involves giving up egocentric striving for salvation and is generally quite joyful (cf. Hindu *bhakti*). Followers join together in worship and pilgrimage – practices that help the faithful see themselves as part of something larger than their petty concerns. Rick Fields, a scholar of American Buddhism, realized this after years of intense (and self-conscious) meditation training: “If you really recognize that we are all already ‘saved’ by virtue of Amida’s vow, then you can finally (1) relax and (2) be grateful to everyone

around you” (Fields 1998, p. 205). One result is a profound compassion for others, often felt most keenly in times of loss – something that can lead to deep understanding of Dharma. One Pure Land priest observes, “Humanity is one single body, one living Buddha body. . . . My life and yours are completely autonomous. Yet we each exist only in total resonance with all other beings. . . . We rejoice and grieve as one living body” (Nakasone 1990, p. 87).

Chan/Zen

Chan derives from Indian practices of *dhyāna* (“meditation”). Such techniques came to China with early missionaries and had a ready audience among Daoists. Indian techniques, however, proved difficult, and as Buddhism adapted to Chinese culture, monks devised a simple form of meditation designed to still mind and body in order to attain an intuition of Truth beyond all thought. The Chinese called such meditation *channa*, the closest they could come to pronouncing the Sanskrit *dhyāna*. At first Chan was practiced in various monasteries and lineages, eventually coming into its own in the Song dynasty (960–1279 CE).

Chan’s motto (attributed to one of its patriarchs) tells us much about how Chan presents itself: “A separate transmission outside the scriptures, not relying on words and phrases, directly transmitted from mind to mind.” Legend says Chan began with the Buddha’s famous “Flower Sermon.” One day the Buddha took his seat before the assembled monks and, instead of speaking, silently held a single flower aloft. Of those present, only his disciple Mahākāśyapa got it, and he, in turn, passed the wordless teaching to *his* disciples. Eventually the transmission reached Bodhidharma (470–543 CE), who brought the teachings to China. From Bodhidharma, the transmission eventually passed to Huineng (638–713), the legendary Sixth Patriarch and “ancestor” of all later Chan masters.

Most scholars consider this account pious fiction. We know that in the fifth century a figure named Bodhidharma was in China teaching some form of meditation, but did not found a lasting

lineage. By the late eighth century, there were two main Chan branches, Northern and Southern, with the latter coming to dominate due to the efforts of Shenhui (684–758), a monk who received transmission from Huineng. Southern Chan eventually split into numerous sub-schools. During the ninth century master Yixuan (d. 867) established the Linji 臨濟 school, and by the eleventh century, another school, Caodong 曹洞, split off over matters of practice and realization.

Chan is based on a central paradox: we are all Buddha but we just don’t know it. It draws on Mādhyamika, Yogācāra, and Tathāgatagarbha teachings but stresses practice over study, pushing practitioners to an immediate intuition of Truth, a glimpse of one’s “true nature” (*kenshō* 見性). Because of its strict discipline, Chan traditionally has required a monastic setting.

Chan’s central practice is seated meditation 坐禪 (*zuochan*: Japanese, *zazen*), where practitioners still their minds by hours of sitting cross-legged, following their breath. Ordinarily, our minds are stirred up and muddy, like turbulent water. If we still our minds, we will clear just as water clears when held still. One Chan master writes, “If you do not practice meditation and enter *dhyāna*, then when it comes down to it, you will be completely at a loss. Therefore, to seek the pearl, we should still the waves; if we disturb the water, it will be hard to get. When the water of meditation is clear, the pearl of the mind will appear of itself” (de Bary and Bloom 1999, p. 524) (Fig. 2).

Chan monasteries also stressed labor (cleaning, gardening, cooking) to extend meditation into daily life. Such labor offsets the lethargy from hours of meditation, allows the monastery to be self-supporting, and helps focus the mind. Monastic life is strictly regimented, divided between work, study, ritual, and meditation. A typical day begins at 4:00 am and ends at 9:00 pm, with 2 h of meditation in the morning and 3–5 h in the evening. This schedule is punctuated monthly by intense meditation sessions (*sesshin* 接心) that entail 15 h of daily meditation and may last 7 days.

Since Chan is so demanding, it is common to deny an initial request to enter monastic life. Usually, an applicant must demonstrate sincerity by

Buddhism's Mahāyāna:

Meditation, Fig. 2 Soto students practicing zazen at Zengården Zendo in rural Sweden. (Courtesy of Spoktu. <http://commons.wikimedia.org/wiki/File:Zazen.jpg>)

waiting outside a monastery for 2 days and then spending several days in a small room, alone. When admitted, the applicant goes to the meditation hall and prostrates three times before the image of the Buddha before being assigned a small mat on which he will live, sleep, and meditate. After a few days he has an interview with the master and officially begins training.

Chan is famous for its *gongan* 公案 (“public cases”: Japanese, *kōan*), paradoxical stories or riddles designed to provoke a realization of Truth. Perhaps the most famous *gongan* is “If clapping two hands produces a sound, what is the sound of one hand clapping?” Such bizarre statements do not have rational answers, which is precisely the point. A master gives a *gongan* to his student and it becomes the focus of intense concentration. The student focuses on the *gongan* day and night in an effort to find a response until he exhausts himself, at which point a “solution” typically emerges. Sometimes *gongan* do not have verbal solutions – the “answer” may be a gesture, shout, or other demonstration of awakening. Accounts say *gongan* study leaves a student’s mind so receptive that a master can awaken him with a blow, phrase, or even a facial expression.

The master is central to Chan, transmitting teachings and verifying students’ progress. This

direct, face-to-face connection is essential for the lineage to continue. Yet ultimately, awakening – though sudden and miraculous – is nothing special, for one realizes what has always been the case. As Master Linji says, “Followers of the Way, the Law of the Buddha has no room for elaborate activity; it is only everyday life with nothing to do. Evacuate, pass your water, put on your clothes, eat your food; if you are tired, lie down. The fool will laugh, but the wise man will understand” (de Bary and Bloom 1999, p. 504).

Chan had tremendous impact on Chinese culture, inspiring calligraphy, poetry, and painting (all of which demonstrate “spiritual” as well as aesthetic insight). Most Chinese intellectuals are familiar with its teachings and express their admiration for it. Chan spread to Korea (where it is called Son) and Vietnam (where it is called Thien), but had its greatest influence in Japan, where it is called Zen. Linji Chan (Rinzai Zen) was introduced into Japan by Eisei (1141–1215), and Rinzai temples became great cultural and artistic centers. Caodong Chan (Sotō Zen) was introduced into Japan by Dōgen (1200–1253), one of Japan’s greatest philosophers. While never as popular as Rinzai, Sotō’s focus on *zazen* deeply shaped Japanese art. Later, a third school, Ōbaku 黄檗, arose in 1654. Ōbaku

combines Rinzai and Sotō, advocating sudden enlightenment for those few who are ready for rigorous *zazen* and *kōan* practice, while reserving a more gradual path for others involving *zazen* and the chanting of *nembutsu*.

Chan/Zen is very regimented and has been used for military training. It is powerful and can lead to profound transformations, especially in Linji/Rinzai, with its forceful breakthroughs. By contrast, Caodong/Sotō is more quietistic yet perhaps more radical with its focus on “just sitting” and admonition that meditation *just is* enlightenment. All forms of Chan/Zen aim at living life as it is, with no fuss. As one scholar says, “Chan is not a path traveled because of what we will find or be when it is over but because there is simply no better way of traveling” (Hershock 2005, p. 162).

Therapeutic Dimensions

Over the years, Chan/Zen has attracted interest from many psychologists. Both C. G. Jung and Erich Fromm were fascinated by discussions of Zen in the writings of D. T. Suzuki, the foremost “apostle of Zen” to the West. Jung wrote the foreword to Suzuki’s *Introduction to Zen Buddhism*, while Fromm and several colleagues collaborated with Suzuki in a series of workshops on Zen and psychoanalysis in the 1950s. More recently psychoanalysts have increasingly become aware of the paradoxical nature of intrapsychic dynamics – a fact that resonates deeply with Zen and Pure Land teachings. It is a mistake, of course, to equate Zen with Western psychotherapy, yet like “mindfulness” meditation, Zen practices have been integrated into clinical treatment. One example is the work of Clive Sherlock, a British psychiatrist trained in Rinzai, who developed “Adaptation Practice” in the 1970s based on Zen monastic routines. Marsha Linehan has drawn on Zen to develop “Dialectical Behavioral Therapy” (DBT), a program involving a continual reconciling of opposites within the psyche that has proven effective in treating borderline personality disorders. Since the 1960s, neuroscientists have studied the physiological effects of meditation,

often on Zen practitioners, using various devices (EEG, MRI, etc.) with intriguing results; such studies indicate that meditative states differ markedly from other mental states such as hypnosis, sleep, or catatonia. The “calm awareness” meditators achieve has measurable effects (lowered blood pressure, reduced respiration), and long-time practice “rewires” the brain in beneficial ways.

There are certainly potential problems in both Pure Land and Zen, psychologically speaking. Both can encourage escapism or unhealthy quietism in the face of genuine problems. Zen in particular can foster a spiritual competitiveness or a retreat into elusive, nonrational behavior. Interestingly, Zen masters have long discussed “Zen sickness,” a condition in which students may experience feelings of grandiosity or develop a narcissistic preoccupation with practice. The “cure”? Careful supervision by an experienced master. Whether a psychotherapist can do the same is an intriguing question.

Buddhism's Mahāyāna: Philosophy

John Thompson

Christopher Newport University, Newport News, VA, USA

Viewing Buddhism through the lens of “psychology” seems natural for many Westerners. While such psychologizing can be misleading, it remains the case that Buddhist thinkers do focus on a transformative liberation (“enlightenment”) through a regimen of study, contemplative exercises, as well as ascetic and moral training. This transformative intention is, broadly speaking, “psychological” in that it entails cognitive and emotional shifts that may radically alter a person’s demeanor and understanding of the world. Such an endeavor goes far beyond the parameters of mainstream Western psychology, but the primacy of “mind” in Buddhism invariably lends it a “psychological” flavor. Moreover, Buddhist thinkers have elaborated intriguing doctrines about the nature of the world and humanity that do qualify as “philosophies of mind.” This entry will

examine the major philosophical currents in *Mahāyāna* (“Great Vehicle”), the second major branch of Buddhism. Much mystery surrounds *Mahāyāna* origins, but it is clear that its spread into Central and East Asia (~first century CE) does correlate with the development of new scriptures, rituals, and meditation practices. Such changes do not mark a sharp break with older forms of Buddhism (such as Theravāda), but these new interpretations of the Dharma (teachings) did result in new philosophical “schools,” each of which has interesting psychological dimensions. Following scholarly convention, this presentation will use Sanskrit, Chinese, and Japanese terms rather than the Pali terms used in Theravāda.

Mādhyamika

The first Mahāyāna philosophical school is known as Mādhyamika (“Followers of the Middle Way”). Based on the teachings found in the *Perfection of Wisdom* (*Prajñāpāramitā*) texts, this school arose as a critique of earlier *Abhidharma* (“Higher Teachings,” philosophical analyses of the nature of reality) philosophies. From a Mādhyamika perspective, certain *Abhidharma* schools, with their obsessive focus on enumerating and cataloguing the ultimate factors (*dharma*s) that make up reality, had gotten bogged down in intellectual dogmatism thereby losing the Dharma’s liberating spirit.

Mādhyamika thinkers stress that *all* things, including our ideas and opinions, are “empty” (*śūnya*), lacking in any sort of independent, separate being. This means that nothing exists except insofar as it relies on other things. To emphasize the cognitive implications of these teachings, and the way that our rational-linguistic faculties deceive us into *not* perceiving this “emptiness” (*śūnyatā*), Mādhyamikas invoke the notion of two levels of truth: ordinary/conventional and ultimate. In this view, our daily lives involve opinions and assertions concerning the conventional level. Here, they are perfectly valid and useful. However, just as there are no actual “things” (i.e., separately existing entities), the words and

concepts we use to label them are, ultimately, false (deceptive). What's more, our very words and concepts insofar as they are "things" are also "empty." Thus no verbal formulation of the teachings is true at the ultimate level; it is beyond the reach of thought and language.

Because they maintain that ultimate truth is ineffable, Mādhyamika thinkers rely on a dialectics of *negation* to argue their points. Many proclaim no thesis of their own and instead attack their rivals' views through *reductio ad absurdum* arguments (arguments that refute an opponent by demonstrating the contradictions of his/her position). This method leads an "opponent" (one who dogmatically clings to a philosophical position) progressively through a series of proposed views, each of which is shown to be inadequate and/or self-contradictory. Eventually, one goes beyond *any* verbal teaching about reality. For Mādhyamikas, any defined philosophical position results in attachment and suffering; thus, we need to break free of all "views" of reality, even negatively phrased ones. Yet Mādhyamikas are not nihilists and claim to steer a "middle way" between affirmation and negation. The nature of language is such, however, that this "middle way" defies verbalization.

The most famous Mādhyamika is Nāgārjuna (ca. 150–250), whose treatise the *Middle Stanzas* (*Madhyamakakārika*), a brilliant refutation of "Hīnayāna" views, opens with a famous dedication: I prostrate to the Perfect Buddha, The best of teachers, who taught that Whatever is dependently arisen is Unceasing, unborn, Unannihilated, not permanent, Not coming, not going, Without distinction, without identity, And free from conceptual construction (Garfield 1995, p. 2).

Here Nāgārjuna makes full use of Mādhyamika negation while still demonstrating his abiding faith in the Buddha's teachings. Later in the same treatise, Nāgārjuna provocatively states that there is no real difference between *samsāra* and *nirvāṇa*. Nāgārjuna's disciple, Āryadeva (ca. 170–270), continued his master's polemical tradition, as did Candrakīrti (ca. 600–650), a major commentator on Nāgārjuna's works (Fig. 1).

Buddhism's Mahāyāna: Philosophy, Fig. 1 Statue of Buddhist philosopher Nāgārjuna. Samye Ling Monastery, India. (Courtesy of Immanuel Gibbs. Public Domain. http://commons.wikimedia.org/wiki/File:Nagarjuna_pond01.jpg)

Psychologically speaking, Mādhyamika holds to a philosophy of mind where intellect is central but bound up with emotions and attachments. Mādhyamika rhetoric suggests that *samsāra* (and the "suffering" it entails) is a construction of language (or rather, our rational-linguistic faculties) and that "suffering" will disappear once we see that it hinges on a mistaken notion of reality. There is a complex intention at work here, since Mādhyamika's negative dialectics make great use of paradoxes that push one beyond rationality. The implication is that the rational aspects of mind are but one layer (albeit the decisive one) and that in some sense they must be "short-circuited" so that other faculties can bring about the transformation to full awakening. Mādhyamika aims only to counter dogmatic attachments. In this sense, Mādhyamika is quite pragmatic, since the dissolving of the "ignorance"

created by our incessant rationality actually frees one to practice Dharma and attain enlightenment.

Yogācāra

The second major school of Mahāyāna arose in response to the perceived negative focus of Mādhyamika. Some thinkers sought a more positive view of Dharma. Moreover, these thinkers were deeply involved in meditation, hence the name of this school: *yogācāra* (“the practice of yoga”).

While Mādhyamika focuses on Emptiness, Yogācāra concentrates on the nature and functioning of mind; hence it is also known as *Vijñānavāda* (“School of the Mind”) or *Cittamātra* (“Mind Only”). Yogācāra thinkers claim that, whereas *Abhidharma* philosophers maintain that consciousness arises when the senses come into contact with their objects (a “commonsense” view), what actually happens is that a fundamental process of consciousness produces both sensations and their objects. Many scholars consider Yogācāra to be a form of idealism (a theory that the world is produced by the mind) but Yogācārins may be advancing a more subtle view: that the world *as we experience it* is produced by the mind rather than existing in and of itself. Yogācāra thinkers push us to realize that most of our lives are mental constructions of reality, “mind only.” This interpretation makes sense given the Yogācārin stress on meditation practices that often reveal the subtle workings of our mental processes.

In the Yogācāra philosophy of mind, consciousness manifests through six senses (sight, hearing, smelling, tasting, feeling, mental awareness) and their objects. Behind these six sense-consciousnesses is a seventh consciousness that unites the previous six and serves as the basis for reflection and self-awareness. Beneath these seven levels lies an eighth level, the “Storehouse Consciousness” (*ālaya-vijñāna*), and it is this level that generates the subjective and objective aspects of experience, just as ocean’s water takes form as waves. The Storehouse Consciousness

explains our apparent continuity in this life through periods of unconsciousness (sleep, fainting) as well as previous and future lifetimes and explains how karma functions. Each action and experience deposits a karmic “seed” which is stored in the Storehouse and influences how it generates later experience. Some time in the future (perhaps the next moment, perhaps years later), the “seed” matures.

Three Natures

Along with levels of consciousness, Yogācārins distinguish “Three Natures” (*trisvabhāva*) within experience:

1. The “imagined” nature (*parikalpita*): ordinary experience in which self and objects appear to be independent entities. Such independence, however, is only a superimposition of the mind.
2. The “interdependent” nature (*paratantra*): the real nature of experience, i.e., the fact that the “imagined” independent entities arise interdependently on the basis of the processes of consciousness.
3. The “perfected” nature (*pariniṣpanna*): experience when one has purified oneself from the ignorance that continually superimposes a view of reality in which we imagine ourselves and objects as independent. The “perfected” nature of experience is the realization of *nirvāna*.

These “Three Natures” are really stages of growth along the Buddhist path. We begin in a fantasy world of our own construction, but through diligent effort, we see the difference between our imaginings and how life actually is. Accepting life as it is rather than what we would like it to be enables us to eliminate our insatiable grasping at “things” and live in a more productive and happier way.

Early Yogācāra thinkers include the brothers Asanga and Vasubandhu (ca 400 CE). Vasubandhu was the more prolific, and his *Thirty*

Verses (Trimśikā) provides an overview of Yogācāra teachings, showing how they aim at awakening. He writes:

When consciousness with object is not obtained, then there being noobject, one is established in the state of mere concept, for there is no grasping for it. It is without thought and without object. It is also the supra-mundane knowledge. Through the destruction of the twofold depravities, there is reversion of the source [of such depravities]. This, indeed, is the realm free from influxes. It is unthinkable, wholesome and stable. It is the serene body of release. This is called the doctrine of the Great Sage. (Kalupahana 1987, pp. 213–214)

Yogācāra teachings spread among Buddhist intellectuals in the years following Asanga and Vasubandhu. Prominent later Yogācāra thinkers included the logician Dignāga (ca. 600) and Dharmapāla (ca. 600), who headed the great university of Nālandā, India. Yogācāra philosophy is probably the most complex Buddhist system and has aroused great interest among Western scholars. Certainly the Yogācāra view of mind as composed of multiple levels and its role in constructing our experience of life uncannily parallel contemporary psychological theories, especially with psychoanalytic schools and their findings on the way the unconscious shapes our conscious experiences. Moreover, Yogācāra's emphasis on the necessity of yogic practice alongside doctrinal study continues to exert tremendous influence on research into meditation and how it affects other aspects of practitioners' lives.

Tathāgatagarbha ("Womb/Embryo of Buddha") Thought

Another line of Buddhist thinking (although never a formal "school") speaks of a "Buddha within," the *Tathāgatagarbha* ("womb" or "embryo" of Buddha). The *Tathāgatagarbha* is like a "womb" in that it contains the potential to become Buddha; it is like an "embryo" in that it can develop into Buddha. Perhaps the best way to describe it is as one's "Buddha nature."

According to *Tathāgatagarbha* teachings, the "Buddha nature" is inherent in all beings; thus everyone has the capacity to become awakened.

Most people are unaware of their inherent "Buddha nature" because it is concealed by defilements (e.g., ignorance, hatred, greed), although generally texts do not clearly explain *how* such obstructions originally began. When these unwholesome thoughts and emotions are removed, the "Buddha nature" shines forth in its original purity, and one has attained *nirvāna*. We must beware of viewing the "Buddha nature" as a substantive "self." While some texts speak of the "Buddha nature" as eternal and unchanging, it is not a permanent "soul." A famous *sūtra* states, "Blessed One, the Tathāgatagarbha is Not a Self, nor a living being, nor a soul, nor a person. . . the Tathāgatagarbha is the womb of the Dharma realm, the womb of the Dharma body, the womb of the supramundane, the womb of intrinsic purity" (Strong 2008, p. 170). Thus, the "Buddha nature" is a latent potential for awakening that can be actualized through conscientious Buddhist practice. A number of texts elaborate on "Buddha nature" ideas. One treatise, the *Ratnagotravibhāṅga* ("Analysis of the Jewels and Lineages"), states: Like a Buddha in a faded lotus flower, like honey covered by bees, like a fruit in its husk, like gold within its impurities, like a treasure hidden in the dirt. . . like a valuable statue covered with dust, so is this ["Buddha nature"] within all beings (Mitchell 2002, p. 140).

"Buddha nature" literature has deeply influenced the Buddhist world, becoming the basis for the fundamental Chan/Zen paradox "We are always already Buddha." It is the source of bodhicitta, the "thought of enlightenment" that induces one to follow the *bodhisattva* path. The evocative imagery in "Buddha nature" texts resonates with mystical views in other religions that speak of humanity as bearing a "spark of the Divine" (Fig. 2).

Psychological and Therapeutic Dimensions

Mahāyāna philosophies evoke intriguing psychological insights and thus have strong therapeutic dimensions. Mādhyamika's negative method undermines dogmatism and the subtle pride that

Buddhism's Mahāyāna: Philosophy, Fig. 2 Page from the *Lankavatara Sūtra*, a major *Tathāgatagarbha* text (Public Domain. <http://commons.wikimedia.org/wiki/File:Lankavatara.jpg>)

often comes with philosophical learning, ideally engendering the humility and skepticism we see in early Buddhist teachings. Much of its rhetoric functions as a sort of cognitive therapy for a very practical end – to promote *enacting* the Dharma. As one scholar says, The *Mādhyamika* is radically deconstructive, pragmatic philosophy designed to be *used* for exposing, defusing, and dismantling the reifying tendencies inherent in language and conceptual thought...leaving behind nothing other than a dramatic awareness of the living present – an epiphany of one's entire form or life (Huntington 1989, p. 136).

Yogācāra presents a full-blown model of “mind” that provides a deeper psychological sense of Buddhist teachings. When coupled with a regimen of meditation, it can help practitioners gain a more “objective” view on how the mind works. Yet unlike models of mind in Western psychology, Yogācāra views of mind are aimed to a large extent to explain karma rather than the genesis of specific neuroses.

Tathāgatagarbha thought is less systematic but more exhortative, a characteristic that

underscores the soteriological aims of the Dharma. It may be that this positing of an inherent “Buddha nature” is really just an ad hoc explanation of experiences of “pure luminosity” in meditation and the like. By analogy, however, we can view this school as asserting an innately healthy core of the human psyche (a position in keeping with basic assumptions about humanity in much of Asia and contrary to more pessimistic “Western” understandings based on views of humankind as sinful). These “philosophies” present intriguing models of the mind and warrant further attention by scholars interested in cross-cultural psychological study.

Buddhism's Theravāda: Meditation

John Thompson

Christopher Newport University, Newport News, VA, USA

In all forms of Buddhism, philosophical study (especially *Abhidhamma*) and monastic discipline are deeply interwoven with the practice of meditation (*bhāvanā*, “cultivation”). The latter, of course, has attracted much attention in the West, with many people virtually equating “meditation” with Buddhism in its entirety. In actuality, the term “meditation” is very vague and can cover many practices of sustained concentration, but in the Buddhist context, it should not be viewed apart from other aspects of *Dhamma*. Moreover, the temptation for Westerners to view all forms of Buddhism in terms of psychology can be very misleading, as Buddhist teachings and practices generally are based on very different concerns than those shared by most contemporary Westerners, and the ethical and soteriological aspects of the *Dhamma* may not square very well with the secular nature of psychology as a discipline. Yet, it is undeniable that Buddhist teachings and techniques of meditation share a strong therapeutic dimension and so seem destined to attract a lot of interest from a Western psychotherapeutic perspective. The presentation here will provide a basic overview of Buddhist meditative teachings

as found especially in Theravāda, using Pali terms (Pali is the sacred language in Theravāda) and stressing their psychological dimensions. It will also look at ways that meditative techniques have influenced and been integrated into certain forms of Western psychotherapy.

Basic Meditation

Although the Buddha maintained that meditation was essential for his monastic followers, he was clear that such practices were not possible without physical and ethical discipline. Thus from the very beginning, it is clear that Buddhist meditation includes far more than what is normally considered part of Western psychological study or therapy. Physical discipline entails training to achieve and maintain proper posture (e.g., the “lotus position”) and to regulate one's breathing. Ethical discipline is harder, requiring the strict following of ethical precepts and removing impure thoughts. A practitioner should also learn to suppress the Five Mental Hindrances (sensual desire, ill will, lethargy, agitation over lapses in concentration, doubt). Overcoming these forces allows one to focus the mind and enter deep states of concentration.

Most Buddhist meditation aims at instilling “mindfulness,” (*satī*) a general attentiveness to a specific object. Mindfulness meditation is also known as “recollection” (in that one learns to “recollect” one's normally scattered thoughts). Developing mindfulness requires focus but is useful for cultivating patience and detachment from habitual reactions to the world and is important preparation for entering higher stages of meditation.

The basic style of Theravāda meditation is known as “calming and insight” (*samatha-vipassanā*). It begins by calming the mind's incessant jumping from thought to thought, usually by focusing on a simple bodily movement such as walking or breathing. Theravāda includes 16 different types of breathing practice, involving extending or shortening the breath or focusing on the breath's location in the body. Once a level of “calm” is established, a practitioner turns to

developing “insight,” by contemplating the breath itself, bodily postures, and sensations, the elements that compose the body and the like. In “insight” meditation, the practitioner maintains simple awareness of an object as it is, gradually developing the ability to sustain simple observation and thus see what reality actually is like. Through much practice of “calm and insight,” the practitioner learns to observe the way in which things arise and depart, moving on to perceptions, emotions, and other states of mind. Such practices enable someone to realize Buddhist teachings directly in his/her experience (Fig. 1).

Meditative training also aims at helping practitioners develop positive mental states. The most well known of these wholesome states are the four *Brahmaviharas* (“divine abodes”), virtues that allegedly can lead to rebirth in a heavenly realm (*Brahmaloka*). These are “loving kindness” (*mettā*), “compassion” (*karunā*), “empathetic joy” (*muditā*), and “equanimity” (*upekkha*). Typically, a meditator begins with developing these attitudes towards himself/herself and gradually extends them by stages towards all beings everywhere. Practicing these meditations is an antidote to selfishness and ill will and helps instill a generally cheerful disposition to life. Moreover, on the surface at least, such practices seem to dovetail very well with theories and techniques associated with the field of “Positive Psychology.”

The most authoritative Theravādin guide to meditation is the *Visuddhimagga* (“Path of Purification”), a manual compiled by the fifth-century scholar-monk Buddhaghosa. This work, one of the great commentaries on *Abhidhamma*, continues to have enormous influence, even as it may depart from the earliest Buddhist teachings. For example, Buddhaghosa extols the supernatural qualities of the Buddha and speaks of “secret teachings” that elders should reserve for only a select few of their disciples, seemingly in contradiction to the Buddha’s claim that he taught “with an open hand.” Buddhaghosa also stresses techniques of “meditation” (*jhāna*: Sanskrit, *dhyāna*) that receive only peripheral treatment in Buddhist scriptures. Among these is the use of circular devices of various colors (blue, yellow, red, etc.) that the practitioner constructs to serve as focal points for developing concentration. Gradually, a practitioner learns to deepen his concentration by constructing these aids solely with his mind, going on to achieve states of “trance” (*samādhi*) beyond sensory perception. In so doing, Buddhaghosa essentially redefines “meditation” in terms of these states of “trance” rather than other practices such as mindfulness of the breath.

It is probably best to view Theravāda meditative cultivation as one component within a larger project of training the whole person, a lengthy process that begins with the “outer” and proceeds

Buddhism's Theravāda: Meditation, Fig. 1 Thai monk in meditation in traditional “lotus” posture. (Photo courtesy of Tevaprapas Makklay. http://en.wikipedia.org/wiki/File:Phta_Ajan_Jerapunyo_Abbot_of_Watkungtaphao.jpg)

to the “inner.” This regimen begins with careful bodily discipline leading to greater psychological sensitivity and circumspection. During such training, a practitioner learns to detach from his ego and develops a more attentive and compassionate disposition towards others. Accomplished meditators also tend to be more open to and accepting of a variety of experiences (some of which might qualify as paranormal) without discounting them as “unreal.”

Facing Mortality

No challenge to humanity is as overwhelming as death, and one of the keys to Theravāda's longevity is its effectiveness in helping us come to grips with mortality. Joining the monastic order is a sort of “social death” that harkens back to earliest stage of Buddhism. In ancient India, taking up the life of a wanderer was tantamount to embracing death. The dangers of the world beyond the protection of home and hearth were very real in the form of predators (wild beasts and bandits), starvation, illness, and exposure to the elements. Early Buddhism required monks to clothe themselves in robes stitched together from the shrouds of corpses and even congregate at cremation grounds. To this day in Southeast Asia, forest monasteries are often located near cemeteries to insure the seclusion necessary for monastic training.

As we have seen, the Buddha deemed meditation as essential for his followers, and he outlined various practices. Among the most potent involved the “cultivation of the foul” (*asubhavanā*), the close contemplation of corpses in varying states of decay. These quickly proved to be very effective at counterbalancing the sensual desires that often plague renunciates. Some texts outline as many as ten categories of corpses, including bodies that are bloated, “gnawed” by scavengers, or smeared with blood. Yet there can be no denying that such practices can have unintended effects. One story relates that after teaching this form of meditation, the Buddha withdrew for a few weeks of solitude. Upon his return, he found that many monks who had

mastered the meditation became so disgusted with their *own* bodies that they committed suicide! At once, the Buddha summoned his remaining followers and taught them to meditate on the breath, a less drastic method for realizing the changing nature of existence. From then on, meditating on decaying corpses became optional (Wilson 1996, pp. 41–42).

Theravāda still maintains practices of “corpse meditation,” with the *Visuddhimagga*, the vast encyclopedic commentary on Buddhist teachings by the great scholar-monk Buddhaghosa, describing in lurid detail the various corpses suitable for contemplation: “There is a *worm-infested* corpse when at the end of 2 or 3 days a mass of maggots oozes out from the corpse's nine orifices, and the mass like a heap of paddy or boiled rice as big as the body, whether the body is that of a dog, a jackal, a human being, an ox, a buffalo, an elephant, a horse, a python, or what you will” (Nanamoli 1991, p. 185) (Fig. 2).

There is no denying the strongly negative impressions of such descriptions of “corpse meditations” and potentially problematic results of these practices. Some scholars have remarked on this seemingly unwholesome fascination with the macabre here, yet it would be a mistake to consider such austerities as central to Buddhist training. Rather, they are reserved for the most ascetically inclined members of the sangha. Some monks opt for a more contemporary version of this practice by observing autopsies. In addition to instilling aversion to the pleasures of the flesh, the rationale seems to be that such reminders of *dukkha* and the inevitable end of life will spur members of the community to greater attention to their spiritual practice. Jeffrey Schwartz has drawn inspiration from such Buddhist techniques in treating obsessive-compulsive disorder, focusing especially on confrontations with disgust and negative emotions in an overall calm state. It appears, at least in part, that these Buddhist techniques are roughly equivalent to more mainstream Western therapies of systematic desensitization and exposure coupled with habitual response prevention (Schwartz 1996). Perhaps more importantly, while such Buddhist attention to death may seem depressing, when viewed in a larger

Buddhism's Theravāda: Meditation,

B

sociocultural context, it becomes clear that Theravāda provides a set of powerful psychological tools that encourage us to accept and savor life while not neurotically clinging to it at all costs.

Theravāda and Psychotherapy

Buddhist analyses of mind and meditation practices have gained a great deal of attention in the West, and, as we have already indicated, Theravāda has proven especially fertile ground for psychotherapeutic exploration. *Abhidhamma*, for instance, is now often viewed as providing a detailed phenomenological psychology, and meditation has attracted a growing number of mental health professionals as a source of techniques of proven clinical value (such as “mindfulness”) and for its potential for therapeutic transformation and healing.

Among the more established figures drawing on Theravāda ideas in clinical work is Jon Kabat-Zinn, who has created a detailed regimen known as Mindfulness-based Stress Reduction (MBSR). Kabat-Zinn developed MBSR as a full 8-week program by working with patients at University of Massachusetts Medical Center. A related

program is Mindfulness-based Cognitive Therapy (MBCT), founded by Zindel Segal et al. MBCT draws on Theravāda practices (e.g., *mettā* meditation) for techniques that have been quite successful in alleviating depression and anxiety, anger management, etc. In addition, a number of prominent psychotherapists (Joseph Goldstein, Jack Kornfield, Sharon Salzberg) have had Theravāda monastic training and draw upon it in their work at centers such as the Insight Meditation Society of Barre, MA, and Spirit Rock Center in Woodacre, CA. Theravāda meditation techniques have proven especially helpful for mental health professionals (nurses, doctors, counselors) in handling work-related stress and in developing the detached attentiveness so necessary for them to work effectively.

Care should be taken, though, in applying aspects of Theravāda meditative practices into therapy. Several scholars and therapists have noted that meditation can pose certain threats to psychological health in some patients. Meditation can, for instance, uncover negative psychological content (e.g. suppressed memories of abuse or trauma) that have been relegated to the unconscious. When brought to light, such things may trigger anxiety, depression etc. Sometime taking

up meditative practice can also encourage a narcissistic preoccupation with one's 'self' as well. Overall, however, most research indicates that Buddhist meditation can have beneficial psychotherapeutic results that are well worth further exploration (Suler 1993, pp. 123–124).

It would be a mistake to view Theravāda as just a form of psychotherapy, of course. Theravāda is vastly more complicated than any sort of mental health program, and certainly we should avoid viewing *nibbāna* in purely psychological terms. Moreover, developing skill in various meditation techniques does not necessarily mean a person is psychologically mature. Yet the intersection between Theravāda and Western psychology undoubtedly will provide much opportunity for cross-cultural exchange well into the foreseeable future.

Buddhism's Theravāda: Monasticism

John Thompson

Christopher Newport University, Newport News, VA, USA

Monasticism, living an ascetic life dedicated to spiritual matters, is central to Buddhism and even today many people in Southeast Asia (where Theravāda Buddhism dominates) briefly join a monastic order to get an education. Still, the distinction between monastics (*bhikkhus* and *bhikkhunis*) and laypeople (*upāsakas* and *upāsikas*) is important. While by no means equivalent to education in Western academic psychology or undergoing psychotherapy, entering the

monastic path entails engaging in a powerful regimen of psychological training not normally available to laypeople. Following scholarly convention, this discussion of Theravāda will use Pali, an Indic language similar to Sanskrit, for all technical terms.

Basic Points Regarding Monasticism

There are many misconceptions surrounding Buddhist monasticism that need to be addressed from the beginning. First, Buddhism is not *just* for monastics, and monastics are not technically “higher” than laypeople. Second, Buddhist monastics are not missionaries seeking converts, nor are they “priests” since they do not serve as intermediaries for others. In fact, they really should not be called “monks” or “nuns,” as they are not bound by lifelong vows. Perhaps the best English equivalent would be “mendicant,” since they are supported materially by society at large (Saddhatissa 1987, pp. 69–70). For simplicity’s sake we can refer to them as “monks and nuns,” keeping in mind that this translation is somewhat misleading.

In Buddhism, becoming a monastic is called “leaving home” because aspirants leave their homes and join a community of fellow religious seekers. This does not mean, however, that monastics are cut off from the world. Following the model established by the historical Buddha, Theravāda monastics and laity exist in a symbiotic relationship in which the laity provides material support (food, clothing, property, etc.) while the monks provide spiritual and moral guidance. Monastics serve as a “field of merit” (*puñña*) by which the laity further themselves spiritually. This relationship constitutes a common social order that has held sway in Southeast Asia for centuries (Lester 1973, p. 130ff).

Joining a monastic order involves a series of steps. Although the Buddha stated that he was establishing a “middle way” between asceticism and indulgence, he stressed that monks and nuns were to live “depending on little.” Traditionally in Theravāda, a candidate had to be old enough to “scare away the crows” (about 7 years of age). At

the first level, the candidate’s head is shaved and he is given a monastic name and a set of robes with some other articles. Novitiate ordination only requires that the candidate repeat his vows of “refuge” and accept Ten Precepts (including abstention from wearing perfumes and flowers, singing and dancing, using a large bed, taking regular meals, acquiring personal wealth). Novices may advance to full ordination after intensive training lasting weeks or even months. During this ceremony, novices take their full monastic vows, kneeling for hours as the entire *Vinaya* (“Code of Discipline”), the section of the Buddhist Canon covering monastic life, is read to them. At the conclusion of ordination, new monks are informed of the traditional “four resources” available to them to secure their basic needs: a tree for shelter, robes made of rags for clothing, alms for food, and fermented cow’s urine for “medicine” (Fig. 1).

All monks and nuns must abide by the *Vinaya*, and from the very beginning, the Buddha prohibited criminals, escaped slaves, and debtors from joining the order, specifying that they were also bound by the laws of the state. He also set out rules and principles governing communal life. Theravādin monks are bound by 227 rules, but this number differs in other branches. Penalties for violating monastic rules vary depending upon the nature of the infringement. Serious violations (having sexual intercourse, stealing, killing, and claiming false levels of spiritual attainment) are known as “defeats” and call for expulsion from the community. Less serious violations require public confession and vows of repentance, as well as specific austerities, much the way some Christians take on penances after confessing their sins. Monastic communities have a distinct hierarchy, determined by seniority from the time of ordination. In addition, as per the Buddha’s instructions, every 2 weeks (on the new and full moons) the entire community assembles to chant the *Vinaya*, confess any violations, and reconfirm their monastic commitment. Daily monastic life can vary widely across different branches of Buddhism, and even from community to community, but all monasteries are dedicated to living according to and spreading the Dhamma.

Buddhism's Theravāda: Monasticism,

Fig. 1 Nine-year-old Theravāda novice monks in Myanmar/Burma. (Photo courtesy of Sputnikcep. Public Domain. http://commons.wikimedia.org/wiki/File:Novice_monks.jpg)

Monks also fulfill basic ministerial roles in Theravādin societies, often conducting funerals and festivals connected with the growing cycles of rice and other crops. Monks also conduct protective rituals (*parittas*) to mark special occasions such as the building of a new house, the start of a long journey, or in times of illness, drought, etc. In such ceremonies, the monks draw on their reservoir of spiritual power to ward off evil forces and invite blessings, much like priests or rabbis in Western societies.

Some people might dismiss the performance of such rites as secondary to monastic life, but this is far from the case. As theorists of ritual are finding, the performance of (and participation in) various rites can play a major role in maintaining individual and group well-being on many levels (Bell 1997, pp. 72–76). These *parittas*, rites of protection against evil spirits, while perhaps easy to dismiss as “superstition,” have for centuries been regarded as manifestations of Buddha’s truth and compassion; for the faithful, they are the very essence of Dhamma. The presence of the monks chanting Buddha’s words has amazing spiritual, psychological, and even physical power. As one scholar-monk puts it, the power of good thoughts mixed with the vibration of the sound can be transmitted over great distances. It is believed that the sonorous sounds of *paritta* soothe the

nervous system, purify the blood, and produce peace and tranquility of mind, thus bringing about harmony of the physical state (Saddhatissa 1987, p. 133).

“Nuns” in Theravāda

All branches of Buddhism differentiate between the order of monks and the order of nuns (*bhikkhunis*). From an institutional point of view, nuns are inferior to monks (even newly ordained novices) and are bound by many more rules. This comparatively inferior role for nuns reflects misogynistic attitudes prevalent in Asia from ancient times up to the present. Still, the Buddha, although reluctant, *did* admit women into the monastic order – a truly radical policy in his day. Moreover, nuns have long taken active roles in the operation of the *sangha* and ministering to the public. One of the most revered Buddhist texts, the *Therīgatha* (“Songs of Female Elders”), is a record of verses attributed to some of the earliest Buddhist nuns and evinces great faith and insight into the Dhamma. The *Therīgatha* has been, and remains, a major source of Buddhist wisdom for both men and women. However, due to war and invasions during the twelfth century, the lineage of nuns essentially died out in the Theravāda

world. This has led to a peculiar situation: tradition requires both monks and nuns to ordain women but since there is no formally recognized *bhikkhuni* order, there are no nuns to ordain women who have a monastic vocation. There have been attempts to remedy this situation in recent decades. In 1971 Voramai Shatsena (1908–2003) went from Thailand to Taiwan to be ordained as a nun and worked with other women (and men) to reestablish a Thai nun's lineage, but with limited success.

There are other options for women seeking to live religious lives, such as becoming *phram* (temporary “novices” who wear white but do not shave their heads and do not abide by strict monastic codes), or in some countries such as Thailand, they can become *māeji* (“sisters,” women dedicated to the religious life and who remain celibate). The latter go through ordination but are not bound by as many rules as full monastics. However, they are often ignored or even looked down upon by some more conservative Theravādins (Fig. 2).

The challenges for women leading religious lives in Theravāda society are steep, but those

who persevere gain a great deal. This is particularly true for those opting for the unorthodox role of *māeji*, who are slowly gaining influence in Southeast Asia. One scholar who spent over a year living with various *māeji* in Thailand observes that they are establishing an alternative spirituality for women that enables them to develop themselves and work for the betterment of society, particularly in ways that help women and children (Brown 2001, pp. 141–142). As such, they are compelling figures – dedicated and generous in the truest spirit of the Dhamma. They have much to teach spiritual seekers, especially women who feel oppressed or ignored by male colleagues. In this they recall the verses in the *Therīgatha* attributed to the nun Muttā: “Free, I am free/I am free/by means of the three/crooked things: mortar, pestle, and/my crooked husband./I am free/from birth and death/and all that dragged me back” (Murcott 1991, p. 104).

Stages of Spiritual Progress

While in theory, the monastic path is a gradual progress that eschews hierarchical rankings, Theravāda tradition divides it into four levels ranked according to progress towards *nibbāna*. The first level, the *sotāpatti* (“stream entrant”), is a *bhikkhu* who has overcome the “three fetters” (belief in a permanent “self,” belief that rituals will lead to salvation, doubts regarding the truth of Dhamma) and is assured of eventually attaining full awakening. The second, the *sakadāgāmin* (“once returner”), has further reduced sensual cravings and ill will. The third, the *anāgāmin* (“nonreturner”), has essentially eliminated all ties binding him to the world of desire. In Theravāda the ultimate spiritual goal is the *arhant* (“worthy one”). At its simplest, an *arhant* is a wise monk, perfect in knowledge and in conduct, who has removed all defilements and thus can recognize things as they truly are. Because of his attainments, an *arhant* may possess great supernormal powers. While traditionally discussions of these levels of attainment are couched in mythic language, we can interpret them psychologically. For instance, following the scheme of Abraham

Buddhism's Theravāda: Monasticism, Fig. 2 Group of *māeji* at a conference in Bangkok, November 2005. (Photo courtesy of Gakuro. Public Domain. <http://commons.wikimedia.org/wiki/File:Maeji.jpg>)

Maslow, we can view the *arhant* as one who is self-actualized: able to judge situations correctly, accepting of others, comfortable with solitude, and deeply identifying with their fellow human beings. Still, if we regard the *arhant* as the model of Buddhist psychological health, it is hard not to be struck by the contrast with contemporary Western views of “mental health” that include autonomy, self-assertion, and the enjoyment of sexual desire, among other things (Fig. 3).

In popular Buddhism, *arhants* may become the focus of their own cults, much like Christian saints, and claims of arhantship are often made on behalf of especially holy monks. Devout laypersons seek them out to ask for favors and may wear amulets bearing their images, and the monasteries of such monks may become sites of holy pilgrimage. Again, these practices may strike non-Buddhists as ignorant superstition (or even signs of psychological immaturity and dependence), but they make up the heart of much popular religion, and can provide comfort, a sense of community, and strengthen the hope and faith of ordinary Theravādins.

Monastic life is not for everyone, since it requires great devotion and discipline. Monastics

are models for all Buddhists. They are held to high ethical standards and are often not afforded the “luxury” of privacy or personal property. While Theravāda monastic life does not entail harsh asceticism, it does amount to a life of “selfless service.” A monk must be celibate, obey a body of ancient body of rules and regulations, serve his superiors as well as laity, and adhere to a set routine. Still, the monastic life is an opportunity for powerful psychological and spiritual transformation, even the attaining of *nibbāna*. In his account of his time living in a Thai monastery, Tim Ward notes the subtle power of monastic routine to shape life and attitudes. As one senior monk tells him: “You must remember, the rules are really just the practice of mindfulness and obedience. . . That’s what lies behind all our postures and bowing, the gestures of offering and holding hands together in a simple *wai* when speaking to a senior monk. They build a sense of care and beauty into a day” (Ward 1998, p. 267).

Certainly, Theravāda monasticism differs considerably from modern Western psychological training. For one thing, it does not aim at resolving internal or unconscious psychic conflicts and involves suppressing and transcending of desires.

Buddhism's Theravāda: Monasticism,

Fig. 3 Painting in Laos of the Ven. Ananda, one of the most popular early *arahants*, reciting the Buddha's teachings. (Photo courtesy of Sacca. Public Domain. http://em.wikipedia.org/wiki/File:Ananda_at_First_Council.jpg)

Furthermore, traditional discussions of the *arahant* ideal suggest that it entails *moral* as well as attitudinal and cognitive transformation. Moreover, paranormal and extrasensory powers are readily accepted in Theravāda tradition while most mainstream Western psychologists do *not* consider these phenomena valid or scientifically “real.” And yet, Theravāda monastic life provides an alternative, perhaps broader understanding of “psychology” that warrants serious consideration. Indeed, it is a centuries-old testament to the intertwining of body, spirit, and mind that challenges our understanding of what constitutes human well-being in the contemporary world.

Buddhism's Theravāda: Philosophy

John Thompson

Christopher Newport University, Newport News, VA, USA

It is almost a cliché for contemporary Westerners to approach Buddhism through the lens of psychology. This approach can be distorting, since Buddhism employs different models of the human mind/“self,” does not aim at producing “psychological health,” and is based on far different presuppositions about reality than we find in modern Western psychology. But it can provide a useful way to bridge what can seem like a daunting East/West chasm. Even so, it is helpful from the beginning to understand the immense variety within Buddhism, which, given a history of over 2,500 years that includes most every major Asian culture, is probably better viewed as a *family* of diverse but interrelated religions.

Theravāda, the “Teaching of the Elders,” dates back to the second great Buddhist council held some 100 years after the Buddha's passing in 483 BCE. Theravāda spread from India to Sri Lanka in the third century BCE, spreading throughout Southeast Asia, where it still

predominates in Burma (Myanmar), Thailand, Cambodia, and Laos. As its name suggests, Theravāda is the most conservative of Buddhist sects. Many Theravādins maintain that they are the keepers of the “original” Buddhism; however, scholars have concluded that such claims are unfounded. But because of its conservatism, Theravāda provides a good starting point for understanding Buddhism. This entry is a basic overview of Buddhist teachings as found especially in Theravāda, using Pali terms (Pali is the sacred language in Theravāda), and stresses their psychological dimensions.

Basic Dhamma

Initially the *Dhamma* (“teachings”; Sanskrit, *Dharma*) can seem confusing. While the teachings may seem abstract, they are rooted in specific situations and address common issues that plague people the world over. Thus they are not a systematic philosophy, so much as a body of guidelines meant to help us understand our world and live in a more peaceful fashion. One scholar notes, “Buddhist teaching is transformation manifesting as information” (Corless 1989, p. 217).

“Buddha” means “awakened one” – the Buddha “woke up” while the rest of us are basically asleep, ignorant of true reality. A Buddha is one who has attained *nibbāna* (lit. “blown out,” as in the “flame of ego” being extinguished; Sanskrit, *nirvāna*), a state beyond suffering. Although the Buddha declined to describe *nibbāna*, saying that it was incomprehensible for those enmired in delusion, it seems to be a way of living marked by clear understanding and acceptance of the human condition. Buddhists maintain that the historical Buddha was not the only one to attain such a state – others preceded him and exist in other world systems. Theoretically we *all* can follow his lead and become Buddha (Fig. 1).

Buddhist teachings are rooted in traditional Indian views of existence as a continuous cycle known as *samsāra* (lit. “wandering through”), a beginning-less round of birth-and-death that encompasses all beings. Most beings, ignorant of their true nature, are pushed along blindly by

kamma (“action”; Sanskrit, *karma*), continually subject to assorted joys and pains, death, and rebirth. However, Indian traditions also teach that one can escape *samsāra* through spiritual training, attaining liberation from suffering (Sanskrit, *moksa*). Within this basic Indian framework, Buddha laid particular stress on the notion of change. When we pay attention to experience, we see that everything is constantly changing from moment to moment. Buddha also stressed the interconnection between all factors within this ever-changing cycle. That is, all phenomena rely on each other for their being; nothing stands apart from the cycle of existence. Such interconnectedness means that all beings are bound together in an intricate web of relationships. Mostly, however, we are ignorant of this fact and instead labor under a sense of ourselves as separate individuals thrown in the midst of innumerable “others.” Invariably, such self-(mis)understanding means that we desire to preserve and protect ourselves. Such fundamental “selfishness” in turn manifests in actions motivated by hatred, delusion, and greed. According to Buddha, if we “wake up” our actions will be “free,” not born of neurotic compulsion. Attaining *nibbāna* comes from a life of good conduct and moral intention (for Buddhists *kamma* has more to do with volition rather than mechanical “doings”), as well as meditative training in which one learns to pay attention and discern what is actually the case.

The decisive feature of the Buddhist cosmos is the pervasive experience of suffering (*dukkha*; Sanskrit, *duhkha*). Life in *samsāra* means that no being is immune to loss, sadness, and death. Note that suffering refers not just to gross matters of pain and sorrow but also to the fact that even joy and happiness may be unsatisfactory because they are temporary and often disappointing. All beings inevitably suffer because nothing lasts and much that occurs is beyond our control. As the Buddha said in his first sermon: Now, monks, what is the Noble Truth of suffering? Just this: Birth is suffering, old age is suffering, sickness is suffering, death is suffering. Involvement with what is unpleasant is suffering. Separation from what is pleasant is suffering. Also, not getting what one wants and strives for is suffering

Buddhism's Theravāda: Philosophy,

Fig. 1 Painting of the Buddha preaching his First Sermon, setting in motion the “Wheel of Dhamma”. (Public Domain. Photo by Kay Ess, at Wat Chedi Liem, Burma. http://commons.wikimedia.org/File:Sermon_in_the_Deer_Park_depicted_at_Wat_Chedi_Liem-KayEss-1.jpeg)

(Strong 2002, p. 43). In other words, we could say that *samsāra* just *is* suffering, provided we remember that this suffering is our unenlightened *experience* of existence, not existence *per se*.

Buddhist teachings also detail some six “realms” of rebirth: humans, gods (*devas*), animals, hells, hungry ghosts, and *asuras* (“demonic beings”), often depicted as the *bhavacakka* (Skt. *bhavacakra*, “wheel of becoming”) lodged in the gaping maws of Mara, “Lord of *Samsāra*.” After death one is reborn in one of these realms, depending upon one’s past *kamma*, yet since all six realms lie within *samsāra*, they are marked by constant change and suffering, to varying degrees. According to tradition, the historical Buddha himself surveyed the universe with his divine vision and perceived all beings everywhere as they were passing in and out of the many realms of rebirth. In addition, Buddhists maintain that in this life, we can experience these realms in visions, dreams, meditative states, or through memories of previous lives. However, many Buddhists understand these realms less as literal places than as psychological states. Thus, “rebirth in a hell realm” can be understood as a state of extreme fury (perhaps

when someone cuts you off on the highway), while one can be “reborn in a *deva* realm” when experiencing great joy (say, when enjoying a hot fudge sundae). In fact, viewing *samsāra* as a cycle of consciousness (rather than “existence” in the grossest sense) is fully consistent with canonical texts and is especially common among advanced practitioners of meditation.

This brief overview of the *Dhamma* should suffice to highlight its psychological focus. A modern teacher sums up the *Dhamma* by quoting the famous *Dhammapada* (“Verses of the Teaching”): “‘Mind precedes all things; all things have mind foremost, are mind-made.’ Here we have the key to Buddhist Ethics, and, in fact, the whole of Buddhist teaching, for Buddhism is essentially a mind-culture” (Saddhatissa 1987, p. 22). Taking *Dhamma* seriously places one’s perspective in a much larger context, essentially reorienting our self-understanding. Invariably this makes one less selfish and subtly encourages an attentive yet somewhat detached attitude toward everyday experience. This basic Buddhist view has a “cooling” effect among traditional Theravādin Buddhists. Stephen Asma, an

American professor who taught in Cambodia, observed this quite often during his travels and writes of what one Thai friend of his told him, “The Thai people seek to have a cool heart at all times. We don’t always achieve this goal. . . . But having a relaxed approach toward the goal is just one more aspect of the Buddha’s lesson of moderation in all things. You Westerners have such hot hearts, it’s not good” (Asma 2005, p. 7).

It is difficult in light of such comments to resist the conclusion that, broadly speaking, Theravāda instills a more psychologically healthy orientation to ultimate reality among its more traditionalist followers in which people are more at ease than they are in more secular and commercialized societies such as the United States.

Abhidhamma

Particularly astute monks get extensive training in the subtler levels of Dhamma, an area known as the *Abhidhamma* (“further teachings”). Unlike most of the Buddha’s sermons, the *Abhidhamma* is highly abstruse, essentially being a systematic analysis of consciousness itself. As essentially a detailed catalogue of human psychology, the

Abhidhamma warrants the attention of anyone interested in Buddhist understandings of mind (Fig. 2).

According to legend, the *Abhidhamma* was first preached by Buddha in the heavenly realms and then passed on to Sariputta, his most intellectually gifted disciple. Eventually compiled into seven volumes, these texts supposedly reveal the natural laws governing awareness and involve sorting out mind (*citta*), mental factors (*cetasika*), matter (*rūpa*) in the terms of their basic properties, qualities, and the ways they interrelate to produce experience. The key to *Abhidhamma* is analyzing phenomena down to their ultimate level, the momentary “factors” (*dhammas*), and then classifying these “factors” into seemingly exhaustive lists. *Abhidhamma* texts are impressive in scope and are still studied by scholars. Such painstaking analysis of the diverse factors involved in perception, memory, emotion, etc. helps us realize how blind we often are to various dimensions of our world, but most *Abhidhamma* is beyond those not pursuing *nibbāna* full time.

Theravāda maintains a strong tradition of *Abhidhamma* study in order to train the mind to see through the mental constructions we

Buddhism's Theravāda: Philosophy, Fig. 2 Buddha preaching the Abhidhamma to his mother and the devas in Tavatimsa Heaven. (Courtesy of Hintha. Public Domain.

http://en.wikipedia.org/wiki/File:Buddha_preaching_Abhidhamma_in_Tavatimsa.jpg

typically project on to the world “out there.” Skill in *Abhidhamma* study leads to an acute discriminative awareness of reality. Traditionally Theravādin *Abhidhamma* recognizes 89 *dharmas* that comprise the bases of phenomenal experience (although the lists and categories are theoretically open-ended). Unlike other schools, though, Theravādin *Abhidhamma* eschews empty speculation, focusing instead on observing the foundations of human experience. In this it resembles phenomenological studies of Maurice Merleau-Ponty or Edmund Husserl, revealing how cognition and experience are actually the result of complex processes. Theravāda *Abhidhamma* even identifies a subconscious level of mind that is a repository for *kammic* forces and thus may resemble models of the mind in Western psychoanalysis. However, unlike the work of Freud, Jung et al., *Abhidhamma* does *not* focus on curing neurosis by bringing repressed feelings and unresolved emotional conflicts to consciousness.

Abhidhamma, although usually reserved for advanced monastics, has important applications to daily life. Familiarity with *Abhidhamma* can help us recognize factors that give rise to some of our thoughts and emotions, especially those that are wholesome versus unwholesome. This in turn can help us decide which states to cultivate and which to avoid. *Abhidhamma* also sheds light on important Buddhist teachings such as *anattā* (“no self”). Thus *Abhidhamma*, while difficult to master, reveals how our minds function, helps us understand conditions conducive to greater happiness and freedom, and can facilitate meditation practices.

Abhidhamma and Psychology

Theravādin *Abhidhamma*, while seemingly very esoteric, is an integral part of meditation (*bhāvanā*, “cultivation”), something many people equate with Buddhism. More importantly from a Westerner’s perspective, the analysis of “mind” and its various states that we see in *Abhidhamma* provides an intriguing alternative to Western

psychological maps of the human psyche. Ultimately, *Abhidhamma* is one of the most ancient systems of “psychology” in the broadest sense of the term – the systematic and abstract analysis by which humanity seeks to understand itself.

Perhaps it makes most sense to view *Abhidhamma* as a philosophical program of intellectual depersonalization aimed at developing emotional detachment and instilling a habitual orientation to life reinforcing Buddhist views of “no self.” Theravāda *Abhidhamma* breaks conscious experience down into a continual flow of momentary events and thus may be more akin to twentieth century *physics* than theoretical psychology (Anacker 2004, pp. 53–54). The resulting detachment, very much required for attaining *nibbāna*, can be taken to extremes and may be behind past accusations of *Abhidhamma* masters espousing a “monkish” form of Buddhism, not in keeping with the spirit of the historical Buddha. Some Buddhists have dubbed such movements “Hinayāna” (“Little Vehicle”) for their petty concerns in contrast to the theoretically more compassionate Mahāyāna (“Great Vehicle”). In general, such criticisms probably do *not* apply to Theravāda, which specifically includes practices designed to promote positive concern for others (e.g., the *Brahmaviharas*), as well as the ritual life intended to insure regular interaction with laity. Philosophically, Theravāda teachings are intended to be rooted in a direct, pragmatic approach to life.

All told, Theravāda philosophy is quite challenging, particularly with its detailed philosophical psychology. Of course, developing skill in *Abhidhamma* does not mean a person is necessarily psychologically mature or “spiritually wise,” any more than training in Western academic psychology means that all psychologists and psychiatrists are emotionally stable and well adjusted. Yet such study provides a deep sense of the many levels and dimensions of human mental and emotional life – something that may become increasingly important in a world that so often attempts to reduce people to the level of mere “consumers” or bloodless demographic statistics. At the very least, exploring the intersection between

Theravāda and Western psychology should provide much opportunity for philosophical exchange well into the foreseeable future.

Buddhism's Vajrayāna: Meditation

John Thompson

Christopher Newport University, Newport News, VA, USA

The most recent branch of Buddhism is Vajrayāna, sometimes called the “third turning of the Wheel of Dharma,” with Theravāda and Mahāyāna being the first and second turnings, respectively. Sometime around the third century CE, Vajrayāna teachings arose in India and spread, coming to dominate in the Himalayan region (Tibet, Nepal, Bhutan, etc.). Because it is mainly confined to the Indo-Tibetan region, this discussion uses Sanskrit and Tibetan terms and emphasizes meditations and symbolism found in the *Tantras*, secret ritual texts, all of which make Vajrayāna an incredibly powerful religion, from a psychological perspective.

Meditation

Vajrayāna meditation is typically integrated with rites and ceremonies and is based firmly on the Mahāyāna idea of all beings already having “Buddha-nature.” One meditation similar to *zazen* is “Great Perfection” (*Dzogchen*), a practice associated with the ancient Nyingma School, in which the practitioner directly realizes the pure nature of the mind. Guided by a *guru*, the student's mind gradually calms, and he becomes aware of the “empty” nature of mental and emotional states. From there he moves to a state of pure awareness, the innately luminous mind that is “Buddha-nature.” This undistracted awareness is the “essence” of *Dzogchen*, said to be like the roof of one's mind flying off, and as such experiences deepen, Buddhahood will spontaneously manifest.

Meditations involving visualization in Vajrayāna require more extensive training. Typically, a devotee concentrates on a Buddha, bodhisattva, or other deity, for whom he feels an affinity

with the aid of a *mandala* (“circle,” a symbolic depiction of the cosmos). At the first stage, the devotee may envision rays of light emanating from the deity in its heavenly realm, advancing to a stage of deep identification in which his consciousness is entirely absorbed into the deity’s being. Such intense visualizations may lead the devotee to sense the cosmic powers flowing through the *chakras* (“wheels” of energy located at certain points of his body) and perceive himself residing at the center of the realm defined by the *mandala*. The meditation concludes by dissolving the vision into nothingness, graphically encouraging release from ego attachment.

Vajrayāna deities are themselves complex figures, having dual aspects (peaceful or fierce) according to their functions; a deity is invoked in its peaceful form to bestow blessings but in its fierce form to repel evil forces. Practitioners also invoke and unite compassion and wisdom, key virtues to achieve enlightenment, often depicted in the “father-mother” (*yab-yum*) image of deities locked in sexual embrace. The extent to which such unions were ritually enacted, however, remains unclear (Fig. 1).

Regardless Vajrayāna meditations have great potential to benefit practitioners by helping them understand and gain control of their mental and emotional lives. Tarthang Tulku, one of the first Nyingma *lamas* to emigrate to the USA, writes that meditation can lead us to discover previously unrecognized resources within ourselves, helping us to realize “that the mind is our best friend” (Tarthung 1977, p. 128).

The Tibetan Book of the Dead

Vajrayāna shares attitudes towards death that we see in other forms of Buddhism. A Tibetan proverb states that one who does not remember the inevitability of death is like a queen – projecting an image of poise and composure while inwardly trembling with innumerable secret desires and fears. Ultimately much of the power of Vajrayāna derives from the way it helps devotees come to terms with the end of earthly existence.

Buddhism's Vajrayāna: Meditation, Fig. 1 Yab-yum image of deities Heruka and Vajravarahi. (Courtesy of Balaji. http://commons.wikimedia.org/wiki/File:Heruka_in_yab-yum_form.JPG)

One famous Vajrayāna legend is the saga of Milarepa, a story replete with suffering, magic, and violent death. The most famous scene involves Milarepa returning to his former home to confront death in the form of his mother’s corpse. This event becomes the catalyst for Milarepa’s spiritual quest, much like the historical Buddha. In his “autobiography” (a fictionalized retelling) Milarepa relates, “The ruins of the hearth mingling with dirt formed a heap where weeds grew and flourished. There were many bleached and crumbled bones. I realized that these were the bones of my mother. At the memory of her I choked with emotion and, overcome with grief, I nearly fainted. . . I seated myself upon my mother’s bones and meditated with a pure awareness without being distracted even for a moment in body, speech, or mind. I saw the possibility of liberating my father and mother from the suffering of the cycle of birth and death” (Lhalungpa 1977, p. 102). This scene underscores for many Buddhists the necessity of facing death and the loss it entails.

Tsongkhapa (1357–1419), the foremost Tibetan thinker, saw contemplation of death as central to the *bodhisattva* path and dedicates an entire section of his classic *Great Exposition of the Stages to the Path of Enlightenment* to it. For him, human life is a precious opportunity to understand the nature of *samsāra* and achieve a better future beyond this life. He writes, “Just so, if you create an authentic and full-fledged awareness that is mindful of death, seeing that all toiling for worldly qualities such as possessions, conveniences, and fame is pithless, like winnowing chaff, and is a source of deception, you will turn away from bad activities and, through accumulating good actions, such as going for refuge and [maintaining] ethics with constant and intense effort, you will extract the essence from that which is essenceless, like the body, and will ascend to an excellent state and will lead transmigrators to it as well. What, then, could be more meaningful?” (Lopez 1998, p. 428). Again, seemingly dismal practices actually promote a positive, compassionate orientation to life.

Vajrayāna draws on Bon, the archaic shamanic religion of Tibet, in handling death. Shamans, healers among indigenous peoples in the world over, commonly aid the deceased in passing into the spirit world. The influence of Bon is particularly evident in “The Liberation through Hearing in the *Bardo*” (*Bardo Thol Dro*, commonly translated as *The Tibetan Book of the Dead*), a work detailing the various stages of the *bardo*, the 49-day period between lives. Traditionally, clergy and loved ones read the *Bardo Thol Dro* to the dying (or a picture if the person is deceased) and to the deceased to help overcome attachments to his body or family, gain insight, and understand the visions appearing after death due to the deceased’s karma.

According to the *Bardo Thol Dro*, during the *bardo* the deceased faces an array of apparitions (ghosts, demons) but may also glimpse a marvelous light heralding Buddhahood itself. Advanced yogins often awaken during this stage, realizing that their visions are manifestations of their own minds to be accepted rather than rejected. More often, though, the deceased will recoil in fear and be drawn to a new rebirth. It is possible, however,

that through insight gained via training or by the aid of others, the deceased can progress towards enlightenment or attain rebirth in a Pure Land. Whether such mythical descriptions are ultimately “true” or not, the *Bardo Thol Dro* is filled with mysterious and powerful imagery surrounding death and the afterlife that also helps the bereaved channel their grief while preparing for their own deaths.

Therapeutic Dimensions

Since the mid-twentieth century, many Tibetans have fled the Chinese invasion for the West, and Tibet itself has become more accessible. Tibetan texts have been translated, thus allowing Vajrayāna to establish a foothold in the larger world as well. Because of its exotic and colorful nature, as well as the high profiles of some of its spokespeople, Vajrayāna will continue to attract attention with its possible therapeutic applications being particularly enticing.

Vajrayāna has proven quite effective in end-of-life care. A major contributor to this movement is Sogyal Rinpoche, whose book *The Tibetan Book of Living and Dying* reinterprets teachings and practices associated with the *Bardo Thol Dro* to help terminal patients and their loved ones become more mindful and accepting of their situation. Sogyal Rinpoche sees his work as promoting wise living and guarding humanity’s future safely. His intention, he says, is “To inspire a quiet revolution in the whole way we look at death and care for the dying, and so the whole way we look at life and care for the living” (Sogyal Rinpoche 1992, p. 358).

Because women play key roles in *Tantra*, Vajrayāna may be well suited to address aspects of women’s psychology. Certainly, the necessity of both male and female deities in Tantric rites suggests a more “woman-friendly” air than in many religions. This is a controversial matter, though, as the actual role of women in such rites is unclear and most Tantras are *male* centered. Yet female imagery in *Tantra* is undeniably empowering. Miranda Shaw in her study of women in Tantric Buddhism describes

visualizations of the *bodhisattva* Tara: “As the Buddha in the center of the *mandala*, her enlightened energy and ecstasy envelope the assembly in a cloud of bliss. Her retinue of twenty-four divine yoginis consists of eight wrathful goddesses in the eight directions, six red and six green goddesses in the next tier, and four door guardianesses (sic) in the directional colors who are ornamented by snakes and trampling the Maras. Like Red Tara, the goddesses of her retinue appear ferocious but are blissful, wise, and tender beneath their ferocity” (Shaw 1994, p. 106). Such imagery can help women become formidable *bodhisattvas*, unafraid to do what is right and to help those who need their aid.

C. G. Jung, one of the founders of psychoanalysis, was famously drawn to Vajrayāna symbolism, especially *mandalas*. For Jung, *mandalas* were potent examples of circle symbolism and a powerful means for accessing the archetypal structure of the Self. Jung said, “I saw that everything, all paths I had been following, all steps I had taken, were leading back to a single point – namely, to the mid-point. It became increasingly plain to me that the mandala is the centre. It is the exponent of all paths. It is the path to the centre, to individuation. . . . I knew that in finding the mandala as an expression of the self I had attained what was for me the ultimate” (Jung 1973, p. v).

Some scholars argue that Jung’s interpretation removes the *mandala* from its ritual context and renders it a universal abstraction rather than the intricate palace of a Tantric deity (Lopez 1998, pp. 145–147), but it is difficult to ignore the widespread power of *mandalas* in encouraging subconscious associations and insights (Fig. 2).

Jungian psychologist Rob Reece writes of the power of Vajrayāna to shape our understanding, saying, “When we enter the world of Tantra, we may need to loosen some of our preconceptions about the nature of reality. We begin to inhabit a twilight world where the distinctions between the material and the symbolic are less defined” (Reece 2006, p. 1). There is a decidedly playful aspect here, recalling the work of D.W. Winnicott concerning the vital need for creative “as if” approaches to the world. Taking on such a

Buddhism's Vajrayāna: Meditation, Fig. 2 Buddhist mandala. (Courtesy of www.buddhismus.at, http://commons.wikimedia.org/wiki/File:Mandala_gross.jpg)

perspective not only pushes us beyond our dualistic views but also aids work with darker forces within our psyches.

The Dalai Lama often draws on his Vajrayāna background to make connections between religion and science. For example, in September of 1991, he met with physicians, psychologists, and meditation teachers to discuss the body-mind connection and its implications for health and wellness. The published transcripts explore how Buddhist views of the mind may illuminate areas of experience that baffle Western psychologists. In a discussion on various levels of consciousness attested to in Buddhist texts, the Dalai Lama said, “My perspective on this is that there are many degrees of subtlety of consciousness, and science has looked only at the ordinary levels. So, science has merely not found the more subtle ones, which are crucial to the Buddhist presentations, and merely not finding is not enough to controvert. . .

Of course, the Buddhist explanation is also not completely satisfactory – a lot of questions remain” (Goleman 1997, pp. 227–228).

The Dalai Lama's suggestion that Buddhism and psychology may complement each other has increasingly appealed to many people, be they Buddhist or not.

Vajrayāna practices also have application in the field of medicine. Herbert Benson, a pioneer of mind/body medicine, observed Tibetan monks who, in meditation, were able to raise their body temperature by some 17° and slow their metabolism by as much as 64%. His team videotaped this practice in the winter of 1985, and his work has prompted medical exploration of ways that the “mind” can heal the “body.” Ironically, such “new” medical insights have long been central to Vajrayāna tradition.

Certainly Vajrayāna has strongly influenced “New Age” spirituality and self-help movements. Among the more famous (and controversial) figures here is Chögyam Trungpa (1939–1987), a lay Tibetan who founded Vajradhatu, a global network of meditation centers headquartered in Boulder, Colorado. Trungpa Rinpoche lectured and wrote many books presenting an alternative to mainstream American life – a life of simplicity and dignity best summed up in his classic *Shambhala: Sacred Path of the Warrior*:

The basic message of Shambhala teachings is that the best of human life can be realized under ordinary circumstances. . . that in this world, as it is, we can find a good and meaningful human life that will also serve others. . . At a time when the world faces the threat of nuclear destruction and the reality of mass starvation and poverty, ruling our lives means committing ourselves to live in this world as ordinary but fully human beings. The image of the warrior in the world is indeed, precisely, this (Trungpa 1984, p. 148).

This image, rooted in Vajrayāna tradition, resonates with principles and goals of humanistic and positive psychology. Trungpa Rinpoche's “spiritual warrior” may seem surprisingly down-to-earth for those convinced that Vajrayāna is all about mystical visions, violence, and sexuality.

Vajrayāna is peopled with a dizzying array of figures personifying all manner of cosmic and psychic forces. They carry us to the outskirts of sanity, revealing both the fragility and preciousness of our personalities and the various conventions governing society. At the very least, Vajrayāna offers a vast reservoir of images, symbols, and practices for transcending our self-imposed limitations that hinder the fullness of human life.

Buddhism's Vajrayāna: Rituals

John Thompson

Christopher Newport University, Newport News, VA, USA

Followers of Vajrayāna often call it the “third turning of the Wheel of Dharma,” the idea being that Vajrayāna is the culmination of the previous two “turnings” (Theravāda and Mahāyāna, respectively). Historically, there is some truth to this view, as Vajrayāna emerged much later than those earlier sects. Sometime around the third century CE, Vajrayāna teachings arose in India and spread throughout the Buddhist world, eventually disappearing in Theravāda lands and having only a brief heyday in China. However, Vajrayāna came to dominate the Himalayan region (Tibet, Nepal, Bhutan, etc.) and found a ready welcome in Japan, where it is called Shingon (lit. “true word”) and remains a major school of Buddhism.

Vajrayāna evinces no doctrinal break from Mahāyāna (it freely draws upon Mādhyamika, Yogācāra, and *Tathāgatagarbha* teachings) but reflects the infusion of practices from various Indian movements as well as the indigenous Himalayan religion of Bon. Because Vajrayāna flourishes especially in the Indo-Tibetan region, this discussion will often use Sanskrit and Tibetan terms and emphasize innovations found in *Tantras*, texts describing complex meditations and rituals, as well as the evocative symbolism and

transgressive behaviors that make Vajrayāna so distinct.

Ritual Focus

The term “Vajrayāna” can be translated as “diamond vehicle,” emphasizing the diamond qualities of hardness, clarity, and indestructibility, but is also translated as “thunderbolt vehicle,” in reference to thunderbolt scepter (*vajra*) of the Vedic god Indra. The *vajra* symbolizes cosmic power and is usually rendered as an hourglass-shaped wand which Vajrayāna adepts use in rituals. Its prongs represent different Buddhas and its power is enlightenment itself: unbreakable yet able to shatter all spiritual obstacles (Fig. 1).

Vajrayāna draws on both Hindu and Buddhist elements. With its ritual focus, it makes great use of *mantras*, magical chants and syllables evoking great power when properly uttered. Because of this reliance on *mantras*, Vajrayāna is also known as Mantrayāna (the “*mantra* vehicle”). Particularly powerful *mantras* are closely guarded, passed from master only to qualified pupils. *Mantras* do not necessarily have to be spoken orally to be effective, and they are often written on banners hung from trees and lines or on slips of paper that are rotated in cylindrical containers called “prayer wheels.” The most famous *mantra* is the Sanskrit *Om mani padme hum* (“Hail the Jewel in the Lotus”). Vajrayāna practitioners interpret this *mantra* in diverse ways, most commonly as an invocation of the female form of the bodhisattva Avalokiteśvara, “the lady of the jewel lotus.” Like other *mantras*, this one is the aural form of the deity herself but has other layers of symbolism, be it the correspondence of each syllable to one of the Six Realms of Rebirth or the Six Perfections of the *bodhisattva* path.

Vajrayāna is also known as “esoteric” (secret) Buddhism, or “Tantric Buddhism,” due to the centrality of tantric texts and rites. Tantrism is a complex movement having both Hindu and Buddhist forms that developed in India in the early Common Era as a critical response to

Buddhism's Vajrayāna: Rituals, Fig. 1 Vajrayāna ritual objects – *vajra* (Tibetan, *dorje*) and bell (*ghanta*). (Courtesy of the author)

institutionalized forms of religion. Tantrism uses special rites to tap into mysterious cosmic forces often portrayed in masculine and feminine forms. These techniques (known as *sādhana*) invoke the presence of various deities and aim at uniting a practitioner with such forces for spiritual transformation. These rites tend to be available only by initiation and training at the hands of a master.

Vajrayāna uses other ritual devices such as *mudrās*, symbolic hand and finger gestures associated with particular Buddhas or *bodhisattvas*; performing a *mudrā* allows one to embody symbolically a deity and can evoke certain states of mind. *Mandalas* (lit. “circles,” symbolic diagrams of the cosmos) also help devotees attain mystical union with a chosen *bodhisattva* or Buddha. Some of the most spectacular examples of Tibetan art are the great *thanghas* (wall hangings), portraying one or more Buddhist deities geometrically arranged in chartlike *mandalas*. Such *mandalas* are often the focus of complex visualizations preceding major rituals. The effect of ceremonially garbed adepts chanting *mantras* and performing *mudrās* against the backdrop of colorful *mandalas* gives Vajrayāna rites a truly “magical” air.

Traditionally an aspiring student must undergo an initiation (*abhiseka*) in which the *guru* (in Tibetan, *lama*) passes on details of the practices, transfers blessings of the relevant deities,

and bestows protection from the powerful forces to which the disciple will be exposed. Initiation begins with the master undergoing a series of visualizations. In these meditations, he visualizes himself as the focal deity (*vidam*), sees the ritual objects to be used (bells, *vajras*) as instruments of enlightenment, and views an image of the deity as being suffused with the divinity’s presence. The master offers the initiate water for purification and asks him to repeat *bodhisattva* vows for the welfare of all beings – an essential prerequisite to embark on the path. Patrul Rinpoche (1808–1887), a *lama* of the Nyingma school, stressed that a student must combine bodhicitta (“the mind of enlightenment”) and “vast skill in means,” writing: Tell yourself: “It is for their well-being that I am going to listen to the Dharma and put it into practice. I will lead all these beings, my parents, tormented by the miseries of the six realms of existence, to the state of omniscient Buddhahood, freeing them from all the karmic phenomena, habitual patterns and sufferings of every one of the six realms” (Rinpoche 1998, p. 8).

The disciple seals the vow by ringing a bell and displaying the *vajra*. The master then touches an image of the deity to the student’s head, visualizing the deity merging with the student’s body. Next, various symbols of the deity are touched

to the disciple's body at sites where centers of energy (chakras, lit. "wheels") are located. The master and disciple then take hold of a rosary and the master begins chanting the deity's "heart *mantra*" to elicit the deity's compassion, visualizing the *mantra* emanating from his heart into his disciple. Finally, another series of offerings and *mudrā* seal the transmission, binding student, *guru*, and deity together. Sometimes the initiate will vow to practice this rite every day until his death.

Rites involving fire form the centerpiece of most Vajrayāna ceremonies. Known as *homa* in Sanskrit (*goma* in Japanese), these rituals derive from ancient Vedic rites that formed the foundation of early Indian society. A typical fire ceremony requires constructing an altar in the shape of a *mandala* following ancient procedures. During the ceremony, a senior monk invokes certain deities, offering grains, clarified butter, and other foods into the fire while chanting *mantras*. Other monks assist by chanting *sūtras* and beating on drums to accompany him. The various offerings placed in the fire symbolize the individual's mental and spiritual afflictions (attachments, ignorance) that the flame (symbolizing wisdom) consumes. Adepts regularly perform such fire sacrifices for the benefit of all beings (Fig. 2).

Traditional death rites in Vajrayāna also hold great psychological power. Among the most striking is "sky burial," a practice that parallels to practices among followers of Zoroastrianism, the ancient religion of Persia, and certain Native American peoples. A "sky burial" requires a specially trained yogi (*tomden*) and cannot be performed before outsiders. The *tomden* performs special rituals involving prayers and *mantras* before dismembering the corpse and strewing the pieces on a stone platform encircled by prayer flags. This rite is a type of sacrifice in which the *tomden* offers the flesh of the deceased to benefit other beings, following the Buddha's example in his previous lives. The vultures flocking to the feast are regarded as of *dākinīs*, fierce female "Dharma protectors." "Sky burials" are thus graphic reminders of Buddhist views of impermanence and vivid demonstrations of the essence of the *bodhisattva* path. Sometimes adepts also perform such rites *mentally*, as ritual visualizations in which they offer their bodies for the welfare of all sentient beings as a way to strengthen their altruism.

Vajrayāna tradition is filled with hallucinatory accounts of adepts meeting with various deities, often through dark rituals and being instructed in esoteric rites to bring them closer to Buddhahood.

Buddhism's Vajrayāna: Rituals, Fig. 2 Shingon monk performing a *goma* ceremony. (Toji temple in Kyoto, 2008. Courtesy of Shii. http://en.wikipedia.org/wiki/File:Shingon_goma_ceremony.jpg)

The eleventh-century yogin Khyungpo Naljor recounts his meeting with the *dākinī* Niguma in the dead of night at a charnel ground and the intricate (and hair-raising) rites to which he is subjected: At that instant, the *dākinī* glanced suddenly about the sky, and her circle of innumerable *dākinīs* appeared from space itself . . . some of them built a *mandala* palace of three stories, some arrayed a *mandala* of colored sand . . . Then, late during the night of the full moon, she conferred on me the empowerment of the Body of Apparition and that of the Dream . . . she said, “Little monk from Tibet, arise!” and in a moment . . . we traveled three yojanas [about 24 miles]. There, in the sky above a mountain of gold, the *dākinīs* had assembled for the feast, dancing (Kapstein 1997, p. 183). The yogin goes on to relate that he journeyed to a “land of gods and demigods” where Niguma once again appeared and taught him mysterious yogic doctrines that are still taught in areas of Western Tibet.

The ultimate ideal in Vajrayāna is the *siddha* (“Accomplished One”), an adept in tantric teachings and practices who, at the popular level, resembles an *arhat* or *bodhisattva*. Between the eighth and twelfth centuries, there were 84 *Mahāsiddhas* (“Great Accomplished Ones”) in greater India who injected a dynamic spirit into the Buddhism of the time, passing these teachings down through the centuries. *Siddhas* take their names from the miraculous powers (*siddhi*) developed through meditation and rituals and typically are portrayed as wild shaman figures. *Siddhas* were crazy “wizard saints” who contact gods, cure illness, promote good harvests, or bewitch enemies and have been the focus of devotional cults. Perhaps the greatest *siddha* was Milarepa (1040–1123), a charismatic Tibetan hermit-poet who could withstand freezing temperatures in his mountain cave with complete equanimity. There were female *siddhas* as well – a feature of Tantrism that may hold clues as to its continuing attraction. Miranda Shaw notes, “The presence of women alongside the men is not an afterthought or an optional feature; it is integral to the Tantric paradigm, prized by the movement as its ideal pattern” (Shaw 1994, p. 195).

Vajrayāna Ritual and Psychology

Although it may not be apparent, the psychological power inherent in Vajrayāna rites is difficult to overestimate. It is important to understand that Vajrayāna is ultimately a performing art, and traditionally the lives of practitioners (particularly monks) are dedicated primarily to developing performative skill. This would include not just memorizing texts and mastering ritual techniques but fostering the altruistic motivation necessary for these rites to be effective (Robinson et al. 2005, p. 288). Training for and participating in these ceremonies has great potential for shaping practitioners’ psyches since, according to theorists of performance analysis, rituals reside at the intersection of the “mental” and the “physical.” Rituals are inherently bodily and sensual even as they are symbolic and spiritual. Moreover, the artistic aspects of these rites (e.g., painting and contemplation of *mandalas*) have long attracted the interest of psychologists and therapists.

Various important psychological theorists of ritual can help us understand the significance and power of Vajrayāna rites. For example, psychoanalytic thinkers such as Sigmund Freud have focused on ritual as a mechanism dynamic to appease repressed desires and resolve internal psychic conflicts, yet others such as Bruno Bettelheim and Volney Gay argue that ritual is a way of integrating asocial tendencies and adjusting to prescribed social roles. Indeed, Gay suggests that rituals, by aiding the ego to suppress (rather than *repress*) potentially dangerous impulses, may facilitate healthy psychological and social maturation (Gay 1979). Certainly these ideas shed important light on what is really going on in Vajrayāna ceremonies.

The diverse and complex symbolic aspects of these rites continue to puzzle most outsiders but Vajrayāna texts rarely define symbols (deities, *mudras*, *mandalas*) in a final, definitive fashion. What this means is that attempts to find “*the meaning*” may be misplaced. Rather, the focus is on the doing and performance itself. Moreover, rites often have very different goals, ranging from rites of passage (which ease transitions from one

phase of life to another), to rites of intensification (which reinforce group solidarity), to rites of protection (which ward off or control threats). Typically, nearly all Tantric rituals involve these goals to varying degrees. In the end, however, the key to all rituals (certainly those in Vajrayāna) is the active involvement of performer and audience.

Tom Driver, a scholar of ritual, speaks of ritual as “efficacious performance,” by which he means that ritual involves various agencies (gods, demons, nature, the state, the psyche) but invokes them to *do* something and, in doing so, displays incredible powers of creativity: There is a profound sense, and I think not an impious one, in which the unseen powers, including deity, have been brought into being by the rituals that invoke them. Durkheim observed: “. . . if it is true that man [sic] depends upon his gods, this dependence is reciprocal. The gods also have need of man; without offerings and sacrifices, they would die” (Driver 2006, p. 97).

Driver evinces an uncannily “Buddhist” view here (cf. Yogācāra views of mind) that “explains” much of what we see in the visualizations so integral to Vajrayāna rites. Driver also points out that ritual performance is playful – a performer assumes an “as if” attitude, imaginatively constructing the sacred space and time of the ritual in which actions may have multiple personal and religious effects for those who “play along.” We can clearly see Vajrayāna ritual as prime examples of such “playful work,” and they certainly can have profound psychological effects on observers and participants. It may be interesting to consider, as well, developmental psychoanalyst D.W. Winnicott’s views of play as *the* key to all creative and cultural activity (including religion), even proper and effective psychotherapy (Winnicott 2005, pp. 51ff).

Vajrayāna with its rich body of rituals explicitly includes intimacy, sexuality, gender, and embodiment – features often ignored or repressed in other religious traditions. Moreover, Vajrayāna embraces the world in its entirety, refusing to accept the distinction between “sacred” and “profane” as anything other than the product of our own delusional thinking. *This* notion, paradoxical

yet undeniably compelling, may be the true “secret” of Vajrayāna.

Buddhism's Vajrayāna: Tantra

John Thompson

Christopher Newport University, Newport News, VA, USA

Vajrayāna, the “thunderbolt vehicle,” is probably the most exotic of the three major branches of Buddhism. Much of the attraction to this style of Buddhism, both to “insiders” and “outsiders,” stems from the role of *Tantras*, texts describing complex meditations and rituals, as well as the evocative symbolism and transgressive behavior associated with them. To a large extent, these aspects reflect the infusion of non-Buddhist practices from various Indian religious movements; doctrinally speaking, Vajrayāna does not differ appreciably from Mahāyāna. Since Vajrayāna remains the dominant religion in the Himalayan region (Tibet, Nepal, Bhutan, etc.), this discussion will use Sanskrit and Tibetan technical terms.

Tantras

Often considered the secret teachings of the Buddha, the *Tantras* were likely composed more than a thousand years after the historical Buddha's passing. The term *tantra* itself is Sanskrit for “fabric/woven” and refers to practices that weave together body, speech, and mind in order to transcend *samsāra*. These practices combine meditations and rituals and aim at enabling the practitioner to attain Buddhahood as quickly as possible. A decidedly esoteric body of knowledge, the *Tantras* are written in an oblique style (“twilight language”) that requires extensive oral explanation by a master. As such, true understanding of the *Tantras* is open only to those who have undergone special initiations.

The *Tantras* themselves outline complex ritual procedures involving lengthy recitations, devotions to and visualizations of particularly deities, and yogic meditation. These practices draw on Indian theories in which a yogi learns to manipulate physical and mental energies in order to

transform the body, climaxing in a blissful state of union with pure mind. The *Tantras*, thus, are spiritual instruction manuals that, because of their power, have been closely guarded. Most scholars believe that the *Tantras* found in the Tibetan Canon also reflect influence from Bon, the indigenous religion of Tibet.

Tantras classify the myriads of *bodhisattvas* and Buddhas into family groups that are invoked in Vajrayāna practices. These pantheons can get quite large since each Buddha may include various emanations and will be accompanied by a *bodhisattva* and a female counterpart. In a typical ritual, the focus will be a *mandala* with the head of a particular Buddha family at the center and the other family members surrounding him, each place corresponding to the deities' cosmic connections. The ritual itself is often a group performance, with various adepts taking the roles of the members of the Buddha family arranged following the pattern of the *mandala*. Through meditations on these various deities, practitioners can experience visions that, in turn, help them gain deeper insights and powers on the way to achieving enlightenment (Fig. 1).

Antinomian Practices

Undoubtedly much of the interest in Tantra is due to its transgressive and antinomian nature. Because of the wondrous tales of *siddhas* (adepts), superficial readings of some texts, and the centrality of sexual symbolism in certain rituals, Vajrayāna has a reputation for encouraging wild behavior. There is some justification for this view. Passages in some *Tantras* speak of practitioners eating meat, drinking liquor, committing murder, having sexual intercourse, and even devouring human flesh – all violations of Buddhist precepts and universal taboos. Certainly rumors of “Left-handed” Tantric communities enacting such things have excited non-initiates. Some Vajrayāna practices are regarded as karmically dangerous, since devotees must engage in passionate acts (albeit in dispassionate states). Finally, traditional Vajrayāna art, with its depictions of wrathful deities (often in the midst

Buddhism's Vajrayāna: Tantra, Fig. 1 Tibetan *thangka* depicting Vajradhara and his retinue (Public Domain. <http://commons.wikimedia.org/wiki/File:Hevajra-Tibetan.jpg>)

of sexual intercourse), has aroused the interest of outsiders for years because of their seemingly pornographic nature.

During the ninth and tenth centuries, an anti-siddha movement arose in some circles, taking the inversion inherent in Vajrayāna to an extreme. Sometimes called the *Sahajayāna* ("Spontaneous Vehicle"), this movement advocated egotistical pleasure as the path to enlightenment beyond all dualities. One of these legendary adepts, who freely indulged in drunkenness, sexual license, and mixing with low caste peoples, proclaimed, "Here there's no beginning, no middle, no end, no *samsāra*, no *nirvāna*. In this state of supreme bliss, there's no self and no other" (Robinson et al. 2005, p. 135). Ultimately much of this movement was tamed and reabsorbed into Vajrayāna, but its influence, particularly in popular lore, has proven tenacious. Widely publicized

stories of the shocking behavior of several contemporary Tantric *gurus* (e.g., Chögyam Trungpa Rinpoche and his successor, Ösel Tendzin) have only strengthened this reputation.

Vajrayāna sexual rites are especially provocative. Tantra commonly teaches that sexual passion is a tool that when used properly can propel aspirants to Buddhahood. Some texts proclaim that attaining enlightenment *requires* sexual practice with a consort. One *Tantra* states:

The secret path without a consort
Will not grant perfection to beings.
Thus, attain enlightenment
By applying oneself most diligently
To the activities of erotic play
(quoted in Stevens 1990, p. 142).

In the same spirit, some texts even claim that the historical Buddha's awakening was ultimately the result of his sexual experiences with his wife. To what extent such statements have been taken literally has varied tremendously. The so-called "Right-hand" Tantra (the more "mainstream") interpreted discussion of masculine and feminine powers and their accompanying rites symbolically, while "Left-hand" Tantra allegedly acted such things out. Tantric rites included ritual unions where the partner was visualized as a deity; a non-celibate couple would envision themselves as divine being and consort. The goal was to confront lust, master it, and by harnessing its energy, transcend to enlightenment. Needless to say, "Left-hand" Tantric practices earned a bad reputation in various quarters, encouraging Tantric Buddhism to go "underground" and become a secret tradition.

Regardless of the truth behind such stories, the "logic" informing these rites has been well tested over centuries. By drawing on and understanding the passions rather than fighting them, a *tāntrika* (tantric practitioner) can overcome them, rather like fighting fire *with* fire, or, to use a more traditional metaphor, like using a poisonous plant to concoct a powerful medicine. As one *Tantra* states, "Those things that bind people of evil conduct, others use as a skillful means to gain freedom from the bonds of *samsāra*. The world is bound by passion, but by passion too it can be freed!" (*Hevajra Tantra*, II, 2.50–2.51. Quoted in

Mitchell 2007, p. 162.). The key is the careful and patient guidance of a master. Yet there can be no doubting the dangers of evoking and working with such potentially destructive forces. Evidence suggests that actual practices of sexual yoga have been rare (perhaps only among the most advanced yogins), with most Tantric practitioners remaining celibate. Of course this very danger is part of Tantra's attraction – it is invariably exciting to “take a walk on the wild side.”

Psychological and Therapeutic Dimensions

Tantra has long posed problems for Westerners, both scholars and the general public. Certainly much of this is due to its startling imagery and wild reputation, but problems also arise because Tantra is so often presented as an exotic/erotic curiosity divorced from cultural and ritual context. C. G. Jung is a Western scholar who is especially guilty here. Fascinated by the “Mystic East” in true orientalist fashion, Jung was also ambivalent (particularly about how meditation seemed, in his view, to bypass the emotions) about it even while drawing deeply on Vajrayāna in his analysis of “*mandala* symbolism.” Such criticism does not deny important insights from Jung's work, only to point out how it bears traces of a colonialist attitude, treating Tantra as another resource to be exploited for the enrichment of Europeans with little attempt at understanding it on its own terms.

There are even greater dangers with the popular “Tantra” peddled by entrepreneurs such as Osho-Rajneesh, the infamous “Guru of the Rich,” and like Margo Anand. According to these modern “masters,” Tantra is “spiritual sex” (“nooky *nirvana*”) that can be learned through a series of expensive workshops, videos, etc. As scholars have shown, this type of “Tantra” discards the traditional mythic and ritual trappings, focusing on sexual techniques sprinkled with large doses of “self-help,” all packaged and marketed to a consumer audience (Urban 2012).

Theorists of feminist psychology are often drawn to Tantra and, although this was not a

focus of Tantra in its original context, there is something very intriguing here. Female imagery abounds in Tantric art, and Vajrayāna is more attractive to women than other types of Buddhism. According to Rita Gross, a feminist scholar of Buddhism, views of women in Vajrayāna are “much more favorable than in any earlier form of Buddhism and among the most favorable attitudes found in any major religion in any period of its development” (Gross 1993, p. 1980). Miranda Shaw, a scholar who has extensively investigated the place of women in Buddhist Tantra, goes even further, arguing that Tantric Buddhist theory is based on the affirmation of women as embodiments of Tantric goddesses such as Vajrayoginī. Shaw notes that:

Vajrayoginī repeatedly states that she reveals herself in and through women. She claims that all forms of female embodiment – including supernatural beings, women of all castes and forms of livelihood, female relatives, and female animals – participate in her divinity and announces:

*Wherever in the world a female body is seen,
That should be recognized as my holy body* (Shaw 1994, pp. 40–41).

Critics, of course, argue that most Tantras are written from a *male* perspective and assume that the ideal practitioner is also male, yet Shaw points out that Tantric movements first began outside of the established male-dominated social institutions and were open to women and members of lower castes. Only later, as Tantra spread into universities and monasteries, was it “co-opted” by patriarchal powers. Moreover, over the years various female adepts (few of whom were the “wild” figures of Western imagination) have been the center of important local cults. A good example is Orgyan Chokyi (1675–1729), a nun from the Nepal/Tibetan area of Dolpo, whose “autobiography” provides a window on the travails of monastic life yet demonstrates deep compassion and insight. After her death, Orgyan Chokyi was designated a *dakini* (female Dharma protector), her remains enshrined in a *stupa*, and her life is commemorated in local festivals, dances, and oral retellings well into the late twentieth century (Schaeffer 2004). Her legacy evinces a “grass

Buddhism's Vajrayāna: Tantra, Fig. 2 Image of a Tantric yogini from a Tibetan *mandala* (Public Domain. <http://commons.wikimedia.org/wiki/File:Vajravarahi.JPG>)

roots” women-centered focus in Tantra that might surprise many scholars (Fig. 2).

In psychological terms, Tantra seeks to confront the passions rather than deny or repress them. Much as in psychoanalysis, this amounts to coming to terms with the id (the repository of instinctual drives) and/or the shadow (the negative aspects of our unconscious self). And just as in therapy, Tantric training traditionally takes place over an extended time in controlled environments, under careful supervision. Moreover, evidence suggests that overwhelmingly these rites have been conducted *mentally*, through visualizations, and are not about giving free reign to the passions. Rather, the training involves transmuting and sublimating the energy of lust, anger, and/or fear but redirecting it for constructive ends.

Another way to look at Tantra is as a paradoxical inversion of generally accepted social and cultural norms. Its complex techniques are designed to be employed as a way to confront deeply entrenched expectations surrounding

“religion,” “asceticism,” and “morality,” as well as the various attachments (emotional, institutional) that often accompany them. Unlike Western psychotherapy, however, Tantra does not focus on accepting desire as “natural” and “healthy” but works through desire towards a “desirelessness” state of awakening. This ultimate intention marks a seemingly unbridgeable divide between the two systems.

Even more interestingly, it may be that Tantra requires intentionally undergoing bouts of insanity. An example is in the practices of the “Great Perfection,” wherein the practitioner gives himself over to all the impulses arising into consciousness (Germano 1997, pp. 317–318). The idea is to transcend ordinary (false) “self” by entering into a frenetic period of intensely “samsaric” states, eventually leading to bodily and mental exhaustion known as “settling into naturalness” (*rnal dbab*). As one scholar describes:

It is essential that one yields to impulses in immediate and abrupt ways, rather than mentally directing and structuring activities. For example, one jumps and prowls like a wolf, howls like a wolf, and imitates its thought patterns . . . or one pretends to be a mass murderer and then suddenly switches to the outlook of a self-sacrificing saint. . . In short, one lets oneself go crazy physically, verbally, and mentally in a flood of diverse activity, so that by this total surrender to the play of images and desire across the mirroring surface of one's being, one gradually comes to understand the very nature of the mirror itself (Germano 1997, p. 318).

The key in such practice is maintaining detached awareness, even as this frenzy goes on. The time for such practice varies, but it typically entails several days of intense manic activity, briefly punctuated by moments of rest from all activity to “gaze directly at the mind.” The goal is ultimately to pacify mental obstructions, purify oneself of negativity, and awaken into the essence of Buddha. In Western psychological terms, this practice seems to involve intentionally cultivating a dissociative disorder, or even psychotic state. There may be some resemblance to the existentialist psychologist R.D. Laing's experiences and practices regarding schizophrenia (Laing 1967), but these sorts of practices would likely NOT be considered acceptable in Western clinical settings.

The role of the guru (Tibetan, *lama*) in Tantra also presents difficulties to outsiders. Idolization, or taking refuge as living Buddha, would seem to foster an unhealthy dependency to the point of infantilization and certainly is open to abuse (of which there are documented cases). Once more, these issues are particularly problematic when it comes to sexual yoga: how is it possible for a student to tell if his *lama* is truly qualified here? The current Dalai Lama once stated in an interview that only teachers who had no sexual desire whatsoever and whose equanimity was so great that they could drink a glass of urine as willingly as a glass of wine are advanced enough for sexual yoga with a consort. When pressed further, he also admitted he could not name any *lamas* he thought were at this level (Coleman 2001, p. 159).

Clearly the nature of Tantra is such that it poses major problems in a contemporary Western setting. In recent decades Vajrayāna has become increasingly prominent in the West, due to Tibetans fleeing their homeland in the wake of the Chinese invasion, the growing interest in “the East” since the 1960s and 1970s, and the high profile of Buddhist spokespeople such as the Dalai Lama. Many Tibetan texts have been studied and translated as well, and Tibet itself has become more accessible. For all these reasons and more, Vajrayāna promises to continue to attract popular attention. There can be no doubt that part of the attraction is the immense psychological power of Tantra. Vajrayāna is peopled with a dizzying array of figures personifying all manner of cosmic and psychic forces. Immersing ourselves in it carries us to the very outskirts of sanity, revealing both the fragility and preciousness of our personalities and the various conventions governing society.

Buddhist Chaplaincy

Jane Compson

University of Washington Tacoma, Tacoma,
WA, USA

Introduction

Buddhist Chaplaincy is a relatively recent phenomenon, having first appeared in the USA and the UK in the 1980s. However, it is quickly growing in popularity and has increasing representation especially in the fields of the military, healthcare, and criminal justice. Particularly in the USA, training programs in Buddhist chaplaincy have begun to proliferate in response to demand. Buddhist chaplaincy is rooted in the fundamental compassionate motivation to alleviate suffering. This entry will briefly describe the origin of chaplaincy in Christianity and its emergence in Buddhist contexts. It will describe accreditation and training and the roles of contemporary Buddhist chaplains. Despite the recent increase of Buddhist chaplains and training programs, little has been written analytically about chaplaincy and the study of this field is in its nascent phases.

History

The concept and role of a chaplain is rooted in the Christian tradition. The word “chaplain” comes from medieval Latin *cappella*, meaning “little cloak” and dates back to the Catholic Saint Martin of Tours in fourth-century France. A reluctant Roman soldier who wished, instead, to become a monk, St. Martin is known for his humility and compassion. This is exemplified in the account of him cutting his fine cloak in half with his sword in order to give it to a freezing beggar one winter night. Martin later had a vision of Christ wearing a half-cloak, which inspired him to leave the army and pursue a religious vocation. The half-cloak

(*capella*) became a sacred relic, and priests appointed by royalty to guard this and other relics became known as *cappellani*, or chaplains. (Encyclopedia Britannica 2015) Since then the role of chaplain has evolved considerably. For many centuries chaplains were typically associated with royal courts in Europe, where they provided pastoral and spiritual care. With the rise of industrialization, urbanization, and secularization, the role of chaplains has evolved considerably, although scholarly studies of this history are scarce.

Modern Chaplains

Although royal chaplains still exist today, in its modern usage the word chaplain generally refers to a lay or ordained representative of a religious tradition attached to a (usually) secular institution, such as a school, hospital, prison, or military unit. These public institutions (theoretically at least) are governed by norms associated with political liberalism, such as tolerance, pluralism, and respect for diversity, and chaplaincy is expected to conform to these norms. Thus, although most chaplains in history have been representatives of the Christian faith, they now represent many other world faiths (Cadge 2012). Todd (2011) explains that three types of chaplaincy have evolved in response to this secular turn. The first is ecumenical chaplaincy, or the collaboration of different kinds of Christian chaplain. The second is multi-faith chaplaincy, where representatives of different faiths provide chaplaincy services to people of their own faith tradition. The third is “generic chaplaincy” or “spiritual care,” where religious affiliation is de-emphasized and chaplains serve those of all faiths and no faith.

Buddhist Chaplaincy

The role of “Buddhist chaplain” seems to exist mainly in countries with significant Christian heritage where the “template” of chaplain already

exists. Conversely, “Buddhist chaplains” so described are less commonly found in predominantly Buddhist countries, although a program training clinical Buddhist chaplains has been running in Taiwan since 2000 (Chen 2012). Buddhist chaplaincy tends to fall into the categories of multifaith chaplaincy and spiritual care chaplaincy. In the context of the military and criminal justice (e.g., prison) systems, chaplains tend to operate more in the “multifaith” category in that they are appointed to serve the needs of Buddhist practitioners in their institutions. Healthcare chaplains, on the other hand, seem to fit more into the “generic chaplaincy” model, serving those of any faith or none. Buddhist chaplaincy has become increasingly popular in the USA and the UK since the 1980s. In both countries, the first Buddhist chaplaincies appeared in the context of the prison system, with the creation of the Angulimala Buddhist Prison Chaplaincy Organization in the UK in 1985 and the Prison Dharma Network (now the Prison Mindfulness Institute) in the USA in 1989. Subsequently, on both sides of the Atlantic Buddhist chaplains have begun working in the military and in healthcare. The first Buddhist military chaplain (Lt. Jeanette Shin) in the USA was commissioned by the US Navy in 2004. In the UK, in 2005 four “world faith chaplains” were appointed to serve the armed forces – Buddhism was one of the faiths represented, along with Sikhism, Hinduism, and Islam. None of them, though, are commissioned chaplains as these are currently drawn from the major Christian denominations only.

Training and Accreditation

Training and accreditation for being a chaplain varies according to the branch of chaplaincy (e.g., military, healthcare, etc.), the level of commitment (whether one is a volunteer or professional), and the country in question. Accreditation standards seem to be more rigorous and formulated in the USA, particularly in the context of healthcare. Most professional chaplaincy positions in the USA require board certification by the Association of Professional

Chaplains. This requires graduate level (Master’s degree or equivalent) in religious studies or theology, endorsement by a recognized religious faith group, 2 years’ worth (1,600 h) of supervised training in Clinical Pastoral Education (CPE) at an accredited site (such as a hospital), and 2,000 h of work experience as a chaplain. (Hickey 2012). In the UK, on the other hand, it is “desirable” but “not essential” to be an ordained minister in one’s own denomination, and while “demonstrable pastoral experience” is essential, the extent and depth of this experience is not uniformly stipulated. In the USA, training courses specifically devoted to training Buddhist chaplains have been established. At the time of writing, seven US institutions offer curriculum in Buddhist spiritual care, ranging from introductory courses suitable for volunteer chaplaincy to more involved programs offering graduate-level training for professional chaplains (Sati Center for Buddhist Studies, Upaya Zen Center, New York Zen Center for Contemplative Care, Institute of Buddhist Studies, Harvard Divinity School, University of the West, Naropa University). The curricula vary but include training in sacred literature, ritual and liturgy, pastoral care and counseling, and formal spiritual practice. Since chaplains have traditionally been in the Christian tradition, it can be difficult to work out what counts as equivalency in terms of certification standards. For example, chaplains are typically expected to be ordained, different Buddhist schools and groups vary in their definitions of ordination, and this does not necessarily have to mean one has taken monastic vows (Power 2012). The Association of Professional Chaplains Board of Chaplaincy Certification (BCCI) has written a white paper on Theological Equivalency to address some of these issues. (BCCI, n.d.)

The Role of Buddhist Chaplains

There are many different accounts of what it means to be a Buddhist chaplain, but a common theme in most descriptions is helping others to cope with suffering. For example, Block defines the purpose of a Buddhist chaplain as being “to

alleviate suffering in its many forms: physical pain, difficult emotions, and confusing or disturbing thoughts, more commonly known as agony, fear, anger, guilt, depression, loneliness, grief, and so on.” (Block 2012). There is less emphasis on intercession than there might be in theistic traditions and a strong emphasis on transformation through suffering: “As Buddhist chaplains, we do not serve as intermediaries or authorities per se, but as capable, steady companions who have investigated suffering through our own life experiences. So from our spiritual practice we lend patients our spirit and stability of mind for the possibility of their own healing, awakening and transformation.” (Block 2012).

Many Buddhist chaplaincy training programs include portions of training in methods and theory of contemporary Western psychology. Kinst 2012, for example, argues that in addition to sustained Buddhist practice, chaplains should develop basic counseling skills and understand basic concepts of Western psychology such as transference, counter transference, and the impact of trauma and depression. She also emphasizes the importance of self-reflection, interpersonal awareness, and self-care: “Undertaking an honest, kind, and intelligent investigation of characteristic personal and interpersonal patterns allow the training chaplain to develop a familiarity with his or her strengths, vulnerabilities and habitual tendencies, as well as an ability to track useful and distorting inner responses that may impact the care of the person in need” (Kinst 2012,).

Many descriptions of Buddhist chaplaincy emphasize the importance of bearing witness to suffering and meeting it with compassionate presence. Some chaplaincy training programs also place an emphasis on challenging systemic and social injustices and thus frame themselves as a form of Engaged Buddhism. For example, the Upaya Zen Center Chaplaincy Training Program defines the intention of its training as: “to prepare people to have the skilful means to transform all forms of suffering, including suffering induced by structural violence” (Upaya Zen Center).

The St. Martin origin story of chaplaincy epitomizes these dimensions of modern Buddhist chaplaincy. For example, St. Martin’s compassion

for the beggar demonstrates the importance of service and pastoral care. His ambivalence about being a soldier speaks to the relationship between the secular and the spiritual that chaplains must navigate in their roles. The different manifestations of Buddhist chaplaincy can be framed with reference to the Buddhist notion of skilful means, adapting the message to suit the needs of those one is serving, but guided by the overall motivation to alleviate suffering.

Buddhist Death Rituals

Kabir Saxena

Tushita Mahayana Meditation Centre, Delhi,
India

Nothing has more power than the stark fact of death to challenge our sense of embodied selfhood and our deep-seated need to cling onto life at all costs, sometimes even in the midst of much physical and mental pain. And nothing is more important for the Buddhist practitioner who accepts that there is continuity of consciousness after death than to understand and come to terms with that process of dying and its aftermath, gateway to the next life with its ever-fluctuating cycles of pleasure and pain. And for those left behind there is the strong wish not only to come to terms with the

loss, but even more to perform actions that aid and guide the consciousness to a happy state of rebirth within the six realms.

Buddhist death rituals are the outcome of a profound understanding of the entire process of dying, death, intermediate state (Tibetan *bardo*), and rebirth and aim to steer the dead person's mind away from confused projections that are regarded as the result of intentional action or karma motivated by ignorance, towards more clear, peaceful, and wholesome mental experience so that the person can achieve a human rebirth or higher in which the spiritual path can again be taken up on the journey towards personal liberation, *nirvana*, or the full enlightenment of a Buddha.

Although the numbers of rituals across the spectrum of the Path of the Elders or *Theravada* and Great Vehicle or *Mahayana* Buddhism may go into hundreds or even thousands, there would no doubt be a consensus that these rituals are, in the case of evolved practitioners, mainly for the benefit of the living. A realized person does not need a ritual of any kind to help them, for they can effect a happy passage to the next state of embodiment through the power of, for example, their genuine experience of love and compassion, their single-pointed mind of concentration (*samadhi*), deep faith in the Buddha and the teacher or *Guru* (literally “one who is heavy with knowledge”), and in some cases their ability to practice the technique of mind-transference or *phowa* at the time of death, enabling the practitioner to guide their own mental continuum to a pure land of bliss where a kind of effortless spiritual development is assured (Lama Yeshe 2011). In such a case all the rituals mentioned later in this entry are largely for the living to generate positive spiritual energy or merit and for their own peace of mind.

Needless to say, however, for the vast majority of more ordinary beings, certain rituals, prayers, and recitations are said to be crucial in helping the often disoriented consciousness of the dying/dead person to make a smooth transition to the next life.

The Stages of Death

It is essential to know the death process, (Rinpoche and Hopkins 1985), so the caregiver/ritual performer can gauge the stage the dying person has reached. For example, at the first stage of the so-called dissolution of the earth element, the body becomes thin and weak, the sight unclear, and the person is said to experience an inner appearance like a mirage. In the second stage, the water element dissolves, fluids dry up, mental and physical feelings become very vague, sounds cease, and there is an internal appearance like thin wispy smoke. Then the fire element dissolves, digestion and mental discrimination cease, one can no longer smell, and there is an internal appearance like sparks within smoke. Next the air element dissolves, respiration ceases, physical movement is impossible, and there is an inner appearance like a flickering flame about to go out. At this point one would be pronounced dead by a modern allopathic doctor. However, from a Buddhist perspective subtle consciousness may reside up to three days in the body, as the consciousness proceeds, or rather one should say, *dissolves*, to more and more subtle levels, experiencing inner visions of white and red light, then an appearance of darkness followed finally by the subtlest level which is like a very clear vacuity likened to an autumn dawn, called *the clear light of death or ground luminosity* (Dalai Lama 2002).

Rituals and Practices for the Dying and the Dead

The Tibetan Book of the Dead (Coleman and Jinpa 2007; Sogyal Rinpoche 2008) and the teachings in it, which are often recited out loud over the body of the deceased, are a time-honored guide aimed at steering the mind of the deceased through the labyrinth of mental projections and Buddha archetypes that one may face in the state between death and rebirth, a period that may extend, it is said, up to a maximum of 49 days. Every day up to the 49th monastics may be asked

to perform prayers and ritual offerings or *pujas*, or at least every seventh day until the 49th. The reciter reminds the person that they are dead, exhorts them to exercise mindfulness and not be afraid, to recognize all that appears as merely a display of the mind. The text also gives advice on what sort of pitfalls may arise, how to tackle them, which visions to follow and which to avoid in order to prevent an inappropriate rebirth. Such recitation of this seminal text, said to originate from the great adept Guru Padmasambhava in the eighth century CE, (Tsogyal 1993), may continue up to the 49th day after death.

Practices for death are most effective in a serene environment and emotional displays of grief are not encouraged. Mental balance and compassion for the departed having been generated, certain prayers and mantras are then chanted or recited out loud or quietly according to the particular practice. Here are some important ones from the Mahayana tradition of Buddhism:

1. The King of Prayers or the Extraordinary Aspiration of the Practice of Samantabhadra, is a very comprehensive prayer outlining the aspirations and practices of the Bodhisattva, a remarkable being who takes responsibility to attain Buddhahood in order to save all suffering beings from the repetitive round of uncontrolled death-rebirth, *samsara*. Reciting this creates much merit which is then dedicated to the welfare and happiness of the deceased.
2. The Dedication chapter of Shantideva's Guide to the Bodhisattva's Way of Life, (Padmakara Translation Group 2008), renowned for its vast and compassionate vision, acts in much the same way as the preceding prayer.
3. Prayers to be reborn in pure lands, such as that of Amitabha (Yeshe 2011), or other Buddhas.
4. Prayers to be able to continue one's spiritual practice in future lives, to meet up with qualified wise and compassionate teachers again and again, and to traverse all the stages of the path up to the attainment of Buddhahood itself.
5. Mantras, literally sacred syllables that have the power to protect the mind, are also recited. The practitioner then may blow on water, powder,

- or sesame seeds which are then sprinkled over the dead body (Lama Zopa Rinpoche 2008).
6. A blessed cord from a realized Lama, a sheet of paper inscribed with mantras and a *stupa* or reliquary filled with blessed substances and mantras are laid near or touching the body.
 7. The body is not moved unnecessarily and at the right time any hair at the crown of the head is given a firm tug. This facilitates the ejection of the consciousness from that spot, which is considered auspicious for a fortunate rebirth.
 8. The ashes and bones of the deceased can be blessed and consecrated in a practice called *jangwa* and then put into stupas.
 9. The relatives of the deceased may sponsor the making of statues or small images of the Buddha, (*tsa-tsas*), as well as paintings and the printing of texts, prayer flags. Donations to Buddhist temples and monasteries are also popular.

Last but by no means least, it's considered very powerful (and even essential, by some Lamas) to engage as much as possible in practices relating to the Medicine or Healing Buddha (skt. *Bhaisajyaguru*), the manifestation of Buddha energy especially dedicated to be of great benefit at this time when there is said to be a greater profusion of sickness, disease, and conflict rooted in destructive emotional patterns in the minds of living beings. There are short, medium, and long *Sutra* Rituals of the Medicine Buddha, the recitation of which can take from an hour to a whole day or longer depending on the text and the thoroughness of the practitioners. The mantra of the Healing Buddha is also recited extensively for its power to protect beings from unfortunate rebirth and plant the seeds of spiritual practice and the highest attainment of enlightenment (Lama Zopa Rinpoche 2001).

which texts are recited. While reciting, the monks may link a ribbon from the text they are reciting to the dead body, thus effecting a transfer of subtle spiritual vibration to the deceased. For the purpose of generating meritorious potential, it is not uncommon to sponsor the printing, publication, and free distribution of pamphlets and books of the Buddha's teachings. Feeding of the community of monks or sangha (and increasingly nuns also in the Mahayana domains) is also encouraged in order to generate a spirit of generosity and largesse that adds to the positive atmosphere in the days following death when the mind of the deceased can still be influenced in a beneficial manner by a variety of positive actions and protective measures (Langer 2007).

Underlying all these rituals is the firm belief that transfer of merit is possible (Gombrich 1987). This means essentially that people with a close connection to the deceased as well as those with pure ethics and motivation can engage in wholesome, spiritual actions sanctioned by the tradition and that these actions have beneficial effects that can be shared as it were with the consciousness of the departed. In all this we see how the profound and potentially traumatic event/process of dying and death is utilized as catalyst for activity aimed at benefitting the deceased short and long term, in addition to providing scope as therapeutic practice that enhances the spiritual inspiration of the living and engenders a mature acceptance of the inevitable. In some cases it is suggested that practices for the dead can continue years after death has occurred and still bring tremendous benefit. For this of course one needs the right practice, the right practitioner, a sufficient degree of attentional stability and a proper motivation of compassion allied with wisdom understanding the nature of reality (Dalai Lama 2008).

Rituals from the Theravada Tradition

These rituals are largely aimed at the same outcomes as above and mainly differ in terms of

Mythological Background

This mythic old woman appears under various names, most derived from Cailleach (Carlene, Cally, Cally Berry, Gy-Carling), a word generally translated as “hag” but which can also be rendered as the more contemporary “crone.” She is also known by personal names that refer to geographical regions (Garra-vogue, Echthge, Duineach, Corca Dhuibhne, Bronach, Nicnevin, Boi). Among many Irish geographical sites named for the Cailleach is the Ceann na Cailleach (“Head of the Cailleach”), also known as the Cliffs of Moher. Local legend holds that Cailleach was pursuing a young man with sexual intent, when her speed carried her over the edge of the cliffs and into the sea. Supposedly, her face can be seen on the most southerly of the cliffs. The deadly cliffs suggest something about the psychology of Cailleach’s ancient goddess legends here, paradoxically combining erotic excitement with end-of-life anguish. Many ancient goddesses included life and death in their scope (Fig. 1).

The Cailleach probably descends from a pre-Celtic divinity; she is not found among the continental Celts, but her lore is widespread in place names and legends in Ireland and Scotland. Her antiquity is suggested by the names born by the largest mountains in those lands (Slieve na Cailleach, Knockycallanan) and by legends that she created the landscape by dropping rocks from her apron or throwing them angrily at an enemy. Creation legends often are attached to the oldest divinities of a land, and settlement in Ireland preceded the Celts by some 4000 years. The Cailleach was said to have formed the islands off the southwest coast by towing land around with a straw rope; it broke and left the islands of Scariff and Deenish behind. Another tale tells how she struck an escaping bull with a rod as it swam away from her, turning it into an island of rock. The Cailleach was especially associated with high mountains, which often bear her name, most significantly the site of the important megalithic sanctuary, Slieve na Cailleach.

Although descriptions emphasize her age and ugliness (blue face, red teeth, and matted hair), the Cailleach was also renowned for her vigor and sexuality. In Ireland, she owned a farm and hired workers with the stipulation that none would be paid who could not outwork her. Many died of overwork trying to keep the pace she set. She appears in an important Irish myth in which Niall of the Nine Hostages boldly kissed a loathsome hag, at which she transformed herself into a beautiful young woman who controlled the land’s

Patricia Monaghan: deceased.

Cailleach, Fig. 1 Ceann na Cailleach (“Head of the Cailleach”), also known as the Cliffs of Moher (Public Domain. http://en.wikipedia.org/wiki/File:Lightmatter_cliffs_of_moher_in_County_Clare_Ireland.jpg)

sovereignty – a motif that has been interpreted as a poetic image of the land blossoming under the rule of a just king. A similar figure, the Loathly Lady, appears in Arthurian legend.

The Cailleach is associated with harvest rituals, her name given to the last sheaf cut, which was dressed in women’s clothing and kept as a charm for prosperity. The hag was also said to appear as a hare or other small creature; a shout went up from the harvesters as they approached the end of a field to “drive the Cailleach” into the next field. Such legends connect the Cailleach with agriculture, but some traditions suggest an earlier origin. In Scotland, a giant Cailleach lived on the milk of a deer. She guarded the wilderness and its animal life, punishing hunters who killed pregnant animals by choking them with their own hair. This figure, who resembles Greek Artemis, may derive from a separate aged goddess conflated to the Cailleach. This figure, called the Hag of the Hair or the Hag of the Long Teeth, was often accompanied by monstrous cats. In a story told in Scotland, the Cailleach befriended a hunter, permitting him to see which deer she struck in her herd, thus marking it as prey.

Psychology

Jungian theory describes “the feminine” and “the masculine,” arguably essentialist visions of

primal forces within both men and women that are reflected in world mythology and in art. Articulation of “the feminine” relies primarily on the work of Toni Wolff, Jung’s student and lover whose work was unfortunately subsumed under his name after her early death (Wolff 1956). In the United States, Anne Ulanov has been the primary popularizer of Wolff’s theory that there are four aspects to “the feminine,” which she describes as Mother, Amazon, Hetaira (courtesan), and Medial Woman (medium) (Ulanov 1971). In Wolff’s schema, the Mother and Amazon occupy opposite poles, while the Hetaira opposes the Medial Woman. Within this framework, the powerful sensuality of the Cailleach has no place, a lack that tends to be reflected in contemporary Jungian writers like Helen Luke; Jean Shinola Bolen is an exception to this trend (Bolen 2002).

Jung and Wolff based their work on available narratives and images from world mythology, which in fact does not offer many images of vital, creative, and sexual aging. The reason for such lack is unclear, as there is ample sociological and anthropological evidence that such women have existed throughout history and culture. If our gods reflect our lives, there should be many more enticing and creative crone goddesses. Selective recording of myths may have resulted in Cailleach-like divinities being excluded from the record or goddesses being interpreted

according to limited or negative stereotypes of women's aging.

Typically, kindly "crone" goddesses are described as sexless, even beyond gender; thus we find Hestia, ageless Roman goddess of community life, and Hebrew Sophia, similarly beyond age and gender but embodying wisdom. Many other aged goddesses are frightening, such as the Russian cannibal Baba Yaga and the child-stealing Bella Coola (Native Canadian) goddess Snēnē'ik; it is possible that the original figures were more complex and that this limited vision represents later more patriarchal cultural values. A few figures offer more complex iconography or mythology, such as Hindu Kali who, despite wearing a necklace of severed heads, is honored as the consort of the creator god Shiva. The Cailleach offers a similarly multivalent image of the aging woman: undeniably aged, she remains physically strong, with huge appetites for sex and food, and bursting with creative power.

The American women's spirituality movement has developed a ceremony honoring the postmenopausal period of a woman's life. Called a "croning," the event typically celebrates the promise of a woman's aging years as full of passion and power. Although such ceremonies are frequently tied to the cessation of menses at menopause, many women wait until retirement or completion of family duties to decide that they will accept the term "crone." The ceremonies are individually created, with no specific template other than the needs of the woman in question. Commonly, an altar is erected, often decorated with photographs of inspiring aged women; the event itself can include meditation, drumming or other music, and a symbolic passing over by the new crone from one state of being to the next. The Cailleach is an increasingly popular image invoked at croning events.

Cain and Abel

Mark William Ennis

Clinton Ave., Reformed Church, Bergenfield,
NJ, USA

Cain, according to the Hebrew Scriptures, is the first human being born on the earth, the first child of Adam and Eve who were created out of the dust of the earth by God. Qur'an tells a similar, although not identical, story of Cain and Abel. The name Cain in Hebrew means "I have gotten a man from the Lord." Cain was a tiller of the land

as was his father, Adam, following Adam's expulsion from the Garden of Eden. In the course of time, a younger brother, Abel, was born. The once only child now became an oldest child. Unlike his father and his older brother, Abel became a shepherd of sheep.

The day comes when Cain and Abel each bring offerings to God. God finds Abel's offering acceptable, but God finds Cain's gift unacceptable. Many have speculated as to why one offering was acceptable and the other not. Perhaps this reflects a culture that valued pasturing animals over that of land-based farming. Perhaps it is because Abel brings the first of his animals while it is not specified if Cain's offering was the first fruits. Maybe it shows God valuing younger, less powerful people at the expense of the older or more influential. This theme is not uncommon in Hebrew scripture. Jacob is the younger of two sons but becomes the inheritor of their father's estate as well as the father of Israel. Likewise, King David was chosen to be king of Israel over and against his older brothers.

The fact is that we cannot know for certain the reason for the rejection of Cain's offering. But, from my point of view, the more interesting question is how Cain reacted to this rejection.

One can glimpse the family system approach of Bowen in Cain's reaction. Reminiscent of his father, Cain seeks to externalize his difficulties. Adam, when confronted by God for his eating of the forbidden fruit in the Garden of Eden, seeks to blame Eve and, by extension, God himself for his failing. Likewise Cain sees the fault in Abel and somehow seems to believe that the death of his brother will make his offering acceptable. Instead, he gains further isolation, and his brother's blood even poisons the earth. True to Bowen, the toxins of a sick family trickle down and contaminate the family in subsequent generations as well as affect the superfamily system.

One may also gain a foreshadowing of Alfred Adler's examination of birth order in this story. In Adlerian thought, the oldest child is an achiever who considers subsequent children as a threat to his place in the world. In this particular account,

the older brother is indeed supplanted in worth by the little brother. This ancient story is a tale of sibling rivalry within the context of a fallen family contaminated by parental sins. Cain is ultimately trying unsuccessfully to please a creator father while staving off the rivalry of a brother and suffering from the contamination of his human father.

Cain's reaction to this rejection is murder and the subsequent estrangement from the only community that he loved. Here we see a personality disorder as described by Rotter. Had Cain developed a mature personality with a strong internal control mechanism, he might have avoided becoming a murderer.

Cain, with a stronger personality, with the strength to reject his family pattern might have received the answer that we find unanswerable, "God what can I do to make my sacrifice acceptable?" He might have altered his history and not become the world's first murderer.

Call, The

Alice Mills

University of Ballarat, Ballarat, VIC, Australia

The call to adventure is the first stage in the monomyth, when the hero is summoned to undertake a quest. The monomyth is a pattern of hero quest narrative developed by Joseph Campbell in *The Hero with a Thousand Faces* from a host of fairy tales, myths, and other sacred tales that span millennia and cultures. Campbell points out that not all hero quest narratives contain all the features of the monomyth, but the call to adventure is omnipresent in these narratives. Sometimes the hero only recognizes the summons in hindsight, and if the tale has a trickster element, it may be well hidden. A helpful and wise guide sometimes explains the call to the prospective quester, but it may also appear, as in some Biblical examples, to be an incomprehensible demand outraging common sense. The call may summon the hero towards a specific task, such as killing a dragon; it may take the form of an epiphany, profoundly transforming the individual's perceptions and understanding of self and the world; some calls to adventure are aversive, when the hero's dissatisfaction with the status quo propels him or her into a quest for change. The call always announces the prospect of change, whether for a kingdom or an individual soul.

The monomyth hero quest can also be understood as guidelines for the psychological hero quest that, in Jungian thinking, every psyche should undertake. The call for adventure would then be a summons alerting the psyche to unconscious contents that are ready for the work of integration that Jung terms individuation. In this sense, the call to adventure may come in such forms as a generalized dissatisfaction with ordinary everyday life or disturbing dreams, an illness, or retrenchment from a job. Jung's *Red Book* begins with his personal account of one such hero quest, beginning with a call to

adventure in the form of a recurrent, disturbing waking dream or vision. While the mythic monomyth very often involves a youthful hero, the Jungian hero quest can be undertaken at any age. The hero in the mythic monomyth is an extraordinary individual, but for Jung, the hero quest is a path available for all human beings, since all have a shadow in need of integration. As Campbell's pattern shows, while individual hero quest stories may deal with only one quest and have a "happy ever after" ending, the hero quest as a pattern should be regarded as cyclic. When one quest is ended, the next call to adventure may well occur. For the individual psyche, the call to adventure, to recognize and integrate shadow contents, is not a call to achieve complete integration then and there; for Jung, there is always more shadow to emerge and be integrated.

Calvinism

Jaco Hamman

The Divinity School, Vanderbilt University,
Nashville, TN, USA

Calvinism refers to a particular understanding of the Christian faith and an approach to the Christian life first articulated by the French Protestant

theologian, John Calvin (1509–1564). Subsequently, it has been upheld in Protestant Christianity's reformed tradition by persons such as John Knox (Scotland), John Bunyan (Britain), and Jonathan Edwards (America) (McGrath 2007).

Calvinism has five basic beliefs: (1) Humanity is totally deprived due to original sin, (2) God unconditionally elected those who will be saved to receive eternal life, (3) Jesus Christ has died for those who were elected by God, (4) the Holy Spirit pours irresistible grace over those saved, and (5) believers will persevere and are eternally saved in Jesus Christ. For Calvinists, the sovereignty of God reigns over all aspects of a person's life: personal, spiritual, intellectual, political, and economical. Education informed by Calvinist dogma is important as is distinguishing the sacred from the secular (Spencer 2002).

Calvin believed that knowledge of self – realizing one's depravity and need for salvation – and knowledge of God lead to wisdom (McMinn and Campbell 2007). Following their founder, Calvinists generally judge psychologies harshly in light of God's sovereignty and humanity's deprivation. They often question the philosophical foundations and models of personhood, health, and abnormality of most psychologies (Browning and Loder 1987).

Camino de Santiago

R. Jane Williams

Moravian Theological Seminary, Bethlehem, PA, USA

The Camino de Santiago (*The Way of Saint James*) is a 1,000 km route used by pilgrims for over 1,100 years to reach the Christian holy site of Santiago de Compostela. One of three major Christian pilgrimage routes popular in medieval times, the Camino leads from the Pyrenees on the border of France and Spain through northern Spain to the legendary site of the remains of Saint James, an Apostle of Jesus Christ, beneath the altar of the Cathedral of Santiago. A 100 km portion of the Camino extends west from Santiago de Compostela to Finisterre on the Galician coast of western Spain. Finisterre was known to the Romans as “Finis Terrae” for it was the end of the known world in their time.

Santiago de Compostela was founded in the ninth century as a sacred site associated with the Apostle James. A shower of falling stars had led a hermit to a buried marble tomb containing bones identified by a local bishop as the remains of St. James, seizing upon the discovery as an opportunity to increase the devotion of local peasants. Alfonso II, king of the region of Asturia, made pilgrimage to the site and in 814 CE built a small wooden chapel as a resting place for the relics.

At first, the chapel at Santiago de Compostela was only a place of local pilgrimage for those within less than a day's travel. Increased attention to Compostela came as a result of a victory over Muslim invaders in 844 CE. Christian troops had called on St. James for aid in battle and

subsequently routed the invaders. St. James was given credit for the victory, became known as “The Moorslayer”, and was celebrated as a heroic protector and patron saint of Spain. Loyal Spaniards now had motivation to travel great distances on pilgrimage to honor St. James at Compostela. Soon, the small wooden chapel was enlarged to become a Basilica and the center of a new Archbishopric.

From its founding in the tenth century through the fourteenth and fifteenth centuries, the Camino pilgrimage to Santiago de Compostela grew in popularity along with other pilgrimage routes. From the first days after Jesus Christ’s death, travel to Jerusalem and to sites connected with his life and death was undertaken as a way of paying homage and seeking spiritual renewal. After Constantine’s fourth-century edict making Christianity a state religion, pilgrimages to Rome and other sites were considered equally as efficacious as those to Jerusalem. When travel to Jerusalem became more complicated with the rise of Islam and eventually the Crusades, pilgrimages continued to increase, but the focus shifted to less dangerous sites. By the twelfth century, the number of pilgrims on the Camino rivaled those who traveled to Rome or Jerusalem.

Pilgrimage on the Camino was not an easy journey. Through its early history, the Camino was rural, lacked roads or amenities, and involved a journey of a year or more. In the ninth and tenth centuries, pilgrims risked death at the hands of robber bands, could be attacked by Muslim Moors who had conquered southern and central Spain, often contracted and died from plague and other infectious diseases, and perished from exposure and starvation. Pilgrims set out on such journeys with priestly blessings and tears from their loved ones who were quite convinced that they might never meet again.

So why risk so much to journey to a burial site? Then as now, pilgrimages to sacred sites were a part of the practice of one’s spirituality: a means of personal and spiritual transformation, a ritual of penance, a rite of passage, and a way to demonstrate one’s religious devotion. The Roman Church encouraged pilgrimage as an obligation of the faithful to journey to a designated sacred

site at least once in one’s lifetime. Pilgrimage was also a way for the Church to benefit financially through the purchase of pilgrim indulgences that would forgive a specific sin or that gave lifetime forgiveness for pilgrimages made during Holy Years when a saint’s day fell on a Sunday.

Pilgrimages, with all their risks and dangers, could give a sense of the lessening of one’s burden of guilt and an opportunity for a new start to pilgrims, especially poor peasants, whose lives offered little hope of redemption and ease. In an era without any idea of the therapeutic value of confession, penance, or making amends, pilgrimage allowed for a lessening of the sense of isolation that a burden of guilt creates. Pilgrimage offered a first taste of freedom for many on the Way. Stepping outside their local environs for the first time, pilgrims walked beside persons from a variety of locales, differing social strata, strange languages, and foreign cultures (Stopford 1994). On the Camino, as on any pilgrimage trek, social hierarchies were sacrificed to the greater need to help and be helped on the path. Because a pilgrimage required months on the road and was accomplished under great hardship and uncertainty, it nurtured an experience of community and equality of station that was a foreign concept to everyday medieval life.

Pilgrimage on the Camino also brought physical and social transformation along the path and when pilgrims returned home. The Camino de Santiago had originally followed ancient Roman roads, but as the tenth century passed into the eleventh century, the old path became crowded with pilgrims making their way to honor St. James. Recognizing that the needs of such large numbers of pilgrims was overwhelming the farmers and villagers who lived along the largely unpopulated rural path, the Church (with the aid of some secular rulers) began to establish religious houses along the way that could house and feed pilgrims. Medieval hospitals (which served a function like today’s hostels) likewise offered food and shelter. Monastic orders, secular rulers, and ordinary townspeople collaborated in building bridges and creating passable roads. To provide security from thieves and criminals, medieval orders of knights arose (Stopford 1994).

Numbers of pilgrims on the Camino peaked in the twelfth century, and by the time of the Protestant Reformation in the sixteenth century, pilgrimages had fallen out of favor. Serious blows were dealt to the practice of granting indulgences for completed pilgrimages by reformers including Martin Luther. Political instability and an aborted attack in 1589 by Sir Francis Drake on the Galician capital La Coruña, just 40 miles north of Compostela, also caused the numbers of pilgrims to slow to a trickle. News of the attack so panicked the Dean of the Cathedral of Santiago that he hid the relics of St. James so invaders would not find them. Unfortunately, when the danger was over, no one else could find the remains. The reason for making a pilgrimage to Santiago de Compostela had disappeared, and the Camino itself was soon reclaimed by farm fields and the towns and villages to which it had given birth.

When the bones of St. James were rediscovered 1879 during repairs to the Cathedral, pilgrimage was no longer a spiritual priority. A reawakening of interest in the Camino de Santiago pilgrimage did not come until the mid-twentieth century in part a response to publication of a three-volume history of the Camino (de Parga et al. 1948). Still, only a trickle of pilgrims walked the Camino until the Holy Year 1965. In that year, *Friends of Estella/Amigos de Estella* was formed by scholars interested in historical research and reclaiming the Camino for travel by contemporary pilgrims. The Camino, which had been inhospitable to modern pilgrims, was opened up to pilgrimage again as the Amigos and a Galician priest, D. Elias, published the first contemporary guidebooks and maps, began to mark the Way with yellow arrows, and persuaded towns and monasteries along the way that preserving ancient structures, setting aside the path, and providing hospitality to pilgrims would be to their economic advantage. In 1993, the Camino de Santiago was recognized as a World Heritage Site. By 2010, a Holy Compostelan year when the July 25 Saint's day occurred on Sunday, over 250 million pilgrims walked the Way.

Why is the Camino experiencing such a crush of pilgrims in an era when established religion is decreasing in attendance and practice? The increase may reflect a deep spiritual hunger in a world where materialistic ambitions no longer

satisfy spiritual longings. Pilgrimage offers a spiritual and psychological experience of transformation that is available to any person willing to set out on the journey. As one steps outside of familiar surroundings and the demands of work and relationships, a time of self-reflection and listening for inner truth sets in. The pilgrimage path becomes a form of walking meditation, allowing one to experience the present moment and to be aware of the numinous quality of existence.

Similar to labyrinth, walking the Camino offers metaphorical insights into one's life journey. Whether one sets out to experience the solitude of the trail, seeks healing of soul or body, longs for forgiveness, looks for spiritual or emotional renewal, pursues an experience of the Holy, or hopes to experience a sacred site, the Camino offers life lessons on the pilgrimage.

One learns, first, that the path changes from moment to moment: uphill, downhill, smooth, rocky, uneven, noisy beside trafficked roads and in the middle of town, and still in a green forest. One cannot know what the path will be in an hour, a day, or a week – as in our lives what is present will not last – and sometimes that is a good thing.

On the Camino, as in life, it is good to speak an encouraging word to others – and to hear it in return. *Buen camino* meaning “good pilgrimage” is the common greeting and is understood by all regardless of native language.

One soon learns to carry only necessities – water, a little food, sun protection, and a sweater – and be willing to give up anything if it becomes too heavy in one's backpack. What is truly essential is easier to learn on pilgrimage than in daily life.

Yellow markers or arrows or scallop shells point the Way on the Camino, but as in life one needs to be alert for them so they are not missed. Pilgrims too engaged in internal or external conversation who do not attend to the present moment often end up on the wrong road and spend precious time trying to find the Way.

Other pilgrims are never strangers and are often walking companions. If solitude is needed, walk alone. If companionship is needed, walk with others. As in life, ask for what you need.

Pilgrims do not get to choose daily traveling companions. Whoever is walking the path that day is one's companion for the day. As in life,

there is always something to learn from a companion if one has ears to hear.

Whether it is octopus (the local delicacy), Galician goat cheese pizza, or a breakfast of hardboiled egg and hard rolls, food on the Camino is always adequate, sometimes amazing, and often not what one expects. As in life, try it all, or you will miss something delectable.

On the Camino, as in life, what one needs often appears when you think you cannot go any further – like the coffee shop with a bathroom that appears on the path at just the right time.

To walk the Camino, one needs only a sturdy pair of broken-in hiking boots, a walking stick, water, and a pilgrim passport. For Americans, the pilgrim passport (*credential*) can be obtained through American Pilgrims on the Camino http://www.americanpilgrims.com/camino/credential_req.html. Citizens of other countries can obtain the credential through Confraternities of St. James in their own country. Pilgrim passports enable pilgrims to stay at low-cost shelters or *alburgues* (hostels) along the Camino. Each town and alburgue along the Camino has a unique stamp to add to the passport. In Santiago de Compostela, the Pilgrims Office issues a *Compostela* to each pilgrim who has walked at least 100 km and has a valid stamped credential. The *Compostela* attests to completion of the Camino pilgrimage and to this day is an official indulgence for those who have walked the Camino for religious reasons.

Campbell, Joseph

Anais N. Spitzer

Department of Religious Studies, Hollins University, Roanoke, VA, USA

Joseph Campbell (1904–1987) is one of the most widely recognized scholars of mythology. The public television series *The Power of Myth* (1985–1986), consisting of interviews with Bill Moyers, propelled him into the public spotlight. A follow-up book, published posthumously, (Campbell 1988) increased his popularity and catapulted his earlier work, *The Hero with a Thousand Faces* (1949), onto the *New York Times* best-seller list in 1988. George Lucas' public acknowledgment of Campbell's work as inspiration for the *Star Wars Trilogy* cemented Campbell's place in the popular canon. Although many of Campbell's ideas have been embraced by the public at large and his importance has been recognized beyond the walls of academia, Campbell is no less a scholar. That he spent most of his life as a teacher and academic, along with the rigor of his work and its subsequent use among scholars, affirms the pertinence of his ideas to the study of myth within the academy.

Life and Scholarship

The oldest of three children, Campbell was born in New York City in 1904 to Irish Catholic parents. In 1910 Campbell's father brought him to see Buffalo Bill's Wild West show, igniting a lifelong interest in Native America religions. He quickly exhausted the share of children's books on the subject and by age 11 was already reading Bureau of American Ethnology reports.

Early on, Campbell was an avid reader, excellent student, and gifted athlete. In 1921, he enrolled in Dartmouth College to study biology and mathematics, but, after discovering the humanities, he transferred to Columbia University as an English major in 1922, earning a Bachelor of Arts in 1925. A member of the Columbia track team, he set the school's half-mile record.

In the summer of 1924, while en route to Europe, Campbell met Jiddu Krishnamurti (with whom he sustained a lifelong friendship) who introduced him to Buddhism and Hinduism. This early encounter with Eastern religions had a lasting impact on Campbell's life and scholarship.

In 1926, Campbell returned to Columbia University to pursue a Master of Arts in Medieval Literature. His thesis, "A Study of the Dolorous Stroke," was supervised by the Arthurian scholar Roger Loomis. Hungry to continue his studies but already aware that his interests crossed disciplinary boundaries and were incompatible with the specialization a Ph.D. would require, he traveled on a Proudfit Fellowship to the University of Paris to study Romance philology and later to Munich where he learned Sanskrit. Campbell became enthralled with the European intellectual milieu that led him to the works of James Joyce, Thomas Mann, Leo Frobenius, Sigmund Freud, and C. G. Jung. All of these figures would later come to influence his theory of mythology and his writing and teaching.

Campbell began his teaching career at Sarah Lawrence College in 1934, beginning his career-long acclaim as an exceptionally skilled and popular teacher. His first major publication was *A Skeleton Key to Finnegans Wake* (1944), coauthored with Henry Morton Robinson. Another highly influential figure in Campbell's life was the German Indologist, Heinrich Zimmer, whom Campbell met in 1941. A speaker (along with a plethora of other famous intellectuals from across the globe) at the prestigious Ascona, Switzerland-based Eranos Conferences, Zimmer introduced Campbell to Paul and Mary Mellon, founders of the Bollingen Foundation, which later published many of Campbell's works. The Mellons solicited Campbell to write the commentary to the first book of the Bollingen series, *Where the Two Came to Their Father: A Navaho War Ceremonial* (1943). After Zimmer's unexpected death in 1943, Campbell was put in charge of editing Zimmer's posthumous writings, a project that took 12 years and yielded four volumes. During this time, Campbell presented two important papers of his own at Eranos: *The Symbol Without Meaning* (1958) and *The Renewal Myths*

and *Rites of the Primitive Hunters and Planters* (1960). He also edited a series of volumes consisting of papers presented at the Eranos conferences. In the summer of 1953, while in Switzerland, he met Jung for the first time.

Campbell retired from Sarah Lawrence in 1972 and moved to Honolulu where he continued his research and writing. A few of his works from this period include *The Inner Reaches of Outer Space: Metaphor as Myth and as Religion* (1986) and *The Mythic Image* (1974). During this time he also completed *The Power of Myth* interviews. He died of cancer in 1987.

Notable Works

Campbell's studies in literature, the psychology of Freud and Jung, anthropology and Eastern religion informed his famous study of hero myths, *The Hero with a Thousand Faces*, which employed Joyce's idea of the monomyth in its examination of hero myths across the globe.

One of Campbell's most significant works of comparative mythology is the four-volume *The Masks of God* (1959–1968), a study of "primitive," "oriental," "occidental," and modern literary, "creative" mythology. On the one hand, the volumes set out to "view the cultural history of mankind [sic] as a unit" and to "compose into a single picture the new perspectives that have been opened in the fields of comparative symbolism, religion, mythology, and philosophy" (1959, p. 3, 4) by tracing worldwide reoccurring mythological themes. On the other hand, the volumes carefully assert that "the myths of differing civilizations have sensibly varied throughout the centuries" (1959, p. 18) in such a way that the virtue of one culture's mythology is the vice of another, and one's heaven, another's hell. In other words, Campbell warns in his prologue, "mythology is no toy for children... there is a real danger, therefore, in ... joining the world in a single community, while leaving the anthropological and psychological discoveries from which a commensurable moral system might have been developed in the learned publications where they first appeared" (1959, p. 12), making note of the fact

that his comparative study was cognizant of the importance of historical differentiation and the dangers of morphological parallelism and historical diffusion.

At the end of his life, Campbell undertook another comparative study, producing the richly illustrated two-volume *Atlas of World Mythology* (1983–1989), which further extended his studies of the historical origin and diffusion of myths.

Theory of Myth

For Campbell, myth functions symbolically, as “energy-releasing, life-motivating and – directing agents” (1959, p. 4; 1969, p. 178). Mythology reveals a psychological truth that shows itself in stories and images. Underlying the historical and cultural particularities of mythology is also the potentiality for shared meaning across time and culture that exists because of the psychological and metaphysical underpinnings at work in the stories and alive in the human spirit. Campbell believed that myths are of nature – that is, they are part of the very structure of human biology and the psyche – and although they manifest within and are influenced by culture, they are not exclusively of culture (as Claude Lévi-Strauss proposed). For Campbell, the gap between nature and culture is bridged by myth. Nature is not only out there in the world beyond the human, but it is also within. Myth unites the inner world with the outer. Toward the end of his life, Campbell summed up myth as the “experience of life” (1988, p. 5). This later statement echoes Campbell’s insistence that the interpretation of mythology is anything but systematic. In fact, in *Hero with a Thousand Faces*, he uses the shape-shifting god Proteus as a metaphor of mythology in order to suggest that mythology is psychological, historical, anthropological, and metaphysical and cannot be reduced to a single function.

Myths – including mythic discourse and thinking – can function in one of two ways: as a symbol “functioning for engagement” or as a symbol “functioning for disengagement, transport, and metamorphosis” (Campbell 1969, p. 169). Campbell carefully elaborates these two functions in his

1957 Eranos lecture “The Symbol Without Meaning” by drawing on the metaphor of a bow that serves either to engage or disengage meaning. When the symbol is given a meaning, “either corporeal or spiritual, it serves for the engagement of the energy itself” (Campbell 1969, p. 178). As an agent of engagement, myth works to confer meaning. In this way, it can be read as a “literature of the spirit” that provides one with “clues to the spiritual potentialities of the human life” (Campbell 1988, p. 3, 5) that aligns the individual with society (in particular, the collective unit of family, religion, tribe, state, and nation) and the cosmos. Myth unites the inner with the outer and shows how each is mirrored in the other.

However, when the symbol functions to disengage, myth does not provide any assurance of meaning. When “all meaning is withdrawn, the symbol serves for disengagement, and the energy is dismissed – to its own end” (Campbell 1969, p. 178). Rather, myth evokes an experience of existence instead of positing a specific meaning that always runs the risk of being taken dogmatically. In fact, Campbell frequently warns against interpreting the symbolic literally and even argues that such literalizing is absurd (and potentially even dangerous) in a “de-mythologized” world (1969, pp. 124–126). Inasmuch as myth can reveal the previously unknown, making it known and bringing it to consciousness, it can also point to the unknown as unknowable.

Criticism

The bulk of negative criticism of Campbell’s work comes from academics in the fields of religion and folklore and stems from one basic complaint about his hermeneutic of comparativism. Many detractors have simplistically likened him to Mircea Eliade and Jung on the issue of archetypes and universals, equating the psychological with the universal and ahistorical in order to argue that Campbell’s comparativism is unscholarly (dismissed by Wendy Doniger as “Muzak mythology” (Doniger 1992, p. 78)) since it overlooks historical and cultural particulars in favor of generalizations.

In his 2004 Presidential Plenary Address to the American Folklore Society, Alan Dundes takes aim at Campbell's "universalizing," arguing that some mythological motifs do not exist in all cultures. To support his assertion, Dundes cites the lack of a deluge myth in sub-Saharan Africa as one example. Earlier in his speech, however, Dundes does emphasize the point that interpretation "would not have been possible without recourse to grand theory" (2005, p. 4), of which "universalizing" is a key part. In the same speech, Dundes also credits Campbell "for getting people interested in our discipline" (2005, p. 10).

David L. Miller forcefully argues that these claims against Campbell do not bear closer analysis because Campbell was neither a Jungian nor unaware of the importance of historical differentiation. Invoking Plotinus' *Enneads*, Miller avers that Campbell's method is that of comparing the likeness of unlike things (i.e., of finding similarity within inherent difference), as opposed to the likeness of like things (1995, pp. 168–177). Miller points out several pivotal and often neglected parts of Campbell's scholarship that affirm this, adding that Campbell's choice of language in the titles of his books (a 1000 faces as opposed to one face, masks of God) subtly points to the complexity of Campbell's approach.

Robert Segal has also made the case that Campbell is not a Jungian and that, in fact, his theory of myth differs significantly from Jung's (1990, pp. ix–xi; 1987, pp. 244–262; 1999, pp. 463–465). Furthermore, Segal calls into question the flippant dismissal of comparativism, asserting that "any theorist – of myth, religion, or anything else – is a universalist" in some way (1999, p. 463) and lists James Frazer, Northrop Frye, Bronislaw Malinowski, and Claude Lévi-Strauss as some offenders who are not always subjected to the same scrutiny as Campbell.

Capps, Donald

Joseph M. Kramp

John Jay College, New York, NY, USA

Biographical Information

(1939–) Formerly William Harte Felmeth Professor of Pastoral Psychology at Princeton Theological Seminary, Donald E. Capps is a prolific American (USA) psychologist of religion and pastoral psychologist. Capps, raised largely in Oregon and Nebraska, received his secondary education at Lewis & Clark College (B.A., 1960), Yale Divinity School (B.D., 1963; S.T.M. 1965), and the University of Chicago (Ph.D., 1970). Capps' Ph.D. dissertation was a psychological biography of John Henry Newman, focusing on Newman's adolescence and his vocational struggles that culminated in his conversion to Roman Catholicism. In spite of Capps' prolific writing and publishing tendencies, this dissertation was never published, though Capps has authored numerous articles on Newman, some of which were built off of his dissertation research.

Capps' academic career started as Instructor at the Department of Religious Studies at Oregon State University during the summer of 1969. He then became Instructor and Assistant Professor at the Divinity School of the University of Chicago between 1969 and 1974. Later, he was appointed Associate Professor at the Department of Religious Studies at the University of North Carolina, Charlotte, NC, where he lectured between 1974 and 1976. Between 1976 and 1981 he was Associate Professor and then Professor at the Graduate Seminary of Phillips University.

An ordained minister of the Evangelical Lutheran Church of America since 1972, Capps joined the faculty of Princeton Theological Seminary in 1981, where he was appointed the William Harte Felmeth Professor of Pastoral Psychology. In May 2009 he retired with the status of Professor Emeritus but remains at Princeton Theological Seminary lecturing as adjunct. Capps has a long list of honors and

awards he has accumulated over the course of his career. In 1989 Uppsala University in Sweden awarded him a degree of Doctor honoris causa in Theology for his contributions to the field of Psychology of Religion. Other honors include the William F. Bier Award for contribution to Psychology of Religion, granted in 1995 by the Division 36 of the American Psychological Association; the Helen Flanders Dunbar Centennial Award, granted in 2002 by the Columbia-Presbyterian Hospital in New York; and the Joseph A. Sittler Award for Theological Leadership, granted in 2003 by Trinity Lutheran Seminary.

Capps has also done a considerable amount of work for various academic professional associations over the course of his career. Capps was the book review editor for the *Journal for the Scientific Study of Religion* between 1980 and 1983 and editor for the same journal between 1983 and 1988. Additionally, between 1990 and 1992 he was the President of the Society for the Scientific Study of Religion.

Capps' Thought: Four Salient Trends

First Trend: Erikson's Influence and Psychohistorical Method

Capps' most clear and obvious theoretical influence in his early years of writing is Erik H. Erikson. Erikson's psychohistorical method provided the methodological basis for Capps' Ph.D. dissertation, and Erikson's life cycle theory was directly relevant to Capps' own intellectual and professional development, where he vacillated in his graduate study between the professional commitments of becoming a minister or pursuing further study for the teaching profession. While he would later become both an ordained minister and a professor, this questioning of professional fit at that time in his life made Erikson a theorist of great interest to Capps. Prior to returning to Yale for the STM, Capps spent 1 year in Berkeley, CA, at the UC Berkeley Ph.D. program in philosophy before deciding that he wanted to return to Yale for further study with James Dittes. The year with Dittes studying

Erikson and developmental psychology proved extremely influential, as Capps then accelerated through the doctoral program at University of Chicago, graduating and defending his dissertation within the psychology and religion concentration in 4 years. In Capps' own experience of vocational confusion, Erikson's writings on vocational and identity confusion came to be of critical importance.

Capps' interests in Erikson's psychohistorical method, life cycle theory, and religious studies, as well as pastoral theology, led to his penning of several foundational texts in the field of pastoral psychology, among them *Pastoral Care: A Thematic Approach* (Capps 1979) and *Life Cycle Theory and Pastoral Care* (Capps 1983). Texts such as these begin to appropriate Erikson's work on religion, history, biography, and the life cycle for the theological community. Capps has never ceased to be influenced by and reflect on Erikson, particularly Erikson's life cycle theory as well as his psychohistorical methodology. This is clear from some of his major later career publications such as *Jesus: A Psychological Biography* (Capps 2000) and *The Decades of Life: A Guide to Human Development* (Capps 2008). Both of these texts rely considerably on either Erikson's thought or his methodology.

Second Trend: A Desire for Personally Meaningful and Relevant Study

Close readers of Capps' work develop not only a sense for his scholarly approach but also for how the answers Capps arrives at are forged through a process of critical self-reflection that he openly shares with his readership. This is one of the central, unique ways in which Capps manages to convince readership of his arguments and their significance. Two examples will suffice. In Capps' (2000) work, he dedicates the book to himself – or, rather, the boy within himself:

My favorite Bible verse in boyhood was John 14:6. . . . In the course of writing this book, I was mindful of the desire to keep faith with this boy and have done so, I believe, by striving to write a study of Jesus that was not afraid to ask questions in search of a more reliable truth. This book is dedicated to him (Capps 2000, p. xiii).

Throughout the course of this text, we learn of Capps' developing understanding of Jesus from child to adulthood and how this, in conjunction with historical analysis, informs Capps' verbal portrait of Jesus. A second example comes from Capps' (1995) *The Child's Song: The Religious Abuse of Children*. In this (1995) passage, Capps writes of his desire to be another man's son and how he realized that this desire was the dawning of his own religious consciousness:

I also found myself reliving the blame I had placed on my mother for her role in activating this desire to be another man's son, as she frequently belittled her husband in the presence of her children. . . . Yet I believe this desire in me to be another man's son was the beginning of my own religious consciousness (Capps 1995, p. 113).

As with the example from Capps' *Jesus*, readers not only are engaged in critical study of the subjects Capps undertakes but are also accompanying Capps himself in his own process of critical self-reflection on the experiences of his life.

Third Trend: Melancholia and Humor

Capps authored a number of works reflecting and building upon Freud's 1917 essay, *Mourning and Melancholia* (Freud 2001). Capps argues that melancholia is primarily a condition experienced by men, as they are forced to separate from their mothers. While he does not discount the experience of melancholia among women, he argues that the etiology of the condition is different and the focus of his studies is on men's experience of melancholia. Capps begins to build upon Freud's 1917 essay by arguing that religion serves as compensation for the emotional loss of mother in early childhood. As the loss of mother is reexperienced over the course of the man's lifetime in the experiences of trauma such as loss of spouse, loss of occupation, or separation from family of origin at the time of marriage, religion becomes the compensatory mechanism to manage these experiences where melancholic self-revilement becomes most intense. For Capps, all these traumatic experiences mentioned are grounded in the original experience of separation from mother, ensuing melancholia. The critical

question for Capps, then, is what form this religion, a compensatory mechanism, takes. He argues that, in general, it will take one of three forms (honor, hope, or humor) though one individual could practice one or more of these forms at different points in their lifetime. For Capps, the religion of humor is ultimately the only religious type able to successfully manage the self-revilement that accompanies melancholia.

With the experience of melancholia comes the threat of self-loss. Capps began to recognize this in the late 1980s when he began to write on the issue of narcissism and Heinz Kohut's self-psychology. Capps' (1992) work, *The Depleted Self: Sin in a Narcissistic Age*, applies Kohut's work on narcissism to the understanding of sin in the Christian churches. This book was given brief screen time in the popular American movie *Seven* (1995) with Morgan Freeman and Brad Pitt as they chase down a serial killer obsessed with the seven deadly sins. This example from popular culture suffices to show the enduring admiration for Capps' work, both inside and outside the academy. Capps' interest in narcissism, religion, and culture would lead to a number of important publications that return to the questions surrounding religious leadership and the method of psychohistory that Capps had begun examining in graduate school. In the last decade, Capps has also continued to build on his writings on religion and humor. Capps' interests in humor have extended beyond its ability to manage the melancholia experience but also to help one reason with greater skill, to relieve somatic pain, and to experience overall well-being.

Fourth Trend: Mental Illness and Creativity

Capps' interests in religious leadership naturally lends itself to an interest in mental illness because psychohistorical methodology is focused on examining the psychological struggles of religious and cultural leaders as they fashion new social roles and participate in social reform. Capps (2000) makes this connection between social reform and mental illness explicit in his work, showing how fantasies of power such as symbolic religious constructions can be used to propel social reform movements, as in the days of

Jesus. Fantasies of power – which do not reflect accurate assessments of one's self identity or abilities – are also used by mentally ill individuals to separate themselves from painful social situations and the construction of a social identity, examined astutely by Capps (2010) in his *Understanding Psychosis*. Capps' interests in mental illness and religion, thus, reveal the ubiquity of mental illness in culture, if only varying in degree. This point is perhaps most clearly shown in Capps' (2010) work where he compares his own mental processes to that of an individual suffering from a mental illness (Capps 2010, p. 26) in order to show how common and normal the experience of mental illness is. Capps' purpose is not to conflate religious practice with mental illness, so as to disparage religious practitioners, but rather he makes this comparison to show how dignified and normal it is to have a bout with mental illness or delusion.

Capps' collected writings on mental illness and religion provide insights into the mystery of mental illness for individuals, how individuals and social groups can manage mental illness, as well as the psychosocial consequences of mental illness on social and cultural populations. Capps' interests in mental illness lastly can be tied to his interest in poetry and the creative arts, as these are commonly identity-producing activities that engage the individual's religious sensibilities and vulnerably expose the details of their struggle. Capps' work on individuals and their lives rests itself upon a claim that individuals are perhaps better known through their personal writings and works of art, rather than in their lifetimes by their peers. In other words, Capps suggests that because of the unearthing of personal journals, we may come to know the dead better than we ever knew them as living beings. Capps shows that this is because individuals are far more revealing of themselves in their private journals and their public works than they might ever find comfortable with even the most intimate persons in their lives. As such, Capps' work may be collectively characterized by his interests in the secrets people tell but rarely expect to be heard. Given the merits his work has earned, he could aptly be described as a good listener and an astute observer.

Caribbean Religions

Susan Love Brown
Department of Anthropology, Florida Atlantic
University, Boca Raton, FL, USA

Introduction

The Caribbean region consists of those coastal areas of Central, North, and South America that border on the Caribbean Sea, along with all of the islands between the Caribbean Sea and the Atlantic Ocean. The area is culturally rich because of the combination of indigenous peoples, European colonialists, African Slaves, Hindi indentured servants, and other immigrants who have found their way over the years. The region consists of people speaking Spanish,

English, French, Dutch, and a variety of Creoles. Because of this diversity, the Caribbean also has a great deal of religious diversity. Often this diversity has created hybrids of European and African faiths, such as Voudon and Santeria, as well as new religions, such as Rastafarianism. This article examines the dynamic history behind religion in the Caribbean and its legacy in the present day, the psychological functions of religion in this particular context, and the role of altered states of consciousness in some new Caribbean religions.

Native Caribbean Religions

The indigenous peoples of the Caribbean region were the Taino (sometimes referred to as Arawak), who occupied the islands of the Greater Antilles, and the Caribs, who occupied the Lesser Antilles. The Tainos were horticulturalists who were animistic, infusing nature with spirits (called *zemi*) that were spiritual beings often represented in objects that were carried around (fetishes). Taino shamans (called *bohito*) practiced healing and retribution against enemies. They also tapped into impersonal forces in the universe, animatism (*mana*), and they engaged in a number of religious rituals. The Carib, who moved into the Caribbean after the Taino, were also animistic and were often their adversaries (Bisnauth 1996).

Much of what we know about the religion of these early inhabitants of the Caribbean islands, we have extrapolated from studying similar groups in South America who survived the initial encounter with Christopher Columbus and the Europeans who followed him and from archeological studies. Although some Tainos survived the European arrivals, that was mostly in the northern islands, such as Puerto Rico. Those who inhabited the Bahamas (the Lucayans) were totally vanquished within a decade after the encounter.

After the arrival of the Spanish, many of the Caribbean natives were converted to Christianity. However, due to disease, enslavement, and murder, many of the indigenous peoples died and their religions along with them.

European Religions in the Caribbean

Catholicism was first brought to the Caribbean by the Spanish. By the beginning of the sixteenth century, the Franciscans (1502) and Dominicans (1510) had set up monasteries and were converting the Indian peoples to Christianity (Bisnauth, p. 15). Spain extended its religious dominance of the Caribbean by Papal consent.

Other Europeans brought their religions and their political disputes to the Caribbean with them. The Portuguese (Catholicism), the French (Huguenots, who were Calvinists, and Catholicism), the English (Anglican Church and Presbyterianism), and the Netherlands (Dutch Reform Church) were all contenders for the establishment of their Catholic and Protestant religions in the Caribbean. Judaism came to the Caribbean in the sixteenth century with Jewish immigrants from Spain and Portugal to where they, in turn, had come from North Africa. Many ended up in the Portuguese colony of Brazil, while many of the Sephardim who sought exile in the Netherlands, ended up in Dutch colonies in the Caribbean, such as Curacao, St. Croix, St. Kitts, Jamaica, and other colonies (Hylton, p. 223, 226).

For many of the Europeans, religion became an excuse to exploit native Taino and Carib labor, to expropriate lands, and to exterminate any opposition. Columbus, for example, was responsible for the depopulation of those islands that were not valuable to him, for example, the Bahamas, Aruba, Bonaire, and Curacao (Hylton, p. 18), exporting their populations to Hispaniola, although many died of disease and outright murder. In fact, so abusive were the Spanish religious leaders to the natives that Bartolome de Las Casas, while working successfully to abolish the enslavement of native peoples, recommended the enslavement of Africans.

Religion often serves a number of psychological functions, but in the face of radical change, such as that native Caribbean and later African populations underwent, religion imparts coherence to disrupted life patterns, provides a sense of community, and serves as a refuge from the

pain and suffering brought about by the invasion and usurpations that occurred.

Slavery, Religion, Hybridity, and Altered States of Consciousness in the Caribbean

With the massive importation of slaves from the continent of Africa, came the indigenous religious beliefs and practices of their African cultures. It was Bartolome de Las Casas who recommended in 1517 the importation of African slaves. The African slave trade had begun with the Portuguese in the fifteenth century and was quickly extended to the New World colonies by Europeans. Although religion was often used to justify slavery, the Europeans often ignored and denigrated the existing religious beliefs of the Africans they took to the New World. Inevitably, the religions imposed on the Africans melded with their own religions, resulting in syncretic religions, also referred to as creole or hybrid religions.

According to Fernández Olmos and Paravisini-Gebert, “These creolized religious systems, developed in secrecy, were frequently outlawed by the colonizers because they posed a challenge to official Christian practices and were believed to be associated with magic and sorcery. They nonetheless allowed the most oppressed sectors of colonial Caribbean societies to manifest their spirituality, express cultural and political practices suppressed by colonial force, and protect the health of the community” (p. 3).

Two key examples are the rise of Haitian Vodou and Cuban Santería.

Haitian Vodou

Haiti, the French colony of Saint Domingue on the island of Hispaniola, thrived as a sugar colony. It was also known for the high death rate of its slaves. A new slave had a life expectancy of about 7 years (Fick 1990). While Haitian slaves were imported from a variety of places and had Catholicism forced upon them, they managed to retain their own culture and religious beliefs, adapting

them to the new environment and creating the religion of Vodou (also known as Vodun and Voodoo). Meaning “spirit” or “sacred energy” (Fernandez Olmos and Paravisini-Gebert, p. 102), the new religion reflected the practices of the Dahomey and the Yoruba, as well as other African groups. This religion played an important part in creating a psychological cohesiveness among the disparate groups of African slaves.

Under the leadership of houngans, or Voudon priests, the religion became a rallying point that would eventually create the psychological foundations of the Haitian revolution. Vodou provided a refuge from the harsh treatment experienced on sugar plantations. After the revolution, Vodou would find its strength in the small villages made up of extended families, which also created great variation in practices of Vodou across Haiti after the revolution (Fernandez Olmos and Paravisini-Gebert, p. 103). Although Vodou did incorporate some aspects of Catholic practices due to the baptisms mandated before the revolution (Fernandez Olmos and Paravisini-Gebert, p. 104), it is clearly distinct from Catholicism in its structure and origins and in its array of loas, who are sometimes represented in the garb of Catholic saints.

Vodou is also distinct in the practice of spirit possession, an altered state of consciousness that constitutes a key part of religious ritual. But it also serves to allow its practitioners to assume different roles in order to achieve goals. “If we interpret the spirit identity as an alternate set of roles for the person, under appropriate ritual conditions, it is clear that such a set of roles makes it possible for the individual to modify the situation in which he or she must live, to introduce changes in the social framework of his own life,” notes psychological anthropologist Erika Bourguignon (1973, p. 30). From a psychological perspective, then, religion helps to create ritually sanctioned conditions for change, thus binding the individual to the group.

The Catholic Church left Haiti in 1805 but returned in 1860. Throughout Haitian history, Vodou and its practitioners were subject to intermittent persecutions, including the imprisoned or killed and their places of worship destroyed (Fernandez Olmos and Paravisini-Gebert,

p. 105). Today, both religions are practiced in Haiti, which was made possible by the recognition of freedom of religion in Haiti’s 1987 Constitution (Fernandez Olmos and Paravisini-Gebert, p. 105).

Cuban Santeria

According to Fernandez Olmos and Paravisini-Gebert, the rise of Santeria in Cuba can be accounted for by the predominance of Africans from the Yoruba peoples of southwest Nigeria. The practice of the prescribed religion was also undermined by the lax attitudes of both priests and slave owners themselves. The Catholic churches themselves served as a foundation for the growth of hybridity among African slaves, who often gathered under its auspices with members with similar backgrounds. The very systems created by the state to control slaves became the source of syncretism.

“The cabildos were the site where Africans and their descendants transformed the institutional structures available to them to support their own African cultural and religious practices; they borrowed from Catholic discourse and reinterpreted it in terms of African religions under the guise of an alternative form of folk Catholicism” (Fernandez Olmos and Paravisini-Gebert, p. 29). Thus, Santeria (also known as Regla de Ocha) was born. *Santeros*, or followers of Santeria “venerate the Yoruba deities called *orishas* or *santos*, syncretized with Catholic saints” (Fernandez Olmos and Paravisini-Gebert, p. 30). “Slaves worshiped Ogun, the protector of blacksmiths in Africa, as a deity of war; Chango, the warrior orisha, became identified with exacting justice. In like fashion others would reflect qualities of self-identity and legitimacy valued by people living in oppression. . .for almost nearly every orisha there is a correlating Catholic saint based on associations made by slaves between the mythology of the orishas and attributes or qualities identified with Catholic saints, particularly as perceived in the iconographic representation of the latter in the statues. . .” (Fernandez Olmos and Paravisini-Gebert, p. 34). Like Vodun, Santeria is

characterized by spirit possession. Its rituals also involve the sacrifice of animals often for purposes of divination.

The religions of Vodun and Santeria, with their roots in the African religious practices of the Yoruba and Dahomey, came into being to provide continuity between the traditional spiritual practices that were part of African culture and the new environments with the imposed Christianity of states and slave owners. But this hybridity was more than simple accommodation; it offered psychological relief from the oppression of slavery and later from the often repressive conditions of life in both Haiti and Cuba.

Rastafarianism

Rastafarianism was a new religion founded in Jamaica in the 1930s. The religion recognizes Emperor Hailie Selassie (originally known as Ras Tafari) as the messiah and Africa as the source of future hope and prosperity, while in turn rejecting the modernization going on in Jamaica and the disruption of the lives of the poor peasants (Chevannes 1994). In many ways, developing its own symbols in dreadlocks, the ritual use of ganja, and the return to an agricultural way of life in the community of Pinnacle, Rastafarianism was the product of a revitalization movement that arose in response to the changes wrought by the worldwide Great Depression, the extreme poverty of the peasants, and the loss of their way of life through industrialization (Lewis 1993).

The roots of Rastafarianism can ultimately be found in the maroon and revivalist traditions of Jamaica (Chevannes 1994). Although Leonard Howell is generally considered the first Rasta (Lee 2003), others contributing to the development of Rastafarianism were Joseph Hibbert, Archibald Dunkley, and Robert Hinds. Following the destruction of the community of Pinnacle, founded by Howell, the movement returned to Kingston, eventually achieving worldwide recognition. Its symbols – beards, dreadlocks, and the ritual use of ganja – signified their status of outcasts (Chevannes 1994). Rastafarianism provided a means of escaping the oppressive

conditions of peasant life, as did the ritual use of ganja to shift the consciousness of its practitioners.

Spirit possession has been recognized as a form of dissociation that is taught and consciously induced in order to achieve spiritual goals that also provide temporary psychic escape from the conditions of life. Altered states of consciousness often serve to provide a broader view of existence and even hope. Henney reported “temporary periods of dissociation” in which members of a fundamentalist Protestant church, the Shakers of St. Vincent, take “spiritual journeys.” She reports: “Shakerism has demonstrated its strength by its remarkable persistence throughout years of opposition and hostility – a strength that seems to stem, at least partially, from the refuge it offers its adherents from the reality of, and psychical injury from, socioeconomic deprivation” (p. 219).

With decolonization of the Caribbean came the liberalization of religion. Although many of the customary religions remained in place, the rise of new religions and their eventual routinization continues to make the Caribbean an extremely religiously diverse part of the world. But even so, the psychological aspects of religion continue to be an underlying motivation for their perpetuation.

Castration

Stefanie Teitelbaum

Faculty of National Psychological Association for Psychoanalysis (NPAP), New York, NY, USA
Institute for Expressive Analysis (IEA),
New York, NY, USA

Castration is defined as any action, surgical, chemical, or otherwise, by which a male loses the functions of the testes or a female loses the functions of the ovaries. Castration is also referred to as gelding, neutering, orchiectomy, orchidectomy, and oophorectomy. Traditional definitions of castration refer primarily to the physical removal of the testes.

Freudian castration refers to the Oedipal boy's fear that his father will cut off the boy's penis to punish him for incestuous wishes towards his mother. This fear is a central factor in assuring an incest taboo and in the creation of the superego, the psychical agent of morality and civilization in Freud's (1924) structural topology of the psyche. Psychoanalysts in Freud's lifetime, post-Freudians, and psychoanalytic feminists have

elaborated, revised, and/or reviled his phallogocentric position. Current views of castration anxiety may include all psychosexual erogenic zones and functions in men and women and to injuries to a person's self-esteem.

Judaism, Christianity, and Islam share prohibitions about mutilating God's creations. Psychology and religion share thoughts about castration and/or fear of castration serving to free the spirit from the forces of instinctual gratification. The two disciplines also share difficulties with ambiguous interpretations differentiating physical and symbolic castration.

Religion

Olympian Creation Myth

At his mother Gaia's urging, the Titan Cronus castrated his father Uranus. Uranus sought sexual gratification every night but hated the children conceived by his lust. The goddess of love and beauty, Aphrodite, was formed from the foam of the severed testicles in the sea.

Paganism

The priests of Cybele castrated themselves as early as 415 BCE as a sacrifice to purify the soul and transcend the demands of passion, society, and family in order to reach the divine.

Judaism

In Deuteronomy 23:1, castrated men are expelled from the assembly of Israel.

Christianity

The Gospel According to St. Matthew (19:12) includes a quote of Jesus, in which he says that there are men who make themselves eunuchs for the kingdom of heaven's sake. St. Augustine of Hippo argues against a literal reading of Matthew 19:12 indicting physical castration as a return to Cybellene cults, an assault on manhood, and a mutilation of God's creations. Bostock (2003) called Augustine “the anti-Origen,” referring to the early Christian scholar who acted on a literal reading of Matthew and castrated himself. In Europe, women were not permitted to sing in

church choirs and boys were sometimes castrated to preserve their pure soprano voices. Such boys were called castrati. In the late nineteenth century, the Roman Catholic Church took a formal position that castrating singers is a mutilation of the body and therefore a sin.

Islam

A hadith, the oral transmission of the words and deeds of Muhammad, orders the physical alteration of the female genitalia in language unclear to both Arabic- and English-speaking people. Two of the ritual procedures rising from that hadith, clitoridectomy and excision, have been termed female castration in modern times (Badawi 1989). The Qur'an forbids alteration of Allah's creations and calls such practice the work of Satan.

Psychology

Psychiatry

Biological castrations have been performed on men and women to control deviant sexual behavior and masturbation primarily in the nineteenth century, although such practice was never widespread. Chemical castration to control deviant sexual behavior is a current treatment. Auto-castration has been observed an onset indicator of schizophrenia, and one such patient incorporated Matthew 19:12 in his delusional system (Meyers and Nguyen 2001; Waugh 1986). The question of madness was raised in the Cult of the Gates of Heaven whose members castrated themselves prior to a mass suicide in preparation to return to God.

Psychoanalysis

Freud (1911/1955) analyzed the written work of Daniel Paul Schreber (1903/1955), whose delusions included castration so as to become God's wife. Freud viewed this work through the lens of his Oedipus complex. Castration anxiety and symbolic castration are primary forces to repress instinctual and/or id impulses towards forbidden and gratifications, particularly the taboo of incest. A son gives up his sexual desire for his

mother for fear of castration by the father. The superego, the internalized father conscience and guardian of civilization, evolves in response to castration anxiety and eliminates the need for the totem father. Freud thought of women as castrated beings, therefore with a weaker superego structure. The threat of castration has no authority to the already castrated. A child experiences shock and horror at seeing the castrated mother and fearing that such castration will happen to him. The Freudian fetish is an object which serves to disavow knowledge of the castrated mother. The mother, who in the infant's fantasy has a penis, is the preoedipal phallic mother. The experience of castration anxiety is necessary to resolve the Oedipal phase. Freud postulated that penis envy is the girl's counterpart of the boy's castration anxiety (1913/1955, 1923, 1924/1955, 1927/1955).

Eigen (1974) amplified Melanie Klein's (1975) concept of preoedipal castration anxiety and part objects. Klein amplified Freud's (1905/1955) ideas of psychosexual zones and the child's lack of differentiation of penis, feces, and baby (1926) and the experience of the loss of the breast (1917/1955). Any psychosexually significant body part or function which a child holds dear, which is filled or cathected with libido, is subject to loss by a castrating godlike mother. The breast, experienced by the child as a part of his/her own mouth; the anal sphincter and its feces; the urethral sphincter and its urine; and an imaginary internal penis for boys and girls are Kleinian part objects. Jacques Lacan (1973/1981) added voice and gaze to the Kleinian part object inventory.

Guervich (1999) amplified Lacan's rereading of Freud, which among many things, aimed to correct Freud's blurred inner and outer reality boundaries and defined castration in purely psychological terms. Lacanian castration is to be cut off from the *jouissance*, defined as both orgasm and excess, of identifying with and having the imaginary phallus of the preoedipal phallic mother and/or the phallus of the father who possesses the mother. Within this model, both boys and girls need to undergo this castration and accept that the mother desires the father's real anatomical penis. This castration is necessary to accept the reality of the external world and to form language.

Psychoanalytic feminists have found the revised phallus concept as a gateway to incorporating Freud in postmodern psychoanalysis.

Commentary

The earliest castration story, the son Cronus, urged by his mother to castrate his lustful, unloving father to create a pure allegorical woman representing truth and beauty, foretells millennia of struggle within psychology and religion to modulate the sometimes mutually exclusive demands of satisfying the flesh and satisfying the soul. Freud sought to solve this problem in his concept of sublimation and the fear of castration contributes to the sublimation process. Biological castration as a religious purification is the extreme enactment of soul-body dualism, devoid of symbolic resolution.

Freud posited circumcision as a symbolic substitute for castration (1909), and castration anxiety holds a central position in Freud's religious and cultural texts as well as the texts about the unconscious. Jonte-Pace (2001) used Freud's uncanny (1919), the psychical experience of something missing, to theorize a rival hypothesis to Freud's phallogocentric thinking. In this formulation, the uncanny relates to both the circumcised/castrated Jewish male and the castrated preoedipal phallic mother. These castrated beings induce castration anxiety in Gentile men encountering the castrated Jew and in any man encountering the castrated woman. Castration anxiety is thus a causal factor in both anti-Semitism and misogyny. While Freud himself explored the relationship between castration anxiety and death anxiety, Freud's father-centered theory may have been an eroticized defense of his fear of death at the hands of the woman as mother, wife, and death figure.

Von Franz (2000) explored the archetypal role of the castrating mother in her explication of Jung's puer aeternus. The eternal youth is symbolically castrated by a symbiotic, infantilizing mother and sacrifices his manhood to remain his mother's beloved boy. In both a modernist Freudian as well as Jungian reading, the puer aeternus, a castrated boy in fantasy, may be male or female in

external reality. While Melanie Klein's work on the castrating mother sought to express the power of a mother god to the infant, the castrating, phallic woman is often a representation of misogyny.

St. Augustine (1467), in his rejection of a literal reading of Mathew 10:19, said "What then doth all that which remained of (Atys) after his gelding signify?" Augustine's use of signification anticipates Lacan, postmodern feminism, and psycholinguistic signification's role in gender identification challenging Freud's omnipresent "anatomy is destiny." Muslim women are regularly gelded and are still signified as women. Men and women are gelded in lifesaving surgeries and still retain their gender identities. Melanie Klein's all-powerful castrating mother god is an iteration of Freud's all-powerful castrating father god, opening gender ambiguity of god figures, a parent god that is both male and female. "And God created man in His image, in the image of God He created him; male and female he created them" (Genesis 1:27).

Symbolic castration, the freedom of the demands of instinctual passions, opens the gates of heaven, beauty, art, and civilization to men and women.

Catharsis

Amitabh Vikram Dwivedi
College of Humanities and Social Sciences –
Languages and Literature, Shri Mata Vaishno
Devi University, Katra, India

Introduction

Etymologically, the term “catharsis” is derived from the Greek word *Katharsis*, meaning “purification,” “cleansing,” “healing,” “transforming,” and “purging.” Bharat’s *Natyashastra* and

Aristotle's *Poetics* discuss catharsis in their dramatic theories. Bharat states that drama evokes a particular aesthetic–emotional experience, i.e., *Rasa*, which deals with and transcends the problem of egoism, whereas Aristotle claims that dramatic experience is uplifting and edifying. Both Indian and Greek scholars argue that the process of purification leads to liberation.

Most of the definitions of catharsis emphasize four chief aspects: cognitive, psychological, emotional, and religious. Aristotle and Bharat discuss the emotional effect of catharsis in their dramatic theories. An almost similar connotation of catharsis is mentioned in medicine: Hippocrates considers catharsis as a purifying agent, and he associates it with healing. Breuer and Freud bring forth the cognitive and psychological aspects of catharsis in modern psychology by introducing the therapeutic method in their “catharsis therapy.” Finally, the religious aspect of catharsis is associated with practices such as attending sermons, confessions, reading scriptures, chanting prayers, fasting, observing silence, mourning, and beating and torturing oneself.

Catharsis and Psychology

Freud and Breuer describe catharsis as an instinctive and involuntary body process, whereas the American Psychological Association describes it as “the discharge of affects connected to traumatic events.” Scheff incorporates the idea of distancing into catharsis – cognitive awareness and emotional–somatic discharge – while emphasizing the components of catharsis. Similarly, Schultz and Schultz define catharsis as the process of eliminating a complex through conscious awareness. Most of the psychological theories claim that unreleased negative emotions get stored in the psyche, and they create pressure on the human system – so much so that these emotions increase hypertension, hysteria, and other mental disorders; therefore, venting of negative emotions is necessary to keep us healthy. Many psychologists and health professionals support the hydraulic

model, which is supported by an analogy of fluid flowing through the human body.

Catharsis and Religion

Religious texts add a spiritual aspect to catharsis, where the emphasis is on discharging harmful emotions from the head and the heart, so that followers can become pure. Mostly, religions consider human beings as sinful, and they provide prescriptions of dos and don'ts in the form of allowed actions and prohibited actions. Purification is generally performed in response to a diverse set of actions, circumstances, and objects: sex, birth, death, killing, disease, dirt, menstruation, bodily fluids, food, sorcery, prayer, adultery, and entry into religious places. Religions across cultures perform activities of purification with the help of sacrifice, prayer, food, water, blood, fire, pilgrimage, and changing of attire.

In Hinduism, *vrat* (“fasting”) is observed for many purposes: to please gods, to correct the metabolism of the human body, and to develop strong will and determination. Also, there are many types of fire sacrifices practiced in Hinduism to help seek the grace of a god as well as purification of the heart. In Christianity, the traditional “Sunday Mass” is a good example of providing relief to Christians and of increasing solidarity and social identity affirmation. In Islam, prayer, alms giving, the Ramadan fast, and pilgrimage to Mecca are compulsory for every Muslim. Further, the traditional religions have ceremonies such as curing rituals, funeral rites, and mourning, where cathartic activities such as crying, weeping, dancing, and drumming are performed so that the practitioners may convert negative emotions into virtuous dispositions.

Celibacy

Chaitali Choudhury
Department of Humanities and Social Sciences,
National Institute of Technology Rourkela,
Rourkela, India

Celibacy is derived from the Latin word *caelebs*, which originally means a state of being “unmarried” or “single.” The scope of the term, moreover, extends to complete abstinence from sexual congress with any man, woman, or animal, and the popular concept of celibacy encompasses the absence of sexual desire. In addition, celibacy is deeply rooted in religious philosophy and becomes a metaphor for chastity and purity structured in mental and physical landscapes. St. Augustine’s prayer, “Grant me chastity and continency, but not yet” (*Confessions*, VIII: VII, 17) suggests that celibacy is a significant means of coming to terms with sexuality. Having developed culturally, in time and space, it has become an important aspect of human existence – religious and secular – pulsating throughout people of all

ages. It has encompassed the sacred scriptures, political discourses, and medical literatures. Away from the antagonistic sensual self of erotic desire – often considered “impure,” “polluting,” “shameful,” and “evil” – celibacy is located in the purity of inner self, constructed in a psycho-sensual-spiritual synthesis by sublimating sexuality into spirituality. This spiritual reorientation of the self is shaped and given an expression through religion with its ritualized character which gives an insight and acts as a critique to multiple subjects such as psychology, spirituality, sexuality, gender, and sociopolitical discourses. It wafts through history under a legion of names – Athena, Artemis, and Hestia (Minerva, Diana and Vesta in Roman pantheon) in Paganism, St. Augustine in Christianity, lord Shiva in Hinduism, lord Buddha in Buddhism, Mahavira in Jainism, Talmudic rabbis in Judaism, and Sufis in Islam – all of them underwent psychological struggle against sexuality for a heightened sense of spirituality. In short, the concept of celibacy, which is redefined as “New Celibacy” in contemporary understanding of sexuality, is a new pattern of behavior towards physical and emotional closeness to one’s own self, others, and to God without sexual engagements.

The choice of marriage or singlehood and the choice of intimacy with or without sexuality remain crucial to the development of self-knowledge and self-identity. The expression of sexuality is manifested in its realization or in its renunciation as an individual’s internal adjustment to social attitudes and values. Whether or not sexuality or marriage is valued, it is perceived as a practical principle of civilization for its procreative role. But every sociocultural tradition emphasizes the moral grammar of sexuality. Consequently, celibacy is formed as a schema for the sexual self in response to sociocultural values. Celibacy is fashioned as an alternative but normal libido as opposed to popular assumption that human behavior is driven to sexual satisfaction. Hensel and Fortenberry (2014) term celibacy as “absence” and consider it “normal” in most humans at some point of life span. Sexual distress is an integral aspect of celibacy and it

occurs in one's celibate choice as a corollary of a mental conflict between sexuality and the decision for its control. Spiritual practices and religious backgrounds catalyze celibacy as a desire of asexuality by behavior in reducing this distress. But there is no clear evidence of the role of religion to reduce sexual distress in the process of celibacy. Sometimes it is said that nonreligious celibates feel less sexual agony than religious celibates.

The dynamics of celibacy has a spiritual motive, realization of asexual chaste self through the realization of divinity. Spirituality depends not on social norms or emotional states but on the acts of the psychological structure that each celibate self aspires to discover. The priest-psychologist Martin W. Pable (1975) contends that doubts about the culturally accepted things such as sexual relationship and marriage for self-development lead to celibacy. Celibacy develops a notion of alternative reality and identity with new social relations as a form of dissent towards the normative reality (Wimbush and Valantasis 1998). The operational forces of celibacy – personal images of body as “flesh” and soul as “spirit” and the subsequent responses to sexuality as “sinful” and spirituality as “ethical” – inject a sense of religion in persons. Celibacy thus can be described as facilitating an interaction with psychology, spirituality, and religion (Sipe 2007). It involves a process of integrating with one's sexual self after it proceeds from many phases of permutations, individualizations, perversions, failures, and frustrations. Scholars such as Louis Roy and Donald Goergen note that celibacy interacts with the psychic, social, and religious aspects of our being. From religious perspectives, celibacy is the most restricted aspect of sexual behavior. It is visualized to celebrate pleasure out of the pain caused by the deprivation of sexual desires and austerities imposed on the body.

Celibacy is generally perceived as a voluntary act, but several internal distinctions such as vocational and philosophical, mandated and facultative, complete and partial celibacy exist. Its significance varies according to historical contexts, religious traditions, and cultural purposes (Olson 2008). Celibacy is largely understood and over-represented as a religious phenomenon.

Some religious traditions, viz., Hinduism, Buddhism, Jainism, and Christianity, preach and practice divinity by the paradigm of celibacy whereas some other religious traditions such as Islam and Judaism refuse to admire the celibate model of divine practice. In the Western context, celibacy refers to continence for the “kingdom of God.” Within the Eastern context, celibacy is regarded as a pure state of being to stop the endless cycle of rebirth and to attain *moksha*, *nirvana*, or complete spiritual liberation. Celibacy has spread to Japan, China, Vietnam, and Korea with Buddhism. Celibacy has also been visualized as a method of nonviolence by several cultural icons such as Mother Teresa, Mahatma Gandhi, and Dalai Lama. In the Eastern and the Western philosophies, sexuality is thought to be degrading physical and mental power of humans leading to their misery. Consequently, the concepts of holiness and purity are sought to make a person complete, perfect, and hence powerful. These three ideas – holiness, purity, and (divine) power – are thought to be embodied in Hindu ascetics, Buddhist monks and nuns, Sufi mystics, and Roman Catholic priests.

The genesis of celibacy in most of the select religions – Christianity, Hinduism, Buddhism and Jainism – lies in the mental struggle against and responses to the perceived notion of sexuality as lustful, destructive, and hence sinful. Though each of these religious thoughts prescribes marriage and sex as important elements for certain stages of life with a sense of existential purpose, they endorse celibacy as the sine qua non of eliminating the mental agony of lustful sex and for gaining purity, chastity, potency, and spiritual liberation. Paradox of obsession with sexuality and its overcoming remains central to celibacy. In Hinduism, two of lord Shiva's popular images – a semen conserved phallus raised upwards and a bumpy crescent or horns on his head – portray this paradox. Erotica and celibacy – *kama* and *tapas* – coexist in Hinduism. Shiva is the prototype of sexuality and celibacy. He is considered as both a *yogi* (ascetic) and a *bhogi* (sensualist) (O'Flaherty 1969). On the one hand, he is believed to be free of passions. Conversely, it is told that Shiva married Parvati with the power of

his asceticism, renunciation from sexual activity, and gratification. On the mortal plane, celibacy approximates to *brahmacharya*, which literally means entailing a conduct towards realizing Brahman, the Absolute. From a broader perspective, it refers to sexual renunciation and purity in thoughts, actions, and speeches (Sivananda 1934). Semen-anxiety, preservation of vital fluids, and channelizing of sexuality into spirituality for physical and mental vigor, potency, and higher knowledge are concepts of celibacy in Hinduism. The modern Hindu mystic Ramakrishna Paramahansa (1836–1886) characterized the sexual/spiritual duality in his practice of married celibacy, *kundalini* and sacred transvestism. In Christian theology, this duality is also evident in the collective image of Eve as the archetype of “Original Sin” and in the decarnalization of Mary as an attempt of self-purification from the sin. Based on beliefs of prelapsarianism and the New Age of the Christ, the Church Fathers – Ambrose, Jerome, Tertullian, Cyprian, and Augustine – and the Apostle Paul embraced celibacy as an act of symbolic castration from sexuality to make themselves asexual “eunuchs” for the holy kingdom, as it was preached by Jesus. (Matthew 19: 12). But a psychological conflict “to wed or not to wed” has become a central focus of Christianity right from the origins of the Jesus movement when celibacy became a Christian faith to the present debate regarding the legitimacy of clerical celibacy in Roman Catholicism. A concern to save the “superior soul” from the perceived “wicked passions” initiated celibacy into pagan vocabulary as it was introduced by the Pythagoreans long before the advent of Christianity. Monks and nuns of three Buddhist disciplines – *Theravada*, *Mahayana*, and *Vajrayana* – have to follow celibacy for spiritual practice in accordance with the *Vinaya* which proscribes all forms of sexual activity, including masturbation and nongenital contact with the opposite sex. For a lay follower of Buddhism celibacy is a voluntary conduct.

In Jainism, celibacy is also a route to salvation. The last and greatest of 24 teachers of Jainism Mahavira brought forth the ideal of celibacy to the center of his philosophy. Both Judaism and

Islam endorse sexuality within marriage. But celibacy has a place – though minor – in these two religions. Some Talmudic rabbis took the vow of celibacy to study the Talmud, the body of Jewish civil and ceremonial law (Abbott 2000). In Islam, the Sufis swear to follow a celibate way of life. It is believed that Shamans and Vodoun priests and priestesses communicated with spirits with the power of their supposed celibacy. In Hinduism, Buddhism, Jainism, and in Christianity, women were earlier viewed as “seductive temptresses,” but there is a long tradition of female celibacy in each of these beliefs. Transcendence of gender, emancipation from the stereotypical burdens of marriage, motherhood and private space, and a sense of autonomy define female celibacy. Christian celibacy gives women a broader sense of independence. Desert Mothers, Beguines, St. Catherine of Siena, Ann Lee of Christianity, Mirabai (1498–1546), a Hindu mystic singer of *Bhakti* cult and Brahma Kumaris (daughters of Brahma) of Hinduism are notable female celibates. Hijras of India embrace celibacy to create a pure third gender identity but their practice of prostitution alludes to ambivalence entwined in the concept of celibacy.

Celibacy is sometimes employed as a tool of coercion. The Middle Eastern “Female Genital Mutilation” and “honor killings” are examples of the extreme forms of celibacy. Nevertheless, celibacy – which creates a perennial fascination all over the world – is now modified as “New Celibacy.” It is perceived as a personal choice to adopt an unconventional way of life. True Love Waits, BAVAM of Western philosophy and Siddha Yoga Path of Eastern philosophy are movements of New Celibacy. The decision for celibacy is appropriate for specific categories of people who voluntarily renounce their sexuality in the twenty-first century. But throughout the ages, celibacy has been viewed as a mental condition in which sexuality is not utterly eliminated but it is directed not to its original aim but to the alternative. Consequently, religion forms a focal site of manifesting the psychic struggle for this alterity. In the present era of gender and sexual fluidity, celibacy has become a complex phenomenon.

Celtic Religions

David Waldron

Department of Social Science and the Humanities,
University of Ballarat, Ballarat, VIC, Australia

Pre-Christian Celtic religion, mythology, and symbolism have left an incredibly rich and varied legacy in European culture. That being said, it is a field of folkloric mythological studies that is extremely diverse, varied, and, to some extent, historically quite problematic. The extent to which perceptions of Celtic culture and religious practices have been shaped by contemporaneous sociopolitical factors and the ubiquitous problems raised by Christian and Roman transmission has made attempts to develop a holistic understanding of the religious beliefs of the pre-Christian Celts

an inordinately difficult and complex affair. However, despite the very murky waters surrounding the historical record of Celtic polytheistic religion, there are very powerful archetypal themes and cultural forms that resonate through to the present.

Unlike the Paleolithic peoples before them, the Iron-Age Celts were semi-historic in that they left traces of their culture in written records and in the enormous wealth of archaeological finds (Hutton 1993). In particular, there are minted coins from Gaul, Raetia, Noricum, and the British Isles; sculptures and other cultural artifacts; Roman eyewitness accounts; and an array of literature and bardic lore transcribed in the Middle Ages. However, these sources leave a great deal to interpretation. The materials left in artwork and archaeological finds suggest a great deal regarding Celtic religious practice and leave many tantalizing themes for speculation on the nature of Celtic culture and religion. However, what remains is also quite fragmentary and open to fanciful fabrications based in more contemporary themes. The classical eyewitness reports, especially that of Caesar and Poseidonius, attempt to directly translate Celtic gods and rituals into Roman equivalents and the medieval accounts of Celtic folklore, such as that of the *Mabinogion*, strongly reflect medieval Christian and Saxon/Norman preoccupations, power structures, and social mores (Darvill 1987).

The Roman Conquest and the Celts

When examining the religious practices of Celtic polytheism, there are three distinct phases in the transmission of Celtic religion, folklore, and mythology. Firstly, there are the religious practices, artwork, and festivals of pre-Roman conquest Celtic civilization. Secondly, there is the synthesis and syncretism of the Roman colonization of Britain and Gaul. Finally, there is the further synthesis and development during the Christian period. In this context, however, and given the diversity and localization of many of the religious practices and rituals recorded, it is a problematic exercise to attempt to find a pure or unadulterated form of Celtic religious belief.

Rather, it is a living cultural tradition engaged in constant evolution and development in relation to sociopolitical issues, cultural transmission, and eclectic engagement with other societies and religious beliefs, forming a synthesis of mythological, religious, and cultural forms held together by common archetypal themes and symbols of powerful aesthetic and psychological resonance (Matthews 1991).

Celtic Culture, Religion, and Folklore in the Roman Era

While there is an enormous amount of diversity between Celtic regional and tribal affiliations, there are several key hierarchical, ritual, and festival themes that remain central to the religious practices of the Celts of antiquity. Caesar and Poseidonius both refer to Celtic religious practices being dominated by a triumvirate of religious castes – the druids who acted as priests and judges, the ovates who acted as seers and prophets, and the bards who specialized in versecraft, lineage, and lore keeping (described as *filid* in Ireland). This pattern of three religious castes was also chronicled by the later Christian scholars of the Middle Ages. Indeed, the number three seems to have been of enormous significance to the Celts appearing in numerous pieces of artwork, in the triple aspect manifestations of many of the deities, and in much of bardic lore transcribed by medieval Christian scholars (Darvill 1987).

Similarly, while there were immense variations between districts and language groups with regard to seasonal festivals and their ritual/festive activities, it is fairly certain that the four quarterly seasonal festivals associated with the solstice and equinox were practiced through Celtic society. Of these, Samhain, commemorating the end of the year and communing with the spirit world, and Beltane, celebrating the beginning of summer and the harvest, were the most significant. However, recent research by Ronald Hutton suggests that the centrality of Samhain and Beltane to Celtic religious practice may be far less than is generally accepted (Hutton 1993).

Attempting to understand the nature of Celtic deity is similarly difficult in that there was a complicated system of localized tutelary gods and, more commonly, mother goddesses, deities mixed with folkloric hero archetypes such as Lugh, and a collection of zoomorphic deity beings such as Epona the horse goddess and Cernunnos the hunter god which was appropriated as the divine male deity figure by contemporary Wiccans. This network of polytheism varied immensely between districts and language groups and is extremely difficult for the contemporary historian to study in earnest due to the aforementioned problems raised by Roman and Christocentric transmission. The result is that we are left with a bewildering and fragmentary array of evocative and powerful images, rituals, symbols, and archetypes open to much speculation and interpretation (Hutton 1993).

The Problems of Roman Transmission

During the post-Roman conquest period, this problem was further exacerbated by the well-documented tendency of Caesar, Poseidonius, and other Roman chroniclers to assume that the Celtic deities were direct equivalents of Roman and Greek deities without attempting to contextualize them within the established Celtic cosmology and social system. Furthermore, during the period of Roman colonization, many of the deities and ritual practices that did merge together with Roman equivalents and cults to Mercury (associated with Lugh in Celtic folklore), Mars (associated with Toutatis), and Jupiter (Taranic), among others, became increasingly common and widespread through Gaul and the British Isles. This merging of Celtic and Roman mythology, religious beliefs, and deities problematizes anthropological and historical interpretation through the loss of the original cultural meanings ascribed to the historical archetypal images of Celtic deity. At the same time, however, this synthesis enriches the analytical psychological perspective through the analysis of what the underlying mythic figures and deities in Celtic religious beliefs archetypically represent in the

collective unconscious. A similar pattern occurs when studying the influence of Christian chroniclers who were similarly preoccupied with an alternate cosmology and religious world view. They also found the symbolism, mythology, and archetypal resonance of the Celtic polytheistic mythos deeply inspiring, albeit in a medieval Christian context. Indeed, artwork and mythology inspired by Celtic mythology and deities deeply permeate the nominally Christian artwork and literature of medieval Western Europe. Perhaps the most notable example being the merging of Celtic mythic figures and deities with Catholic saints, in particular St Patrick and St Brigid (Hutton 1993).

The Celtic Revival

Another important legacy of Celtic religious practices has emerged in the late nineteenth- and twentieth-century pagan revival movements. Of particular relevance are the druidical pagan revivals spawned by folklorist and poet Iolo Morgannwg and related organizations such as the “Order of Bards, Ovates and Druids” and the “British Druid Order” (Hutton 1993). Drawing on the Romantic literary tradition’s fixation on nationally oriented cultural authenticity and sacrality of the landscape, the impact on Welsh and English national identity and culture inspired by these movements is immense and speaks to the archetypal power and psychic resonance of the mythology and religious beliefs of Celtic civilization. Similarly, Celtic-inspired mythology also deeply permeates other pagan revivalist movements, most notably Wicca and Goddess or Dianic Paganism with a strong fixation on the role of feminine-associated Celtic deities such as the Morrigan and Brigid (Bonewits 2006). Thus, while developing an empirical historical understanding of Celtic religious practices can be a fragmentary and problematic exercise, in analytical psychological terms it is a powerful and pervasive model of archetypal symbolism in European culture and a rich source of symbolism in the collective unconscious.

Celtic Shamanism

M. J. Drake Spaeth

The Chicago School of Professional Psychology,
Chicago, IL, USA

Though coming into increasing popularity as a contemporary spiritual practice, Celtic shamanism has also generated quite a bit of controversy over the past two decades. The term “shamanism” is not a religion as much as it seems to be a term that refers to ancient techniques for altering consciousness to accomplish spiritual purposes (Eliade 2004) nor is it in itself Celtic. There is no substantive historical evidence that individuals recognizable as shamans existed among Celtic tribes or Druid groups (Matthews and Matthews 2002). Nevertheless, several folklorists and historians have noted intriguing similarities between elements of Celtic mythology, tradition, fairy tales, and art and practices traditionally identified as shamanic (e.g., Cowan 1993, 2002; Matthews and Matthews 1994; MacEowen 2002). These Celtic elements do, in fact, closely resemble what anthropologist Michael Harner (1990) has identified as common or nearly universal elements of indigenous shamanism. He has labeled these

elements core “shamanism,” and they are typically experienced in what he has identified as the “shamanic state of consciousness” or “SSC” (Harner 1990). These similarities have inspired a contemporary system of spiritual practices for healing, alteration of consciousness, and self-development that proponents have termed “Celtic shamanism.” Celtic shamanism has been particularly popular among those of European and Celtic descent who are demonstrably hungry for a sense of spiritual connection with their ancestors.

Harner’s identification of common elements of shamanic experience around the world has led some to identify the shaman as an archetype – one of the universal thematic patterns of experience found in what Jung calls the collective unconscious (e.g., Cowan 1993; Smith 1997). Cowan (1993) identifies several elements as shared by both Celtic mythology and the shamanic archetype. To paraphrase Cowan, they are (1) the ability to sojourn in the “Otherworlds,” (2) the assistance of animal guides or powers in order to acquire or retrieve wisdom or power, (3) an initiatory experience (usually a literal or symbolic death and rebirth) or other experiences of a calling to heal or quest for wisdom or power, (4) a transformational experience of interconnectedness of all things or a state of unity, and (5) abductions by Otherworldly entities in this case faeries – into the Otherworld proper (pp. 13–14). Matthews and Matthews (1994) additionally point out that contacts and communication with ancestors and otherworldly beings are frequent elements found in Celtic stories, as are omens found in appearances of animals and plants, as well as acts of nature (p. 2). These authors also argue that in these stories, druids, poets, and seers are frequently inspired by divine wisdom and are identifiable as shamans. Finally, themes of heroic retrievals of lost objects of power, such as are found in the Grail quest stories call to mind Ingerman’s (2006) work, in which she describes in detail a key task of the shaman – namely, that of soul retrieval. Ingerman shows that throughout history, indigenous shamans have worked to bring back lost parts of a person’s spirit or soul that are regarded as having fled in response to trauma or illness. The fact that the

Grail is frequently identified with the Sacred King himself (i.e., Arthur) supports a correspondence between Celtic and shamanic concepts.

This link between Celticism and shamanism may have important implications for psychotherapy and counseling – particularly when spiritual issues are a focus of consideration. Moodley and West (2005) point out that many forms of indigenous spirituality and healing practices (which often go back more than a 1,000 years) are resurfacing and are enjoying popular contemporary practice – often in concert with traditional psychotherapy and counseling. Many such individuals find that such practices compensate for what they see as shortcomings of conventional therapeutic approaches due to lack of sensitivity to their particular experience of diversity or even outright contempt for “folk healing.” Celtic shamanism may afford individuals of European ancestry a means of connecting with their own unique cultural heritage. Familiarity with Celtic shamanism in psychotherapeutic contexts may enhance the therapist’s competence in the area of spiritual diversity, thereby contributing to an overall understanding of issues and phenomena related to diversity.

Celtic Spirituality

M. J. Drake Spaeth
The Chicago School of Professional Psychology,
Chicago, IL, USA

Celtic spirituality is a contemporary term that encompasses practices, beliefs, attitudes, and values that are loosely based on themes and remnants of Ancient Celtic traditions that survive in fairy tales and Celtic mythology. It is difficult to ascribe to the Celtic tribes an ancient, coherent, and organized religious structure, though arguably Druidry in various permutations embodied religious elements. For this reason, the term “spirituality” is particularly useful when describing contemporary Celtic spiritual practices, as it is widely regarded as embodying less authoritative, organized, institutional, and dogmatic phenomena than is generally implied by the term “religion.” Many scholarly works, book, and websites are devoted to discussion of the distinction and relationship between religion and spirituality, a full consideration of which is beyond the scope of this article.

Contemporary Celtic spirituality routinely and syncretically blends Christian and Pagan elements of ideology and practice. For excellent examples of such syncretism, the reader is referred to O'Donohue (1998, 2000), Cowan (2003), and

MacEowen (2002, 2004). All of these works focus heavily on the idea of “longing” or “yearning” as a significant feature of the Celtic spirit – longing for connection, for deep meaning, for a sense of power and significance, and for a realization of one's place in the natural world. Drawing on such themes, deeply rooted as they are in mythology and practices that date back to pre-Christian Ireland, Wales, and Scotland primarily, practitioners of Celtic spirituality uniquely find a sense of balance and connection to others, to place, and to natural rhythms of life. Such a sense of connection arguably comes closer to a “universal” definition of spirituality than anything else.

Other Celtic themes utilized by practitioners of Celtic spirituality are shape-shifting (or identifying with animals, plants, stones, or other features of the natural world to experience a multiplicity of perspectives of the natural world); awakening to one's place and purpose in the world; fostering recognition of the body as sacred and as the gateway to higher spiritual consciousness, initiation through rites of passage (or spiritual death and rebirth experiences); making choices that are in alignment with a higher purpose and accepting responsibility for said choices; living in balance and harmony with the cycles of seasons and of the earth; communing with ancestors and with the immanent divine spirit in the land; and recognizing the divine spark within oneself.

It is not difficult to discern within these concepts a strong correspondence to humanistic-existential and transpersonal psychology. Humanistic-existential psychologists, such as Abraham Maslow, Rollo May, Victor Frankl, Carl Rogers, Fritz and Laura Perls, James Bugental, and Leslie Greenberg, all speak articulately about the psychological value of an active search for connection, meaning, and purpose in one's life. They also emphasize that psychological health is rooted in a sense of moving from a state of fragmentation and separation into a state of balance and wholeness and integration. They identify the value of living in congruence between one's inner perceptions and values and the

external reality of one's life. The existentialists, in particular, stress the necessity of "waking up" and actively resist a somnambulistic tendency to conform and surrender to the "herd mentality" – not to mention actively and responsibly making choices and exercising our inherent power and freedom. Transpersonal psychologists such as Ken Wilber, Stanislov and Christina Grof, Stanley Krippner, and Roger Walsh broaden and expand the definition of "human" to encompass a connection with the "higher" or divine aspects of ourselves and the world.

Celtic spirituality affords its practitioners a unique, culturally congruent means of seeking and finding meaning and purpose in their lives. A culturally competent psychotherapist or counselor would benefit from an understanding of these spiritual practices in order to help clients of Celtic and European background who are experiencing a sense of cultural disconnection that underlies more superficial problems, challenges, and difficulties.

Centering Prayer

Chad Thralls

Seton Hall University, South Orange, NJ, USA

Centering Prayer is a method of Christian contemplation based on the fourteenth-century mystical text *The Cloud of Unknowing*. *The Cloud* offers spiritual guidance to one who is ready to progress in the spiritual life from verbal to non-discursive prayer. Following the apophatic strand of Christian mysticism which holds that the divine is ultimately beyond human comprehension, *The Cloud* envisions God lying above the one who prays with a cloud of unknowing in between. The goal of the practice is to focus attention on God by directing "sharp darts of longing love" into the cloud. The text envisions a second cloud, a cloud of forgetting, lying between the one who prays and the world. The anonymous author insists that any ideas or thoughts that arise during prayer are distractions that pull attention away from God and must be avoided by placing them under this cloud of forgetting.

Method. Centering Prayer originated in the 1970s at St. Joseph's Abbey in Spencer, Massachusetts. Two Trappist monks, M. Basil Pennington and Thomas Keating, have popularized this method of prayer through publications and retreats. The method itself is quite simple. One begins by concentrating attention on God. This is done by choosing a word that focuses one's desire for God. The word is then repeated slowly. Repetition of the sacred word serves as an aid in focusing one's attention onto God. (In the course of prayer, one may find that the word is no longer needed and stop repeating it altogether.) As one attempts to quiet the mind and focus the attention, distractions will inevitably arise. Instead of heeding the thoughts and images that clamor for attention, simply return to the prayer word. This helps return focus onto God. Finally, after 20 min, end the prayer by repeating the Our Father.

Distractions. Centering Prayer acknowledges that distractions are unavoidable during contemplative prayer. In *Intimacy with God*, Thomas Keating addresses the mental noise that plagues attempts to pray using this method. Much of this noise is simply distracting material, including items from our to-do list, intellectual insights, and the temptation to reflect on how well the prayer is progressing. Keating asserts that other types of material that pop up (such as long forgotten memories, fantasies, or disturbing images) are symptomatic of deeper issues and claims that the practice of Centering Prayer can facilitate the healing of these emotional problems.

Healing. Keating explains how Centering Prayer contributes to healing by interpreting it as a cycle composed of four moments. The first moment of the cycle initiates the sacred word and establishes attentiveness to God. This ushers in the second moment, which brings a deep sense of rest and refreshment. During this moment, Keating envisions that God is present in an analogous way to that of a therapist. Such a supportive relationship creates an atmosphere in which painful memories can be shared. Because such an accepting space has been established, in the third moment, Keating claims the unconscious unloads images that represent emotional wounds into consciousness. During the course of the prayer, these images are registered as distractions. Finally, in the fourth moment, which Keating terms “evacuation,” the emotional baggage is released from the psyche. Then the cycle continues by returning to the sacred word.

Distractions and the Unconscious. Ann Ulanov envisions how healing can occur through prayer in a different fashion. Sigmund Freud refers to the psychic life of the unconscious as primary process thinking. This level of the psyche is a raw, rushing flow of being composed of wishes, images, instincts, emotions, urges, and drives. One characteristic of the contents of the unconscious is that they continually attempt to communicate their presence to consciousness. Utilizing these concepts, Ulanov refers to the distractions that plague attempts to pray as “primary speech.” She interprets them as unconscious material trying to get the attention of

consciousness. Ulanov does not agree that healing occurs by the simple unloading and evacuation of unconscious emotional baggage. Instead, she recommends deliberately directing attention to distractions as they emerge during prayer. For her, it is by being honest about all the parts inside of us, and using them as conversation starters in a dialogue with God, that psychological healing occurs when one prays.

Central American Religions

Patrice Natalie Delevante
Richmond, VA, USA

Introduction

Central America’s religious beliefs and practices inform individual and collective thinking

and behaviors, psychologists conclude. Central America is comprised of El Salvador, Belize, Guatemala, Honduras, Panama, Costa Rica, and Nicaragua. Some countries in Central America are termed “The Northern Triangle”: Guatemala, El Salvador, and Honduras. During colonialism, Central America was introduced to the religions of Europeans, including the Spanish. The Spanish brought with them Roman Catholic and Christian views and thereafter forced the inhabitants of these countries to surrender their religious traditions and practice and acknowledge these new religious ideologies. Such decision, along with the oppressive government and military regimes during colonialism caused natives living in Central America to lose their ties to their ancestry and religion, and as a result of such maltreatment, natives felt inferior and nihilistic. Researchers observe also that during European colonization, many Central American civilizations were destroyed and replaced by Christian and or Catholic regimes which forced individual and communities to rethink and revise their identity and behavior to that of the colonizers in order to survive. Consequently, women, men, and children of Central American descent were victims of these conflicts and experienced ongoing government and military oppression, threats of and actual bombings, too poor and unsafe living conditions. Such perils caused many victims to abandon their families and countries.

However, there were many individuals of Central America who stayed and sought to identify the effects colonialism and post-colonialism had on individual awareness of religious ideologies and their mental states. Some of these individuals were psychologists and they termed their efforts to unravel nihilism and the ways oppression influence religion and identity a kind of emancipation psychology. Such study identifies that culture not only influenced religious expression and mental thought but also left individual and community traumatized (later renamed post-traumatic stress). While psychology is defined by the study of thinking and behavior, religion is described as a belief system of ethics that attaches important public figures, rituals, and traditions to a deity. Religion and psychology are intertwined

when examining the peoples of Central America and can be reinterpreted as an emancipation “narrative” enabling answers to and transformation of Central American social identity and cultural memory.

Background

When Europeans arrived in the countries of Central America, beginning in 1509, they colonized the areas and consequently caused the Indians living there cultural genocide. The 1980s saw a rapid response to colonialism that resulted in revolutionary wars and movements. The Salvadoran government killed 75,000 civilians during the civil wars of the 1980s. During war, many men, women, and children hid their religious belief or renounced them in order to avoid persecution. Some scholars coin this threat of persecution of Central Americans as “state terrorism.” In El Salvador and Nicaragua postwar, religious priests known as Jesuits called for a new national consciousness.

Religion

Religious communities in Central America, with their evangelical meetings and leadership, sought a collective response against the dominated religious ideologies forced upon them from colonialization. In Guatemala, there were many priests who publicly opposed European Christianity, calling it the source of cultural loss and oppression. During war and postwar, many villages saw an increase in gang violence by youths interpreted as a rebellious response to colonialism and an attempt to secure protection and raise their socioeconomic status illegally. In reaction, churches began a gospel of “anti-gang sentiment” through holistic perspectives. They believed in the idea of escaping the now “national trauma” that plagued Central America. Religious priest began to participate in politics, as seen by Guatemala’s first Pentecostal Chief of State, General Jose Efraim Rios from 1982 to 1983.

During postwar, there were also the revitalizing of religion in Central America from the practice of Pneumatic Christianity. This religion acknowledged the “gifts” of the Holy Spirit, a religious being. Such religious fervor and participation resulted in the healing of the subjective mind, body, and soul from their national traumatic culture.

The rise in participation of religious theology in Central America helped to remove the dominating emotional and mental oppression by replacing such ills with sound doctrines biblically based and relevant to the amelioration of the soul. Religion held socioeconomic, political, and cultural importance for citizens who were both victims and perpetrators of war throughout the years in that such expression and practice relieved and recovered Central America from the trauma of the civil wars. Themes such as reconciliation rang loudly in Christian churches, for example. Postwar Guatemala utilized religion to rebuilding efforts at a communal level.

The absence of religious revival meant to most nihilism. Religion prescribes hope and healing for victims of war. Other religions that have influenced men, women, and children in Central America postwar were Evangelical Christianity and Neo-Evangelicalism. Mexico showed a high percentage of (Neo) Pentecostals while in Guatemala the numbers of Pentecostals increased in 1960–1985. French educator Allan Kardec (1804–1869) is considered the most influential religious leader, and he contributed to the development of religion in Central America. Kardecian Spiritism involves the idea of conversing with the supernatural world in which he states contain worlds and spirits that can involve themselves in helping the living. Spiritism, practiced throughout Central America, also became a source of emancipation from ongoing oppression. That Spiritism is the belief in reincarnation and the aftermath of the afterlife, and followers believe in the religion’s healing power; religion in Central America sought public and local expressions of “truths” about themselves and society in opposition to the dominant oppressing government.

Ernesto Cardinal was a poet and priest in Central America’s Nicaragua who intertwined religious

ideologies and its application to society and cultural politics of the peasant. The Cardinal announced a roundtable of members of the community of peasants to respond to local politics and reveal their insecurities surrounding culture and the oppressive government. Children from these practices performed “sociodramas” as a political and religious response to their society and church, hoping then to increase awareness and cultural appreciation.

Psychology

Psychologists beginning in nineteenth century were urged to cite behaviors and thinking that can reroute an individual’s identity. Gang members are often cited by psychologists as harboring an intricate identity that baffles both religious groups and psychologists. In Central America, many youths retreat to gangs to escape torture and unsafe conditions at home. Gangs offer members attention and safety and a route outside of poverty. They violate the laws and even in prison remain a constant threat. They are referred to as being “married to death” and initiating “transnational gangs.” However, there are former gang members that seek religion to overcome their turbulent lifestyle. That they are numbed to their emotions and wrongdoings and also afflicting violence towards others, psychologists suggest reveal that they suffer from psychosocial trauma. Their poor and violent conditions as youths caused negative and violent thinking and behavior. However, religion reversed the consequences internalized by these former gang members. Importantly too, psychotherapy has been suggested to highlight social identity as a place to begin when probing into individual past trauma.

In Central American countries, there have been priests and psychologists that have advocated to unveil the causes of violence, shame, and nihilism within these countries during war, postwar, and reconstruction. There was a priest who was assassinated, Ignacio Martin Baro (1942–1989), and as many argue, it was due to his cultural politics of emancipation psychology. He warned the church and psychologists to not forget the reasons

causing society's insecurities and gang rage – individuals' poor socioeconomic status. He especially argued that children experienced post-traumatic stress after having lived through war conflict. Baro, who was both a psychologist and Jesuit priest, advocated that the profession of psychology should adhere towards teaching emancipation psychology. Baro and his likes suggested that psychologists not only study behavior and thinking processes of men, women, and children but also find ways to alleviate such oppression of marginalized people, especially women and children. He observed their emotional dangers during wartime and sought ways to develop doctrines motivating individual and communities' spiritual lives too. Baro believed in psychology efforts "from the bottom up" – so to restructure perceptions of the victimized poor. He views trauma as a "collective," "disruptive," and an "oppressive" experience for victims of war. He proposes instead of a "psychological trauma" inflicted on society, especially children, and he seeks to unravel the reasons why society has been oppressive to children. As a result, he warns psychologists to examine the ways society distorts children's conceptualization of community and identity from its repressive regime. He prescribes children of war as plagued with post-traumatic disorder and recommends that psychologists complete ways to reinstate children's "trust" of themselves and their community, which should alleviate issues associated with society during war and postwar.

Baro also likened the results of war as a lesson in behavior and thinking of men, women, and children. He advocates for a "critical consciousness" or perspective examining war and postwar society. In post-Baro, psychologists also call for a new kind of "social psychology," with the intent to support societies' conception of identity and ideologies. Research suggests that psychology is classed and accessed only to the elites. Social psychology is crucial here to understanding the ways community informs individual behavior and thought processes. Community social psychology, which began in Latin America, also concerns itself and study towards transformation of the "oppressed minority" and the revising of

government procedures that can enhance community. Community social psychology delves into a kind of social response and thereafter is considered a type of social responsibility to react to post-traumatic stress on the individual and community.

Additionally, psychologists inform that a psychosocial trauma should be examined from the perspective of an individuals' mental health condition caused by traumatic experiences such as war. Psychologists are urged to follow and proceed with caution when examining psychosocial trauma. Such victims' identity in this scenario requires inquiry, resolutions, and inclusion. Psychologists argue too that society should see themselves as projections of a community knowledge and identity. These same psychologists examine the reasons why government have "closed communication" to their citizens, causing nihilism in victims of war. Central American countries distorted social identities for the people and overtime caused destructive thinking and behavior.

Some psychologists provide a study of the effects of oppression and government repression on the individual and the community, arguing that both determinants level and distort identity. Psychologists also concern themselves with transformational politics, or ways to renew the individual and community from oppression and practices deemed distorting civil society and rights of its citizens.

Conclusion

Religious leaders and psychologists are warned about psychosocial trauma rampant in victims of war in Central America and are urged to develop religious doctrines and practices, and psychotherapy to lessen the severity in victims. Researches observe that treatment options for victims and perpetrators of war should include therapy to relieve themselves from a poor and traumatized social identity. There is the call for psychologists to unearth the root cause of war (i.e., "failed economic order") so to understand collective and individual consciousness and the way it fluctuates during war and postwar. Though there are peace

treaties being signed in Central American countries, many women, men, and children experience insecurities about prospects of a new identity that is not constructed or a result of government sanctions. These religious commissions provide relief both individually and as a community to loosen the national trauma and memory of past destructive wars. Places and events might trigger mental illness so it is the responsibility of the government, churches, and psychologists to return their countries into reconstruction and a new national consciousness. Globalization could reverse the countries' loss of cultural religion and cultural internal tensions by exchanges of religious and psychological thinking about identity. The Psychologists of the Committee for Health Rights in Central America and religious churches in Central America, for example, could join together to bring local political roundtable discussion on identity issues plaguing men, women, and children postwar and how psychology informs their truth.

Chakras

Trish O'Sullivan

Kwan Um School of Zen, Psychotherapy,
New York, NY, USA

The term chakra (Sanskrit *cakra* but pronounced *chakra* and in general printed usage in the West) comes from the Hindu/Yoga tradition and is a Sanskrit term meaning wheel or mystical circle. The term refers to psychoenergetic centers in the subtle or nonphysical human body (*lingadeha*) discovered in ancient India. The chakras are believed to move in a circular manner and funnel universal energy into the human energy system. References are made in the ancient (ca. seventh century BCE) Upanishads to an esoteric human anatomy composed of subtle life energy or *prana*. This anatomy is comprised of 72,000 *nadis* or channels along which subtle energy travels. Although the chakras or energy centers are not specifically mentioned in the *Upanishads*, the *Maitri Upanishad* (6.21) mentions the *Sushumna* channel which is central to the *Kundalini Yoga* philosophy and practice as are the chakras. The Upanishads also describe five elements – earth, water, fire, air, and ether associated with this subtle body.

Investigation of this subtle body by later Yogic and Tantric practitioners led to a more thorough description including the three vertical channels – *Sushumna*, *Ida*, and *Pingala* – aligned with the spinal axis. It is in the Tantras composed in the medieval period that the term chakra was first applied in written form to these focal points or centers. The *Sat-Cakra-Nirupana* (ca. 1577)

Chakras, Table 1 Seven major chakras

Chakra	Sanskrit translation	Location	Associated element
Sahasrara	Thousand-petaled	Crown of head	
Ajna	Command	Third eye	
Vishuddha	Pure	Throat	Ether
Anahata	Unstruck	Center of chest	Air
Manipura	Gem site	Solar plexus	Fire
Svadhithana	Own abode	Below navel	Water
Muladhara	Root support	Base of spine	Earth

describes each of the seven chakras in detail. It was the translation of this text by Sir John Woodroffe (penname Arthur Avalon) entitled *The Serpent Power* published in 1919 that brought specific knowledge of the chakras and Kundalini to the West.

The five elements are associated with the first five chakras. The higher chakras are associated with spiritual knowledge beyond the physical realm. Knowledge of this subtle anatomy and the association with these elements spread from India to Tibet, China, and Japan where distinct practices developed. For example, Chinese acupuncture is based on the flow of subtle energy or chi through the nadis or meridians and the balance of elements in the body.

Tantrism and Yoga typically distinguish seven chakras aligned along the spinal axis. A reserve of spiritual energy or Kundalini is believed to abide in the *Muladhara* chakra located at the base of the spine. Meditation, breathing, and mantra practices arouse this dormant energy and encourage it to rise up the spine through the *Sushumna* channel. During this process the other six chakras are encountered and energized. Depending on their energetic state, they can either block or facilitate this upward flow of spiritual energy. Kundalini Yoga especially focuses on this subtle body and the raising of the Kundalini from the base chakra to the *Sahasrara* chakra at the crown of the head with the intention of attaining spiritual realization. However, all forms of Yoga have the intention of awakening and raising the Kundalini in order to stimulate moral and spiritual growth.

Just as the associated elements progress from gross (earth) to fine (ether), the energies associated with each chakra are believed to be more

gross or lower vibration in the lower chakras and finer, or higher, vibration in the higher chakras. The spiritual journey is, thus, a developmental one with sequential steps or levels on the path to transformation of consciousness.

Each chakra is believed to control specific physical, spiritual, emotional, and psychological functions and elaborate mandalas came to be associated with each. These mandalas include Sanskrit letters, colors, god or goddess with associated symbols, geometric shapes, an element, seed sound or mantra, animal, and specific number of lotus flower petals (the chakras are sometimes referred to as *padmes* or lotuses) indicating the rate of vibration of the energy associated with the particular chakra.

There is variability related to the number and placement of the chakras, e.g., *Sahasrara* is sometimes placed above the crown of the head. In Buddhist Yoga there are five such centers, and in Hindu Yoga six or more chakras. Following is a table of the major chakras depicted in Hindu Yoga and located along the central *Sushumna* channel (Table 1).

Reference is also sometimes made to minor chakras located at various parts of the body.

While knowledge of the chakras has come to the West primarily from the Indian Tantric tradition, other religions such as the Jewish Kabbalists, Sufis, and Taoists also describe energy systems and centers.

Psychology and the Chakras

Meditations and asanas have been developed by Yoga masters to heal both body and mind, and

there are specific practices developed to open the chakras and alleviate anxiety and depression as well as medical illnesses.

The emergence of Western depth psychologies coincided with the translation and dissemination of Yogic texts in the West. However, the Western distinction between philosophy and psychology, its emphasis on empirical methodology and ignorance of subtle energy mechanics, has prevented the acceptance of the chakras as a subject of serious consideration and research in the West.

Jung was very interested in the chakras and viewed them as symbolically depicting inner experience and psychological stages of development. He thought of the Kundalini process as a metaphorical journey such as climbing a sacred mountain. A series of lectures he gave on this topic with J. W. Heur in 1932 reveals his deep interest and intensive study of available material, particularly Sir. John Woodroffe's *The Serpent Power*. Jung saw Kundalini Yoga as a process of individuation and translated Kundalini Yoga terms into those of analytical psychology. Jung viewed the system as strictly metaphorical and eastern spiritual realization as a projection of unconscious contents. At the same time, Jung also talked about Kundalini as if it were a real phenomenon and warned that transitions from one chakra to another can lead to psychological crises. He cautioned Westerners away from experimentation with the chakras and Kundalini.

There is a phenomenon known as "meditation sickness" in the East, wherein headaches, chest pain, or stomachaches may occur when the beginner practices excessively. This is believed to result from chi (Kundalini energy) rising too fast. The antidote is to leave off meditation practice until it goes away. This may take weeks or months.

This ladder-like hierarchical model of the chakras corresponds at places to Maslow's Hierarchy of Needs with physical safety and security associated with the first chakra (Muladhara) and autonomy with the seventh (Sahasrara).

During the past few decades, many books have been published about the chakras in the West particularly by New Age authors, yet few psychotherapies have developed utilizing this subtle energy system. However, Western clinicians

with experience with Eastern spiritual practices are beginning to develop psychotherapies incorporating this focus. OME (Organic Mind Energy) psychotherapy and Seemorg Matrix Work are two such psychotherapies.

Reichian, Bioenergetics, and Rolfing are related body therapies that work to release constricted vital energies in the body.

Chan Buddhism

Wing-shing Chan

Faculty of Medicine, The Chinese University of Hong Kong Special Administrative Region of the People's Republic of China, Shatin, NT, Hong Kong

Chan Buddhism is a major Chinese Buddhist sect attributed to Bodhidharma that emphasizes attaining Buddhahood, the supreme Buddhist religious goal, through enlightenment of one's own mind, which subsequently spread to Japan and named as Zen. In Chan Buddhism, the word "Chan" comes from "Dhyana" in Sanskrit (Soothill and Hodous 1937), which refers to meditation, samadhi (one-pointed concentration or perfect absorption), but nevertheless goes beyond the meaning of dhyana to become the manifestation of wisdom with simultaneous perfect composure of the mind (Huineng 1969).

With its focus on personal enlightenment of the mind in the present life, Chan Buddhism is characterized from the other Buddhist sects by its disrespect for religious rituals, sacred texts, godly figures, or intellectual understanding but instead emphasizes on meditation, intuition, master-student relationship, and practicing and realizing within the mundane here-and-now life.

Development of the Enlightenment Sect

Our Buddha-nature, the mind of enlightenment, is considered to be ever present, just awaiting for discovery through meditation, practice, or direct intuitive insight. Lineage transmission between

enlightened minds is stressed with Bodhidharma, transmitting the right enlightened mind from Buddha to the Chinese patriarch Huike, Sengcan, Daoxin, and Hongren and to the sixth patriarch Huineng, considered the source for the subsequent flourishing of the five Chan sects, including the dominant and still surviving Linji (Jap: Rinzai) and Caodong (Jap: Soto) sects.

The Six Patriarch's Platform Sutra, likely to be written by the disciple Shenhui (Hu 1953), established Huineng (638–713) as beginning a Chan era of sudden enlightenment, for which the Chan sect is externally received and recognized.

Sudden enlightenment refers to the sudden or quick glimpse of self-nature, Buddha-nature, or emptiness, without necessarily going through extended years of meditation or practice. Chan masters were recorded to be able to set off an enlightenment experience in their students through twisting a student's (Baizhang) nose to pain, skillful verbal remarks (Master Mazu) enlightening instantly a novice hunter, or banging a door on the student's (Yunmen) leg. Analytically, there are probably two relevant causes that make these sudden enlightenment experience possible:

1. A significant piece of psychological (or spiritual) attachment is suddenly forced to detach and an enlightening experience is resulted (Chan 2008).
2. The discursive mind is suddenly forced to halt or bypassed whereby the nondiscursive enlightening mind is revealed.

The gradual enlightenment path refers to a more gradual or relatively continual revelation of enlightenment in parts attained normally through extended years of meditation or practice.

Essentially the practice of Chan Buddhism had mainstreamed into two sects, namely, the Linji sect that emphasizes the sudden enlightenment path with instructional methods including shouting and hitting and the Caodong sect, predominantly a gradual enlightenment path that relies heavily on meditation practice.

The sudden enlightenment era of Chan in the Tang Dynasty gradually went to its historical downturn, and by the Song Dynasty, the myriad

masterful ways of initiating sudden enlightenment had gradually receded and the Chan sect began a more safeguard way of practice with more fixed form for enlightenment.

The Linji sect, attributed to Dahui (1089–1163), adopted the “Huatou” or “Gongan” method of practice. By huatou or gongan method, a practitioner is instructed to generate real “doubts” by paying attention to a phrasal excerpt of a gongan, the recorded open case of enlightenment experience, or the whole gongan itself, such as the phrase “What is Wu (nothing or emptiness)?” or the gongan whereby Master Zhaozhou said “Dog has no Buddha nature!” Vigorous immersion into the query might eventually lead to the disbursal of the “doubt mass” with a shattering of the illusive mind so that one can suddenly “see” the Buddha-nature.

The Caodong sect, through Master Hongzhi Zhengjue (1091–1157), had come up with a method of practice called “silent illumination,” by which a practitioner practices a kind of formless (no fixed concentration focus) meditation (Chan 2004) whereby nondiscursive silence is coupled simultaneously with illuminative contemplation so that a nonmoving mind with clarity and wisdom is gradually attained, which is itself enlightenment. This method was subsequently transmitted to Dogen who established the Soto Zen in Japan with a similar practice called Shikantaza (just sitting).

In final analysis, there are no definite advantages of sudden enlightenment over gradual enlightenment, for sudden enlightenment can be quick but not thorough while gradual enlightenment can be slow but firm. Ultimately, it is the degree of vexation dissolution and attachments disintegration (Chan 2006b) that count toward attainment of no-self and genuine complete enlightenment.

Since the Ming Dynasty, Chan sect further declined in China as the Amitabha sect of recitation of Buddha’s name became more popular and prevalent. Many Chinese Buddhists combined the methods of Chan with recitation of Buddhas’ names. A common huatou within the Chan sect had become to investigate “Who recites the Buddha name?” transforming the Buddha name recitation into a huatou method that can lead to enlightenment.

The Chan sect today has witnessed some revival led by efforts of Master Sheng Yen (1930–2009), who had led numerous international Chan retreats on both huatou and silent illumination methods and espousing a three stage Chan theory (Sheng-Yen 1979) of (1) Small self, the discursive self of the ordinary people and beginning practitioners; (2) Big self, the unified self of the concentrated mind and harmonized body; and (3) No self, the mind who has seen Buddha-nature or attained enlightenment.

Distinctive Expressions of Chan Buddhism

Chan Buddhism is also renowned and distinguished from other Buddhist sect by its disrespect for literal medium and rational thinking, a strange exhibition of uncommon behaviors in the gongans, and sometimes a display of highly abstract symbolism in language and art. The underlying thread linking all the above Chan characteristics is actually a need to bypass the ordinary defiled and discursive cognitive thinking mind such that the pure and nondiscursive mind of enlightenment may have a chance to reveal.

Unlike other Buddhist sect, there is also a de-emphasis on precepts or practice. Absolute freedom and spontaneous rightful action appropriate to the circumstances are believed to be attained through enlightenment such that prima facie adherence to strict moral rules becomes both unnecessary and a hindrance. Famous gongans are Guizong’s ploughing dead a snake in a field work and Nanquan’s chopping a cat among disputes among monks.

The ultimate Chan practice is believed to be both effortless (no concentration effort) and methodless (everyday life as practice) (Chan 2004) and that explains why Chan masters instruct students practice only by eating or excreting, wearing ropes, or daily works with no meditation needed, e.g., Linji sleeping at the Chan meditation hall after enlightenment. The Chan sect is also well known by its disrespect for religious symbols, such as Buddha, patriarch, or sutras. This is in accordance with the need to attain absolute non-

dwelling emptiness (Madhyamika, the middle way) for which any attachment to “sacred” symbols, even Buddha or Buddhism itself, could stand as the last hindrances to complete enlightenment.

Lineage transmission between master and students is considered essential in Chan Buddhism for it is the self-experience of realizing Buddhahood and liberating enlightenment that is important, not the understanding of religious facts, principles, or the acting out of religious behavioral guidelines. Typical attainment verification guidelines include, e.g., the “*Ten Ox Herding Pictures*” (Sheng-Yen 1988), which depicts the progressive stages a practitioner would go through, by the analogy of taming the mind like taming the ox; and Master Dongshan’s (Five positions of king and minister), a list of five successive Chan attainment stages through the transposition of the manifestation between wisdom and vexations (Chan 2006a).

Chaos

Fredrica R. Halligan

Mind Body Spirit Institute, Stamford, CT, USA

In archetypal creation myths, the origins of the cosmos are believed to be a state or condition called chaos. Even Western science with its “Big Bang” theory can be construed as being an origin in chaos. In ancient wisdom we find many creation stories that began with chaos. In the Judaic tradition, for example, God’s voice called out over the deep and thus did creation emerge from chaos and darkness. In similar fashion, in the Vedic tradition, when the Absolute spoke the primal word “*Om*,” the wonders of the created universe emerged from chaos, each element pervaded by the Divine. Thus, ancient visionaries seemed to recognize the intimate connection between chaos and creativity, and this is an interrelationship that many scientists have been actively exploring today. As Briggs and Peat state:

Although we humans tend to abhor chaos and avoid it whenever possible, nature uses chaos in remarkable ways to create new entities, shape events, and hold the Universe together. . . . Just what is chaos? The answer has many facets. . . . To begin with, chaos turns out to be far subtler than the common sense idea that it is the messiness of mere chance. . . . The scientific term ‘chaos’ refers to an underlying interconnectedness that exists in apparently random events. Chaos science focuses on hidden patterns, nuance, the ‘sensitivity’ of things, and the ‘rules’ for how the unpredictable leads to the new (1999, pp. 1–2).

Chaos is ubiquitous. From weather patterns to the behavior of homing pigeons, from raging rivers to the nerves and blood vessels in the human body, and from craggy coastlines to the intricacies of fern leaves, nature is filled with complexity, and

scientists are discovering common, archetypal patterns that underlie seemingly chaotic systems (Conforti 2003). Moreover, science is discovering that there is an enduring interrelationship between chaos and order. Like waves in the ocean, all the energetic patterns of life arise and fall, wax and wane. Chaos organizes itself into order, and order inevitably dissolves into chaos. The sequence – chaos to order to chaos to order – repeats itself in the ever-changing patterns of life.

Chaos Theory as a New Paradigm

Today's chaos scientists have rejected the compartmentalization of the sciences, where part systems have long been studied in isolation from the whole – a compartmentalization that often leads to reductionism and oversimplification. Rather, the new inter-scientific paradigm crosses the fields of physics, mathematics, biology, astronomy, meteorology, psychology, physiology, and more. James Gleick was among the first to recognize and articulate the interrelationships of chaos patterns across the varied scientific fields. He wrote "Patterns born amid formlessness: This is biology's basic beauty and its basic mystery. Life sucks order from a sea of disorder" (Gleick 1987, p. 299).

Among the many component parts of chaos theory, perhaps the most widely known is termed "the butterfly effect," after Edward Lorenz's discovery in 1960 that tiny changes in initial conditions can have major impact on resulting weather patterns far away. This occurrence has been likened to the mathematical properties of feedback loops and iterative processes, both of which are common in many areas of nature. In his 1972 paper, "Predictability: Does the Flap of a Butterfly's Wing in Brazil Set Off a Tornado in Texas?," Lorenz (1993, pp. 181–184) sets about correcting misconceptions due to his use of the ancient Chinese proverb about the far-reaching effects of small variability such as a butterfly's wings flapping. But the fact remains that feedback loops and nonlinear mathematical systems often

appear to create chaos when, in reality, they are behaving precise laws that are often so subtle as to be undetectable. The very unpredictability of weather systems, for example, makes the current debate about global warming most intense. One must remember, however, that feedback loops often reach a point of no return where one pattern is irrevocably shifted into another entirely different pattern. The butterfly effect lies behind many currently unknown subtle effects and unanswered questions. In climatology, for example, how much change in average temperature will cause sufficient ice melting to irrevocably raise sea level so as to wipe away shorelines and inundate coastal cities worldwide? Or the butterfly effect from the perspective of individual clinical health psychology: how much does a tiny taste of sugar affect a dieter's resolve? How much does a whiff of alcohol disturb the precarious balance of an alcoholic's life? Or in the complexity of a family system, how much can a single eyebrow raised in criticism trigger the eruption of chaos that may affect the entire system with repetitive, dysfunctional patterns?

Repeating Patterns

Another element of chaos theory that is well known is the mathematics of "fractals." First introduced and named by Benoit Mandelbrot at IBM, fractals are complex forms that possess self-similarity at many different levels or scales – whether seen in a microscope or viewed from a great distance. Intricate patterns repeat in the many branches of a fern, for example, or in the folds and crevices of the human brain. In psychotherapy, similar patterns are seen over time when one studies the dynamics of an extended family system. This "multigenerational transmission process" described by Murray Bowen can also be conceptualized as a fractal viewed over time.

Just as chaos and order are interrelated, so too are such apparent opposites as competition and cooperation. They are complexly interwoven.

A complex chaotic system... contains a constantly unfolding dynamic in which what we call competition may suddenly become cooperation and vice versa. In chaotic systems, interconnections flow among individual elements on many different scales (Briggs and Peat 1999, p. 63).

Furthermore, patterns repeat. Because it is thought that the system is “attracted” to a particular pattern of behavior, that pattern is called a “strange attractor.” Clinically, one needs only to recall Freud’s description of the “repetition compulsion” to know that these strange attractors are found in psychology as well as in the other sciences.

The spiritual dimension of chaos theory is found in the profound glimpses that this theory gives into the basic mechanisms that underlie all of life. In studying the interweaving complexities of chaos theory as it applies to all of the sciences, the sacred dimension of mystery is heightened, and a sense of awe is engendered. We humans, with our own complex patterns of intrapsychic and interpersonal group life, in many ways echo the complex patterns – the archetypes – that are being discovered increasingly in the entire creative/chaotic environment in which we are embedded.

Chaplaincy

Teresa E. Snorton

Fifth Episcopal District, Christian Methodist Episcopal Church, Birmingham, AL, USA

The concept of “chaplain” has a long history, originally associated with the priest who performed religious rites and rituals in the military. The role of chaplain expanded to mean any minister who performed such religious care in public and private institutions, including the military, hospitals, schools, and prisons. The term became more closely associated with Christian faith traditions but in recent years has been embraced by a wide variety of religious traditions.

Chaplaincy is the broad term used to describe the work of and ministry provided by chaplains. In recent years, as the profession has recognized diversity, particularly religious pluralism, terms such as “chaplaincy care” and “spiritual care” have been added to the more traditional concept of “pastoral care” to describe the work of a chaplain.

While original chaplains were ordained priests and ministers, laypersons may also be commissioned by their faith group to function as a chaplain. In addition, the ministry provided by chaplains has expanded beyond religious rites and sacramental rituals to include crisis ministry, counseling, ethical decision-making, education, staff support, worship, and the coordination of community and congregational services and relationships to the institution (Smith 1990, p. 136).

In North America, chaplains have their strongest history in the military and in hospitals. The first military chaplains were priests and ministers who traveled with the military units into battle, praying for victory and administering prayers and Last Rites to the wounded and the dying. In the mid-1920s, the first known formal training for those providing pastoral care in secular institutions occurred through the inspiration of Dr. Dick Cabots in the general hospital setting

and then in the early 1930s under the leadership of Rev. Anton Boisen in the mental hospital setting. This clinical training became known as Clinical Pastoral Education (CPE) which continues to exist as the primary education and training for those preparing for ministry in specialized settings. In the 1940s, the movement to create standards for the professional certification of chaplains was initiated.

Today, the professionally trained, certified chaplain is the norm for most institutions and agencies that employ or utilize chaplains. Clinical Pastoral Education (CPE) is offered by a number of organizations, including the Association for Clinical Pastoral Education (ACPE), the College of Pastoral Supervision and Psychotherapy (CPSP), and the Canadian Association for Spiritual Care/Association Canadienne des Soins Spirituels (CASC/ACSS) in North America. CPE is also offered by various organizations and institutions in Europe, Asia, Australia, and Africa. Once trained, chaplains are certified by a number of organizations, including the Association for Professional Chaplains (APC), the National Association of Catholic Chaplains (NACC), the National Association of Jewish Chaplains (NAJC), and the College of Pastoral Supervision and Psychotherapy (CPSP). A number of other organizations and faith groups also train, certify, and/or commission chaplains. Many of them are members of the COMISS network in North America, a network of institutions, agencies, and faith groups that endorse, employ, support, or train chaplains or accredit chaplaincy training programs. COMISS operates under the umbrella of the concept of ministry in specialized settings.

While the criteria to become a professional, certified chaplain varies from organization to organization, a standard set of basic requirements have emerged, including ecclesiastical endorsement from one's faith group, ordination or commissioning by one's faith group, a predetermined level of theological education of degree, and clinical training and education (usually CPE) (Smith 1990, p. 136). Most certifying organizations also require some time of demonstration of competence through written papers and other documentation, as well as a face-to-face

interview with the Certification Commission or Committee of the certifying body.

The chaplain in the millennium era is confronted with a variety of crises situations for which one must be well trained. While a majority of chaplains spend their workday in the institution or facility providing routine care; listening and counseling the clients, constituents, and staff; organizing and conducting religious worship services; and providing sacramental rituals such as baptism, communion (also known as the Lord's supper or the Eucharist depending on one's faith tradition), and the Sacrament of the Sick (formerly known as "Last Rites"), the role of chaplain has expanded to include a variety of services of functions reflective of a diverse and complex world.

In many institutions, the chaplain works closely with institutional leadership to make sure the religious and general services provided by the institution are culturally sensitive and reflective of the diversity of the community and clients that the institution serves. Chaplains are also included on institutional Ethics Committees, advising on the complex biomedical ethical issues that emerge in today's technology-driven world of care and serving as a direct consultant to patients, families, clients, and staff as ethical decisions are considered and made.

Chaplains are also active participants in the end-of-life care protocols and bereavement programs at many institutions. They assist interdisciplinary care teams, patients, and families in making decisions around care at the end of life and often manage the institution's care to families at the time of death. Chaplains are trained to deal with the intense and often painful realities that accompany tragic and accidental deaths, prenatal and neonatal deaths, suicides, long-term illness and hospice care, war fatalities, and the deaths of prisoners. Chaplains often advise on issues of living wills and durable power of attorney for healthcare, formal processes for individuals to establish the life-saving measures they do or do not desire to have should they become unable to make those decisions or the person(s) who they designate to make such decisions.

Research on the impact of chaplains and pastoral/spiritual care has increased to demonstrate

and determine the ways in which these professionals and ministries affect such things as hospital length of stays, pain management, recovery periods, rehospitalizations, and recidivism. The abstract of an article entitled “Chaplaincy Research: Its Value, Its Quality and Its Future” sets the stage for current research in the field. The article is divided into four major sections, the first of which presents and discusses various reasons given by major researchers in the field why chaplains should do research. The second section summarizes findings on the sophistication of research on religion and health published in (a) medical and other healthcare journals and (b) specialty journals on religion and health, chaplaincy, and pastoral care and counseling. The third section revisits suggestions that have been made by prominent chaplain researchers to increase and improve research by chaplains. The last section offers some suggestions for expanding several lines of current research in the future, including research: (1) to elucidate the nature of spiritual care chaplains provide to different populations, including patients, families, and staff; (2) to assess the prevalence and intensity of patients’ spiritual needs and the degree to which they are being met; (3) to identify that subset of patients who are spiritually at risk in terms of having high needs and slow religious resources; (4) to identify the biological causal mechanisms by which religion influences health; and (5) to measure the effectiveness of chaplain interventions (Weaver et al. 2008).

Specialty professional journals in the field have emerged since the 1940s to chronicle the work of the chaplain, describe the practical skills required for chaplains, and identify the common functions and ministry of chaplains, in addition to the research being done in the field. Some of these journals include the *Journal of Pastoral Care and Counseling* and the *Journal of Health Care Chaplaincy*. A number of professional medical journals have also published articles related to spirituality and medicine, faith and health, and other connections between the healthcare and religious worlds, with the mainstream recognition and acceptance of holistic care.

The most recent movement in chaplaincy is the creation of “standards of practice” for a variety of

subspecialties in chaplaincy. The Association of Professional Chaplains (APC), a multifaith organization that certifies chaplains in North America, has been the leader in defining these standards in the areas of acute care, long-term care, and hospice care. The APC plans to develop standards of practice in other subspecialty areas such as mental health, children’s health, and corrections. Modeled after standards of practice for physicians, nurses, and other healthcare professionals, the “Standards of Practice for Professional Chaplains” are intended to define and describe the minimal standards for chaplaincy care and the consistent, observable skills in which professional chaplains should be competent.

The “Standards of Practice for Professional Chaplains” built on two earlier collaborative works by several of the pastoral care/education/certification organizations to define professional chaplaincy in the healthcare setting (“Professional Chaplaincy: Its Role and Importance in Healthcare,” edited by Larry VandeCreek and Burton 2001) and to create common standards and a common code of ethics in the field (“The Common Standards and The Common Code of Ethics,” created by the Spiritual Care Collaborative 2004).

Chaplaincy has grown into a professional ministry with its own unique identity, as well as a diverse field in and of itself. Today, there are associations of police chaplains, race track chaplains, airport chaplains, correctional chaplains, workplace chaplains, and campus chaplains, in addition to those for the traditional hospital and healthcare chaplains. As the world recognizes the mind, body, and spirit connection as essential to the care of persons and embraces a respect for the diversity of faiths and religious traditions, the role of chaplain will be a critical and more essential one in public and private institutions.

Charisma in New Religious Movements

Benjamin Beit-Hallahmi
Department of Psychology, University of Haifa,
Haifa, Israel

Charisma is something that we may find hard to define or predict, but easier to recognize. It is an observed and inferred personality trait, usually diagnosed after the fact when discussing historical events, and often used as a causal explanation, e.g., “group X gained many followers because of the leader’s charisma.” If leadership is a status conferred by a leader’s followers, charisma is a type of leadership we infer from its exceptional effects.

Some researchers have suggested that charisma, an innate trait, is experienced through certain signals that the charismatic leader radiates in a particular communicative manner. It may be recognized as an awe-inspiring rhetorical style, which is emotional, positive, and excited, effective in inspiring and attracting followers and peers. Thus, the oratory skills of the Peoples Temple’s founder, Jim Jones, have often been recognized by observers.

New religious movements (NRMs) are, by definition, belief minorities and often find themselves under majority pressure. In religious movements, a leader is the embodiment of religious ideals; in many NRMs, he is the founder and the origin of these ideals. The challenges to leaders are extreme, as the group’s existence and survival are often in question. The charismatic and direct nature of leadership, in the absence of articulated structures involving multiple levels of hierarchy, create internal tensions. The idea that leaders are chosen through the power of revelation or religious creativity may legitimize schisms.

How can we account for of the high emotional involvement and total commitment in members? The transference hypothesis, derived from psychoanalysis, proposes that followers experience leaders subjectively as parent figures. A broader and more obvious suggestion is that the leader is a love object. An effective leader creates a mutually empowering relationship with his followers, at least for a while. Followers feel empowered through fantasies about being the elect, a small group of virtuosi chosen to proclaim the truth of new revelations before a reluctant world. Being in the minority and defying established orthodoxy serve as evidence for the correctness of their beliefs. Intimacy with the charismatic leader means sharing his power and wisdom, and energizes followers.

How do we measure performance, or success, in religious movements and especially in NRMs, as compared to secular organizations? How do we judge the effectiveness of a religious leader? Success requires creativity in the midst of competition and resistance. Some leaders, and some

groups, have shown remarkable resilience in the face of challenges and crises.

Charisma operates in attracting new recruits to a small group and retaining them. Founders of NRMs have sufficient charisma to attract the numbers of followers necessary to keep the group alive. In all of these cases, charisma as measured by the leader's ability to recruit followers has been limited. Most groups under discussion here had fewer than 100 members.

In some cases, charismatic leadership made possible not only survival but thriving in the face of insurmountable odds. One of the more remarkable cases of leadership in a new religious movement in the face of adversity and opposition involves the early history of the Church Of Jesus Christ Of Latter-Day Saints (LDS), known as Mormons. This Christian-polytheistic millenarian group was founded by Joseph Smith, Jr. (1805–1844) in 1830 in northern New York State. At age 14, Joseph Smith declared he had spoken with God. Later he had written a text known as *The Book of Mormon* and has given its name to the Church.

Smith announced to the world that he was “seer, translator, prophet, apostle of Jesus Christ, and elder of the church.” In 1835, 12 apostles were appointed and sent to gain converts in the United States. In 1835 Joseph Smith also prophesied the Second Coming. In its early years, the movement encountered much violence because of its unconventional beliefs and its advocacy of polygamy. Opposition forced the group to move first to Ohio, then to Missouri, and then to Illinois, where the city of Nauvoo was founded in 1840. In 1844 Joseph Smith and his brother were killed by a mob there. Again, the members embarked on a long voyage away from the Eastern United States, led by Brigham Young (1801–1877) and settled in Salt Lake City. It was Brigham Young who was responsible for saving the group from oblivion.

A less dramatic case of a lone founder who managed to create a small movement with no resources save his own personality is that of the little-known Emin (*The Template Foundation*), founded in London by Leo (aka Raymond Armin or Raymond Schirtenlieb, 1924–2002)

in 1972. The founder was a bankrupt never-do-well, who propagated Western “occult” ideas. Group followers numbered only in the hundreds in the high point of its existence, but the founder died a millionaire, and the group survived his death.

David Berg (Moses David, 1919–1994), founder of the Children of God (*The Family*) can be described as another man who used his personality to create a group known for its Christian antinomianism. It started in 1969 in California and gradually attracted global media attention. Berg told his followers that they were the elect and showed contempt for conventional sexual morality. This meant “sharing” wives of group members, child sexual abuse, and incest.

Over the past 50 years, researchers and media observers have used charisma as an explanation when faced with dramatic and shocking events that defy both understanding and imagination. They involved a form of leadership so powerful that it would create a selfless dedication to leader-defined goals, including self-sacrifice in death. A despotic vision creates an identity and a loyalty, which then veers towards an imagined “apocalypse,” which does not end the world, but the lives of most followers. Vulnerable, needy individuals fall in love and display not only compliance, loyalty, and adherence but total devotion and slavish submission. An excess of love becomes the root of horrifying events.

The tragedy of the Branch Seventh Day Adventists is well known. Originally, its members followed the teachings of Victor T. Houteff, who deviated from established Seventh-Day Adventist teachings in the 1930s by predicting the coming of a Davidian kingdom in Palestine. In the 1960s, Ben Roden (–1978) renamed the group Branch Davidians and was succeeded by his wife Lois (1915–1986). Their son George Roden (1938–) tried to become leader in the 1970s but was then ousted by a new leader, Vernon Wayne Howell (1960–1993), known after 1990 as David Koresh. Howell joined the Branch Davidians in 1982, became the lover of Lois Roden, and then assumed the leadership in 1987, after she died. He gathered a veritable

arsenal in the 1990s, including 350 guns and two million rounds of ammunition.

There was evidence not only of violent potential but of real murderous acts in the group long before any government intervention. In November 1987, David Koresh, fighting for the group leadership, was challenged by George Roden to a final showdown. Roden dug up the body of a Davidian who had been dead for 20 years and challenged Koresh to raise her from the dead. This led to a 45-minute gun battle, with Roden was slightly wounded. Koresh and seven of his followers were charged with attempted murder. The followers were acquitted, while Koresh won a mistrial and was never retried. George Roden left the group, and in 1989 shot his roommate and then cut the body to pieces. He was found innocent by reason of insanity by a court in Texas and hospitalized. In 1995, he escaped to New York, but was caught and returned to Texas.

On February 28, 1993, the group's compound near Waco, Texas was raided by more than 100 agents of the United States Bureau of Alcohol, Tobacco, and Firearms (ATF), searching for illegal weapons. The Branch Davidians opened fire, and four agents, as well as six group members, died. This led to a 51-day siege by the FBI and the ATF.

On April 19, 1993, as millions around the world watched the horror on television, the compound went up in flames. We know now that the fire was started by group members, who followed orders from Koresh. Seventy-nine individuals, including 22 children died. Five (or fourteen, according to other sources) of the children were believed to have been fathered by Koresh.

In the case of David Koresh, both sex and violence were heightened and visible for years, as was the prediction of the coming end. One aspect of the tragedy which has received some attention is the sexual exploitation and domination of group members and their children by the leader. In 1989, Koresh officially announced to the members his rights to all females, and some followers left because of this. At age 12, girls were moved to gender-

segregated quarters, where they became available to Koresh.

In January 1984, he legally married 14-year-old Rachel Jones, the daughter of a long-time Branch Davidian. In 1986, he announced his marriage to 14-year-old Karen Doyle, whose father was also a group member. Later that year Koresh "married" Michelle Jones, 12-year-old sister of wife number one. The contact with Michelle started in what seemed like a rape. Later he took at least three more wives, ages 17, 16, and 20, who had children by him. Later on, there was another "wife," whose relations with Koresh started when she was 13. It is also clear that in some cases, Koresh had sex with both a daughter and her mother. By 1993, there were more than a dozen women in the group who considered themselves the leader's wives.

Cases of fantasied rebirth gone tragically wrong have come to our attention in recent years. They include The Peoples Temple, Branch Davidians, the Solar Temple, and Heaven's Gate. Each case is unique. What is involved in all cases is an authoritarian leadership which sweeps the members into a cataclysm of killing.

Religious organizations are undemocratic by definition (and by claimed revelation), but these groups were totalitarian organizations where exploitation and violence were inherent. The questions we ask about these groups are similar to the ones raised about historical twentieth century totalitarian regimes. In every case of NRM tragedy over the past 50 years, there was a reality of despotism and exploitation, with extremely narcissistic leaders being followed by a group of dependent, obedient individuals. The feeling before the actual disaster is that the leadership, and the group, has reached the end of the road and is facing destruction or severe disruption by outside forces.

Long before the final cataclysm of violence, the undivided, unquestioning, loyalty by followers is very much in evidence through sexual subjugation which becomes public knowledge. This was the case with (the bisexual) Jim Jones in the Peoples Temple, David Berg in the Children of God, and David Koresh in the Branch Davidians. Joseph Smith Jr. also practiced sexual

domination over women in his group. Sexual abuse of followers is has been reported in hundreds of modern groups, ranging from Buddhist to Roman Catholic, and the popular concept of alpha male seems identical with charisma. With hindsight, it seems like followers were being deliberately manipulated, or engineered, into total submission through the leader's sexual domination. Some members left in response, but those who accept the leader's sexual tyranny are totally committed.

In a religious context, both success and abuse of power may be redefined as part of a cosmic salvation plan. When group members lose their lives in mass murder/suicide, the event is described as "moving to another level." This is not unique to NRMs, as martyrs in many traditions are promised eternal life. The abuse of power is justified by revelations, as in the cases of Joseph Smith, Jr., Jim Jones, David Koresh, and many others.

Reading the literature on NRMs, one is likely to encounter the term charisma most often when reading about abuse of power, exploitation, and mass murders. It seems that the latter are used to confirm and prove a leader's exceptional qualities. Charisma becomes an explanatory concept when faced with exceptional and shocking behaviors.

Charismata

Leila Chamankhah

Institute of Arab and Islamic Studies, University of Exeter, Exeter, UK

University of Dayton, Dayton, OH, USA

"*Charismata*" is the former usage of the new word charisma. Today it means two phenomena:

1. Spiritual gifts which come with charismatic endowments. These endowments include wise words, special knowledge, faith, miracles, prophecy, power to rule, healings, connection with divine grace, discerning of spirits, and diverse kinds of tongues as in religious leaders.
2. Nonreligious, non-supernatural, and secular applications as have been elaborated by Max Weber (1864–1920 CE). In both usages, charisma is the special quality some people possess that tends them "to be attractive to others, to be influential and inspirational, and to be characterized as brilliant and effective communicators." Despite its wide applications in humanities, it seems to be very difficult to define it. Hence, as Conger has rightly pointed out, "there is no generally agreed-on definition of charisma" (Conger 2004, p. 158).

As an adjective, charismatic characteristics or charismatic authority can be used to mean having a supernatural origin. In the New Testament, Paul writes of spiritual gifts/endowments or charismata, which is the first-known illustration of charismata. In this religious context, the term denotes any good gift that flows from God's benevolent love (*charis*) unto humans, any divine grace or favor originating in the Holy Spirit to distribute it for the good of others according to his discernment (1 Cor 12–14). In the same context, all such charismata are attributed not only to the chosen ones but to every Christian to be qualified to perform his task in the church (1 Cor 7:7).

This separation between general and special meaning of charismata also occurs in Romans. This word is used in Romans in the singular six times and refers to God's grace given by faith in Christ (Rom 5:15–16). Although the sinner should be sentenced to death, by faith in Christ, he is bestowed eternal life (Rom 6:23). In Romans (11:26) when talking about Israel, the term in its plural form refers to certain privileges – such as forgiveness and redemption designated by God to Israel. "*Charisma*," which is the newer form of the term "charismata," derives from the Greek word *charis* meaning "grace, kindness, and favor."

The German sociologist and economist Max Weber developed the term "charisma" and it

became a central theme in his writings. In his book *Economy and Society*, “charisma” is a certain attractive quality of an individual personality, either with a divine spirit or an extraordinary nonreligious secular quality, by virtue of which he is set apart from ordinary men (Holton and Turner 1989, pp. 454–455 [1384H, the year following the Hijrah, when Muhammad migrated from Mecca to Medina]). Weber’s original idea was to apply the term in a nonreligious meaning. In sociological analysis, “charisma” is a power of leadership or a certain type of authority that may have supernatural, superhuman, or any other kind of extraordinary origin. In this usage, “charisma” found its new place in the process of leadership and institution building in modern society. This definition of “charisma” is secular and asserts “denial of the validity of the sacred, and of what is accepted in any given society as sacred” (Eisenstadt 1968, p. xix).

In the Weberian sense of the word, “*charisma*” has also two opposite tendencies: to create and to destroy. This dichotomy between two different situations is the very potential of charismatic activities (Eisenstadt, xx). In Christianity, we perceive many concepts of charisma such as charisma of office (*Amtcharisma*), charisma of kinship (*Geltcharisma*), and hereditary charisma (*Erbcharisma*) or contact charisma. All of these concepts, “especially that of the charisma of office, have been used by Weber to denote the process through which the charismatic characteristics are transferred from unique personality or the unstructured group to orderly institutional reality” (Eisenstadt 1968, p. xxi).

There are two differences between religious, divinely usage of charisma and that of the secular. (1) In the religious context, charisma is mostly an inherited or inborn quality, whereas in the secular context, it is believed to be a constellation of personal characteristics. (2) Charisma in the Weberian usage more likely emerges during times of crisis and social upheaval; so it is situational. But in the former application, it is mostly individual. Contrasted to religious meaning, in the sociological context “charisma” is not regarded as

a gift, but an attractive influential force belonging to irrational, exhilarating aspect of life that appears to answer to the question of meaning.

Similar charismatic virtues are honored in other religious traditions. Some observers have perceived a model of leadership and authority in Shiite Islam as a charismatic leadership. In this sense, Shi’ism is regarded as a millenarian movement founded on the basis of the right of prophet Muhammad’s male descendants for leadership. Every descendant, who is called “Imam,” inherits leadership from the former one up to the twelfth Imam who entered on occultation at 842H. (“Occultation” in Shiite Islam refers to a belief that the twelfth Imam who is the messianic figure was born but disappeared and will 1 day return and fill the world with justice.) Imams are recognized as charismatic leaders possessing this quality as inborn and should have it by their office too. Such beliefs have served to unite the faithful community over history. In this sense “charisma is considered the result of contact with a supernatural being from which the individual receives revelation and power enabling him to mediate spiritual grace to other people” (Parrindeh 1987, p. 218).

One can also find this tendency in Judaism. In this cultural context, the notion of *Barakah* among Muslims and of its Jewish counterpart *zechut avot* (ancestral merit) “connote a strong sense of inherited blessedness and ascribes virtue” and regarded as a source of legitimation and charismatization (Bilu and Ben-Ari 1995, pp. 226–229).

In Islamic philosophy, the term “*feyz*” literally means “grace” in the same sense as charismata in Christianity. *Feyz* is the first practice of God: everything emanates from Allah, since he is the Prime Agent. Therefore, the Prime Agent or *Fayyaz* – the one who emanates *feyz* or grace – is the very self-existent (Arab 2007, p. 424). In this sense, *feyz* means kindness. Some Islamic philosophers such as those who believe in the School of Illumination also use the term “*light*” (*noor*) instead of *feyz* to refer to the act of emanation. God is called light or “light of lights” (*noor al anvar*). Allah’s flow of emanation, or the rise of

the sunlight over everything, would not be cut off. His eternity necessitates the everlasting process of emanation flowing from him onto beings (Suhrevardi 1976, p. 186).

“In this sense,” as Hossein Nasr says, “the mind of a human being is continuously illuminated by the light of the Divine Intellect and revelation and protected from error by the grace provided by God” (Nasr 2006, p. 32). In fact, this interpretation of *feyz* or grace as light has its origin in Zoroastrianism (Nasr 2006, p. 229). In the religious application of the term, charisma is an extraordinary gift that mostly refers to kings and prophets. This godly gift is called *xvarnah* or *xvarah*. In the two ancient languages of Pahlavi and Avestai, the term means that the light or shining emanates from God onto Persian emperors in supporting them to govern, defeating their enemies, organizing society, constructing civilizations, discovery and contrivance, prophecy, intuition, and so on. Here again the original source of the term is religious (Nafisi 2002, p. 31). But in some cases, God chooses a certain individual – not necessarily a prophet or a king – who himself owns a personal capability requesting *Farrah* from God and through hard trainings become worthy to receive it (Dehghan 2002, p. 163). So, it seems that in this context, the separation between the secular and the religious, as it is predominant in Christianity, is confusing. The charisma of the kings could not be regarded clearly as religious as opposed to nonreligious and secular charisma. It is both a constellation of personal characteristics and divine gifts and endowments.

“*Farrah*,” the newer form of the old words *xvarnah* or *xvarah*, has different meanings such as glory, greatness, light, force, and special authority of kings and prophets (Tabatabae'i 1996, p. 134). In narrower meanings resembling Christian usages, *Farrah* refers to some qualifications such as to think, to speak, and to act according to the “Just Religion” which is Zoroastrianism (Avesta, *Zamiad yasht*, 1:9). These modes are Zoroastrian styles of thinking, speaking, and acting (Avesta, *Zamiad yasht*, 1:79).

Farrah has two aspects: the first aspect enforces its human owner to do his or her social, spiritual, and moral responsibilities; authority;

guardianship; and rule. The second aspect refers to the charismatic's insight into God and relation to Him (Dehghan 2002, pp. 27, 37, 163).

In modern usage, we also find charismatic movements founded by charismatic individuals possessing a human quality, which is mostly a leadership quality, without reference to the supernatural or divine grace. For example, despite the dissimilarity in their political aims, when we speak of Khomeini and the Islamic Revolution he headed, Gandhi's India, or Adolf Hitler, we do not intend some charismatic characteristics such as healing and revelation, but rather admiration and respect (Hajarian 2001, p. 170). In this sense, there is usually an elating unity between leader and followers. This relationship is precarious and the state of charismatic authority is transitory and “problems of political continuity necessarily accompany such a phenomenon” (Kruger and Silvert 1995, p. 296).

The concept of charisma has evolved over the years, progressively shifting from its religious usage, in which a certain individual is granted spiritual gifts of divine revelation, prophecy, special knowledge, faith, and leadership. The sociological usage is predominantly leader centered, situational, and secular. This nonreligious use was begun when Max Weber examined varieties of charismatic authority. For Weber, although charismatic individuals possess an extraordinary quality, the relationship between the leader's qualities as a charismatic individual on one hand and the followers' devotion to the leader on the other hand is of more importance.

Charisma is also found in other religious traditions such as Islam and Judaism, which is labeled under *Barakah* and *zechut avot*, respectively. Currently, one can observe that “charisma” is used as synonymous with popular appeals in magnetic or alluring movements, religious or not.

Charity

Kate M. Loewenthal

Department of Psychology, Royal Holloway,
University of London, Egham, Surrey, UK

How has charity been seen in religious tradition? How has it been understood by psychologists? What are the relations between religious affiliation and charitable activity, and how well do we understand the psychological processes involved?

Religion and Charity

The practice of charity is demanded in all religions (Argyle 2000): all major religions have clear requirements – Buddhism, Christianity, Hinduism, Islam, Judaism, and others. Charity is generally seen in two ways in religious tradition. First, donating a fixed proportion of one's income and agricultural produce to appropriate beneficiaries is a religious duty. Religious traditions also endorse providing assistance – financial, food, and whatever else is required – to the needy. These two practices overlap, but there are distinct religious duties: taking and donating a fixed proportion of property, even if there is no desperately needy recipient and assisting the needy – even if one has already given away one's tithes, one is still obliged to help. Charity is considered as enhancing the spirituality of the donor and is regarded by many commentators as the highest religious virtue (e.g., Porter 1993; Shneur Zalman of Liadi 1796/1973).

Psychology and Charity

In psychology, the term “charity” is seldom indexed in social psychology and psychology of religion textbooks. This does not mean that the topic is seldom studied: charity has come under the heading of altruistic behavior in general

(Macaulay and Berkowitz 1970). Altruism has been defined as “behavior that aims at a termination or reduction of an emergency, a neediness, or disadvantage of others and that primarily does not aim at the fulfillment of own interests” (Montada and Bierhoff 1991), the behavior being carried out voluntarily.

There was an early debate about whether altruism, helpfulness, and charity can be truly selfless or whether they result from innate own group and kin helpfulness or other motivations which are not selfless. These include increased status, social desirability or social approval, and the assuaging of guilt (Carlsmith and Gross 1968), and the closeness of the relationship between donor and the person requesting or needing the help (Maple 2012). There has been focus on positive psychology and the benefits and importance of practicing psychological strengths. Seligman (2002) has argued that the practice of charity and kindness results in greater psychological health. For example, Thoits and Hewitt (2001) examined the positive consequences for well-being flowing from volunteer work. Park et al. (2004) showed that love and kindness were among the character strengths consistently and robustly associated with life satisfaction. Loewenthal (2007) cited the case of a depressed holocaust survivor who reported a steady gain in psychological well-being after being advised by a rabbi to give charity regularly.

How Does Religion Affect Charity?

Does religion promote altruism in general and charitable behavior in particular? Most recent work has supported the view that this is the case (Inaba and Loewenthal 2009). For example, in the UK, in 1993, those for whom religion was said to be very important gave about \$50 monthly, compared to \$15 monthly from those who said religion was not important (Argyle 2000). In the USA (Myers 1992), weekly church attenders gave away 3.8% of their income and nonattenders, 0.8%. Regnerus et al. (1998)

reported that charitable giving was affected mainly by whether a person professed a religion, regardless of what that religion was. The relations between socioeconomic status and charitable giving are slightly complex, but on the whole, the better-off give away more. The straightforward explanation of these findings is that religiously active people are likely to behave according to religious injunctions. The relations between religion and charity apply not only to financial giving but also to voluntary work (Lynn and Smith 1991) and to humanitarian compassion (Perkins 1992). Religiosity is a much better predictor of charitable giving and activity than is economic status, and religion predicts giving to nonreligious causes as well as to religious causes (Brooks 2003).

Conclusion

We can conclude that there is growing evidence that religious activity and identity correlate very reliably with the practice of charity, and some suggest that charitable activity may promote psychological health. There is great scope for more detailed investigation of the cognitive and motivational factors that underlie these effects.

Child

Philip Browning Helsel
Pastoral Care and Counseling, Boston College
School of Theology and Ministry, Chestnut Hill,
MA, USA

In describing the significance of the child and childhood, a brief historical overview provides a perspective in which to place the developments of psychology and religion in relation to the child. In

the classical period, children were not considered individual beings, but were useful to the family and society in the fact that they would eventually become good citizens (Cunningham 2005, p. 23). In antiquity, children were often abandoned when families were not able to take care of them, to the extent that almost every family had abandoned at least one child (Cunningham 2005, p. 19). Christian emperors challenged this practice but seemed to not enforce penalties for it (Cunningham 2005, p. 25). Developments in theology increased the visibility of the experience of the child. With Augustine's *Confessions*, and his development of the idea of original sin, the child began to be seen as being "on par with the adult" in terms of its "moral dilemmas" (Cunningham 2005, p. 26). Caregiving and childrearing began to concern adults in the Middle Ages, as evidenced by the publication of literature relating to the care of children (Cunningham 2005, p. 29). However, it seems that the child of the medieval period was understood as less than fully human, being described as "lacking in adult attributes, marked by his or her deficiencies" (Cunningham 2005, p. 34).

An important transition began to take place from the era of Humanism and the Reformation, culminating in the nineteenth century. People started to believe that what happened to a child would contribute to what the adult person would become. Children thus became the subject of interest and even idealization. During the height of Romanticism, children were described as "fresh from the hand of God," but at the same time, some Puritan writers called for "rigid disciplines" which would break the will of the child (Cunningham 2005, pp. 29, 69). During the eighteenth century, especially among the middle and upper classes, a "wall of privacy" separated the family from the wider world, and the home came to symbolize the safe haven from the degradation which surrounded it (Cunningham 2005, p. 59). On the other hand, with the advent of industrialization, poor children were separated from their families at the age of ten and forced to work in grueling circumstances under the supervision of strangers (Cunningham 2005, p. 89).

The twentieth century has been called the “century of the child” (Cunningham 2005, p. 170). First, state governments took over from philanthropic organizations to provide compulsory schooling and outlaw child labor. Second, psychology demonstrated the influence of childhood on the adult self and began to see children as sexual persons. Finally, children began to be viewed as agents with rights (Cunningham 2005, pp. 160, 177). In the second half of the twentieth century, children asserted this autonomy as “parental authority declined,” “[demanding] and [receiving] entrance into the adult world” in their teenage years (Cunningham 2005, p. 194). As children became members of the consumer culture, they began to exercise authority in ways that would have been unimaginable in previous centuries. In spite of this fact, children continue to be the victims of abuse and neglect and are seldom seen as complete persons, either in religious settings or within the wider culture.

Commentary

Psychology was born at the beginning of the “century of the child,” and it provided its own view of childhood, suggesting that the riddle of the adult self was rooted in the experience of the child. Freud once claimed that the development of the superego was a direct result of the unusually long period of dependence on her parents which the human being experiences (Freud 1923/1960, p. 31). In his controversial *Three Essays on the Theory of Sexuality*, Freud described childhood as a time in which the child experienced sexual satisfaction at the hands of her caregivers and began to entertain fantasies in relationship to them (Freud 1905/1962, pp. 90, 93). Freud concentrated his clinical work on the oedipal period, spanning between the ages of three and five, when the child negotiates these fantasies. If they are unresolved and repressed, they can become the bedrock for future neurosis, but if they are accessed through psychoanalysis, they can serve as a source of creativity. Freud occasionally alluded to anecdotes about children but only seems to have had one child patient, Little Hans

(Freud 1920/1961, p. 13). Most of his clinical conclusions about childhood were drawn from his interpretations of the free associations of his patients, attempting to break through the barrier of repression that blocked out all memory of childhood sexuality.

In a quite different approach, Carl Jung explored the prevalence of the Divine Child motif across a wide range of religious and mythological material and suggested the presence of a “child archetype” (Jung and Kerenyi 1949, p. 111). This archetype gave the person who was in the process of individuation a ground in the “still existing state of childhood,” thereby freeing her for future growth in responsibility (Jung and Kerenyi 1949, p. 113).

Anna Freud began direct work with children which shaped the development of ego psychology the theoretical field for which she was largely responsible. Erik H. Erikson began his psychoanalytic career teaching in a Montessori school under his tutelage and continued this interest in the direct experience as a source of psychological insight. In his first book, *Childhood and Society*, Erikson studied children in a variety of societies and cultures, placing the problems and concerns of children front and center (Erikson 1950/1963). While Freud thought of dreams as the “royal road to the unconscious,” Erikson suggested that it was actually the play of children. Reflecting on the sayings of Jesus late in his life, Erikson marveled that Jesus claimed that the “kingdom” is only available to those who “turn and become like children” (Erikson 1981, p. 348). Erikson considered this exhortation to the “preservation and reenactment of the wonder of childhood,” to be a humbling word to those psychologists who imagined they had “discovered” childhood in the first place (Erikson 1981, p. 349).

The child’s earliest experiences became important in the object relations school of psychoanalytic psychology. Margaret Mahler’s influential theory of infant development traced the adult psyche back to the earliest experience of the child with his mother (Mahler et al. 1975, p. 43). From this perspective, the child’s relationship to his mother in the preoedipal period proved to be

important to psychic health in even more fundamental ways than the child's resolution of the oedipal complex. D. W. Winnicott, a pediatrician who became a psychoanalyst in the object relations school, focused his clinical work on the direct observation of mothers and infants and developed the theory of the transitional object. The transitional object was an object chosen, or "created," by the child that existed in the space between mother and infant. This object received the child's affection and rage, yet remained intact, thereby helping to establish the child's own sense of self.

For Heinz Kohut, being denied the original experiences of childhood narcissism in which one is the object of love and attention can provoke serious and long-lasting damage in the child and subsequent adult. Kohut found himself increasingly working with persons who had an extremely fragile self-structure, including feelings of unreality and a strange sensation of the passage of time. Kohut suggested that while "classical analysis discovered the depression of the child in the adult," his own version of psychology had "discovered the depression of the adult in the depths of the child," in the child who senses that her development will not be fulfilled and thus sabotages her own growth with isolation (Kohut 1985, pp. 215–216).

Religion has attempted to address the needs of children, but it has also perpetuated many myths that have been harmful to children. Judaism was born in a Near Eastern context in which child sacrifice was a current religious practice. In spite of the attempts to distance themselves from this demand, stories such as the binding of Isaac and the sacrifice of Jephthah's daughter indicate that such traces had not entirely disappeared (Bergmann 1992, pp. 76, 93). In a psychoanalytic view, such images perform an important function, bearing their roots in the "murderous wishes of children directed at their parents and murderous wishes of parents directed at their children" (Bergmann 1992, p. 314). David Bakan focuses on the latter, suggesting that Job may have not lost his children, but wished they were dead, as a reflection of a father anticipating his own rejection

(Bakan 1968, pp. 110, 116). Religion addresses the trauma of a forbidden and buried past, but in its attempts to do, it may sometimes leave traces of the original wish. In the case of Christianity, the trauma of these wishes is reflected again in the sacrifice of the Son to the Father (Bergmann 1992, p. 315).

There are also more redeeming traces of the meaning of children within religion. As mentioned earlier, the statement of Jesus that all must become like children as well as his invitation to children to be close to him provide counterpoints to some of the cruel imagery of the Judeo-Christian tradition, even that which stands behind his own sacrifice. The intimacy with which Jesus addressed God, using the familiar Aramaic form for father, indicates the childlike nature of religious belief. Religious persons have often seen themselves as God's children and thus incorporated into a wider family in which they are cared for by God.

However, within religious circles, children themselves have often been neglected as sources of insight. While the education and moral formation of children has been a traditional religious activity, the experience of children itself has seldom served as a centerpiece of theological thought (exceptions are Coles 1991; Miller-McLemore 2003; Lester 1985). Frequently, those who educate children in religious faith are not given the same status as ordained leaders in the tradition. In the same way, religion frequently neglects the actual experience of children, focusing instead upon adult emotional and spiritual needs.

Child Abuse and the Psychology of Religion

Sana Loue

Faculty Development and Diversity, Department of Bioethics, Case Western Reserve University School of Medicine, Cleveland, OH, USA

There is sometimes disagreement between health, mental health, and law enforcement professionals as to whether a specific incident can rightly be referred to as child abuse. Whether parental behavior is characterized as abuse is frequently influenced by factors such as the seriousness of

any resulting injury, the age and developmental level of the child, and the frequency or chronicity of the act. Societal perceptions of what constitutes abuse, in contrast to discipline, may also vary across regions and time periods. Despite the variation that exists in the definitions of child abuse and neglect relied on by researchers and by government, social welfare, and law enforcement agencies, it is now recognized that the maltreatment of children in high-income countries, including the United States, constitutes a major social welfare and public health problem.

Child abuse is rarely explainable by one determinative factor. Rather, a multitude of circumstances likely contribute to parental behavior that may be considered abusive. Parental approaches to child rearing are influenced by individual-level characteristics, such as the parent's personality; the parent's formal and informal networks (exosystem), such as those that are developed through employment, school, place of residence, and religion; and the larger environment in which the parenting occurs (macrosystem), that is, the cultural, social, legal, and political environment, including shared beliefs, values, norms, and behaviors. Parents obtain support from within these systems: emotional support in raising their children and guidance and instrumental support in the form of advice and assistance with child rearing.

Some individuals may look to their religious affiliation and religion-related activities as sources of support in their childrearing efforts. Accordingly, how individuals interpret the scriptures of their faith, how clergy depict the meaning of that scripture, and the extent to which parents rely on their clergy and their faith community for a sense of identity and acceptance have enormous implications for how they raise their children. Religious leaders may serve as an important source of advice to parents on the issue of child discipline.

It has been suggested that individuals who read the Bible literally may be more likely to abuse their children physically, relying on passages such as those found in Proverbs 13:24 ("Those who spare the rod hate their children, but those who love them are diligent to discipline them") and

Proverbs 22:15 (“Folly is bound up in the heart of a boy, but the rod of discipline drives it far away”). However, there are no empirical data to support this presupposition.

Research has, though, found an association between exclusive reliance on faith-based care and what has been termed the medical neglect of children. Exclusive reliance on faith-based care, such as prayer, the laying on of hands, and exorcism, may in some situations lead to the disability and/or death of the child that would have been otherwise preventable through the use of standard medical care. In some instances, such as the use of conversion or reparative therapy to “convert” a homosexual child to heterosexuality, the religiously based treatment may cause the child to have a disorder where none existed previously, e.g., depression. Parents whose children are not healed through such efforts or who die despite such efforts may find themselves blamed and isolated by their religious communities for the perceived inadequacy of their faith.

Adults who have experienced abuse as children, whether or not that abuse was premised on religious beliefs, not infrequently change their religious affiliation, reject religion or formal religious practices, and/or believe that God is distant or unloving. In some cases, religiosity or spirituality may moderate the development of posttraumatic symptoms. Mental health professionals providing services to clients who have suffered abuse associated with religious beliefs may find that some clients wish to explore their relationship to religion and a deity, while others reject an exploration of such issues. In some communities, spirituality-based intervention programs for the treatment of abuse-related trauma may be available.

Mental health providers may work not only with clients who have been abused but also those who have been implicated in the commission of child abuse. Just as some scriptural passages may be interpreted literally to characterize and/or justify abuse as recommended discipline, so too can scriptural passages be utilized to counsel alternative approaches to child rearing. As one example, Psalm 37:8 provides, “Refrain from anger and forsake wrath.” In some circumstances,

mental health providers may find it helpful to consult with clergy to gain additional understanding of possible approaches.

Chinese Cowherd and the Weaver Girl

Minqin (敏) Wang (王)¹ and Lee W. Bailey²

¹College of Foreign Languages and International Studies, Hunan University, Changsha, China

²Department of Philosophy and Religion, Ithaca College, Ithaca, NY, USA

“The Cowherd and the Weaver Girl” is one of the four great love legends in China. This was listed by the Chinese government as one of the intangible cultural heritages in 2008 (ihchina). The

legend expresses the conscious and unconscious themes of separated lovers.

The Mythical Legend

There are mainly two versions of the mythical legend as described below. They express the ancient Chinese beliefs that souls can appear as stars and do cosmic tasks similar to earthly ones and can be reborn on earth as gods/goddesses or people, according to their karma.

Version One: The Emperor of Heaven as the Authority

According to the story in *Xiao Shuo* edited into the encyclopedia-style book *Records in Tianzhong* by Yaowen Chen in the Ming dynasty (1368–1664 CE) (Yaowen). There was a weaver girl (*Zhi Nü*) in the East of the vast starry River of Heaven (the “Silver River” in Chinese, the “Milky Way” in English), who was the precious daughter of the Emperor of Heaven.

For 10,000 years the Weaver Girl (*Zhi Nü*) had woven stunning, enchanting, colorful clouds into the starry clothes of the sky. But she was lonely and sad. So the Emperor of Heaven took pity on her loneliness and married her to the Cowherd (*Niu Lang*) in the West of the River of Heaven.

They were very happy, but she stopped weaving after marriage, just indulging herself in the cozy family life and neglecting her cosmic weaving task, which made the Emperor of Heaven very angry, because everyone loved to gaze at her colorful clouds of stars. So he ordered her back to the East of the River of Heaven and only allowed them to meet during the evening of July 7 every year.

The story of this version happened largely in Heaven. So we can say that it is a myth (Fig. 1).

The star’s photo shows the positions of (1) the star *Niu Lang*, the Cowherd, that is the left lower star of the triangle, which belongs to the Aquila constellation (the upper star of the triangle is Aquila) and (2) the star *Zhi Nu*, Weaver Girl,

Chinese Cowherd and the Weaver Girl, Fig. 1 The Silver River (Milky Way) and the Lover Stars (Baiké) (copyright-free)

that is the right middle star of the triangle in the Silver River (Milky Way).

Version Two: The Queen Mother as the Royal Authority

This version is longer, more widely spread, and well-known in China. It first took place in Heaven, developed on Earth, and ended in Heaven. The Cowherd (*Niu Lang*) and the Weaver Girl (*Zhi Nü*) have long been seen as two stars in Heaven, who loved each other deeply. But their love was against the heavenly principle, because only those who have gotten rid of human desires could become a heavenly star and stay in heaven forever. Otherwise they would have to become a human again, because of their own human-like thoughts and actions. So the Cowherd star was banished from Heaven to the human world on Earth. As the granddaughter of Queen Mother (*Wang Mu Niangniang*), who was the leader of

all Goddesses, the Weaver Girl star was punished by having to weave “the clothes of the sky” – awesome, wondrous, beautiful colorful clouds, with magical silk, that change according to the different times and seasons.

After the Cowherd star was expelled from Heaven, the Weaver Girl star was so sad that she often washed her face with tears because of missing him. She turned to weaving incessantly, in order to try and make Queen Mother happy, so that the Cowherd star could come back to heaven sooner. One day, another sympathetic Goddess begged the permission of Queen Mother to let the Goddesses and Weaver Girl swim in the Green-Lotus pool on Earth. Queen Mother took pity on the Weaver Girl star, allowing her to swim together with the Goddesses, but she required that they must go back to Heaven without delay.

Meanwhile, for his daring to love the Weaver Girl, daughter of the Emperor of Heaven, the Cowherd was banished from heaven, then born in an earthly farmer’s family, and named *Niu Lang*. After his parents died, he lived together with his elder brother and sister-in-law. His sister-in-law treated him so badly that he had to live by himself with an old cow. But this was a special cow who was highly spiritual. One day, the old cow suddenly spoke to *Niu Lang*, saying “*Niu Lang*, you should go to the Green-Lotus pool today. There are some Goddesses swimming there; hide the red robe, and its owner will become your wife.”

Niu Lang was very surprised to find the old cow talking, but he did as he was told. When they saw the country boy *Niu Lang* approaching, all the other Goddesses flew up to the sky like birds, and only the Weaver Girl star was left, because she could not find her robe. But she quickly found her robe and put it on. Then, when *Niu Lang* approached the beautiful Weaver Girl Goddess, and asked her to marry him, he did not know who she was. But she was the Weaver Girl star (who was later called *Zhi Nü*). The Weaver Girl was so thrilled to be reunited with her beloved *Niu Lang*, the one she missed day and night! So they happily married on Earth and later had one son and one daughter. But such human love was forbidden in heaven. When this was discovered by the Queen

Mother, she was so angry that she sent some heavenly warriors and generals to Earth to take the Weaver Girl star back to Heaven.

As the warriors approached, one day while *Zhi Nü* was making food at home, *Niu Lang* hurried back home from the field and sorrowfully spoke to her with red swollen eyes: “Our elder brother, the cow passed away. But before death, he told me to take off his skin and deposit it in a safe place, so I can fly to the sky with it someday.” Hearing this, *Zhi Nü* was puzzled about the cow’s death, because she knew the cow was the Golden-Cow star, who was also expelled from Heaven for his trying to argue with Heaven for fairness for the Cowherd star.

Then just when they took off the skin of the old cow and buried it, a strong wind arose. Suddenly, the heavenly warriors and generals encircled them, grabbed the Weaver Girl star and fled up into the sky! This astounded and startled the Cowherd *Niu Lang* so much that he did not know what to do. Then he heard the cow’s voice urging him to quickly take his cow skin and chase up into the sky after his beloved Weaver Girl *Zhi Nü*. Soon *Zhi Nü* heard the voice of *Niu Lang* following and calling to her.

Looking back, she was excited to see *Niu Lang* flying nearer and nearer to her, with the cow’s skin on his shoulder and at the same time carrying their two dear children in a pair of bamboo baskets. But, when they almost met, the Queen Mother arrived on the clouds. She took out her golden hair fork and drew a cosmic line that divided the two lovers. It became a vast heavenly river (the Milky Way, or Silver River in Chinese). Its roaring waves appeared, which separated the family forever.

The two lovers on each side of the river cried so hard that even the heavenly warriors and generals could not help being sad, and this also moved the Queen Mother. So, she relented a bit and allowed *Niu Lang* and the two children to stay together in Heaven. She asked a crow to pass the order that the family was allowed to meet every 7 days, but the crow misunderstood it (an old folktale motif) to mean once a year on July 7. Magpie birds were so moved by their love that they came to make a colorful bridge

Chinese Cowherd and the Weaver Girl, Fig. 2 The Cosmic Lovers rejoice (Baiké) (copyright-free)

over the Silver River with their bodies and let them unite there.

Hence, in the autumn evenings, people will see a big and bright star twinkling on each side of the Milky River, which are the Cowherd star, holding their son and daughter, and the Weaver Girl star. According to the legend, if people on earth listen quietly among the grape leaves on the evening of July 7, according to the Chinese lunar calendar, they will hear the fairy music and the chattering of the two happy lovers.

In ancient records, the Weaver Girl was regarded as being beautiful and versatile, so girls usually beg for intelligence and crafts from the Weaver Girl on the evening of July 7, so that day is also called “the day of begging for skills.” Because the participants are mostly girls, the day is also called “the daughters’ day.” On that day, women, especially daughters, will gather in the court with new clothes, put all kinds of fruits and cakes on the tables, kindle the incense, and pray for the two stars. This ritual is to ask the heavenly couple to bless the girls so they can be more skilled in crafts, be more intelligent, and have a

happy family. Then they would be able to communicate with each other, teach other girls different ways of needlework, embroidery, and other crafts.

The Fig. 2 photo shows the family uniting on the Magpie bridge.

The Conscious and Unconscious in the Mythical Legend

From the first version, in which the Heavenly Emperor as the authority, we can see that the text is mythic. The Emperor of Heaven represented and sanctified earthly patriarchal social power, which his daughter obeyed. Perhaps she did not dare to complain, because we did not hear her complaining of her hard work and loneliness, let alone her wish to marry. Maybe her enjoying marriage was her unconscious rebellion against the heavenly law, although consciously she accepted the law. After her father married her to the cowherd star, her happy married life with *Niu Lang* aroused her desire for a more cozy, comfortable life, immersed in her unconscious, and led her to give up her work as the weaver of colorful heavenly clouds. But this way she stirred up her Father’s anger, and so he separated her from her husband.

The earliest recording of the two-star symbolism was in *Shijing*•*Xiaoya*•*Dadong* (《诗经·小雅·大东》). The eight-line poem only described what jobs the two stars were doing; it does not mention their relationship. A complaint of heavy work and less reward was regarded as criticism of the cruel domination of the rulers in Western Zhou dynasty (1027 BCE?–771 BCE).

Perhaps in the Western Zhou dynasty people lived a tough life, working hard but getting less, so they began to admire the good life of the Shenxian (roughly equal to “god and goddess”) represented by the stars. Star worship in China has existed since ancient times. When people were observing the two stars that can be seen clearly on each side of the Silver River in the evenings of July, they imagined the stars to be working hard (twinkling all the time) but owning nothing. So perhaps consciously the poem expressed people’s

complaint, but unconsciously, it implied a kind of encouragement to endure a hard life, taking the stars as an example to learn from, as well as the hope for a happily married life. This conflict drives the story.

The poem in *Gu shi shi jiu shou • tiao tiao qian niu xing* (《古诗十九首•迢迢牵牛星》) first depicted the love story between the cowherd star and the weaver girl star. When it reached the period of Southern and Northern dynasties (420–589 CE), the myth developed into a legend marked by the stars coming to live in the human world, as in the version of Queen Mother as the authority.

Chinese traditional religious culture, Confucianism, Daoism, and Buddhism, all are strongly against excessive human desires, especially sexual desire, which is regarded as the greatest evil because it is the primary reason leading to *samsara*, so romantic love is not allowed in heaven. That's why the Cowherd star and the Weaver Girl star did not protest when he was expelled from Heaven, because they clearly knew they had violated the heavenly law.

Niu Lang and *Zhi Nü* lived a typical happy family life as a woman weaving at home with her husband farming outside. But consciously she knew that her love and life in the secular world was against the heavenly law. That is why she did not rebel against heavenly authority after being discovered, which shows her deeply rooted unconscious respect for divine authority. In the second version, heaven's authority is represented by the Queen Mother, the maternal power.

Because the crow unconsciously made them meet only once a year by wrongly passing the information, it has been used to refer to those who announce bad news as having a “crow's mouth” – the saying that usually indicates that there are bad things to happen. Also, because the magpies are glad to make a bridge to help them to meet, they have been called “the happy birds” – this is the saying that usually indicates that there are good things to happen.

The overall and worldwide psychological theme is one of separated lovers and social-

religious pressures that try to keep them apart. The lovers' struggle, between being required to obey authority and their desire for love and marriage, is a widespread social-religious and romantic-psychological tension, also evident in Shakespeare's “Romeo and Juliet.”

Chinese Popular Religions

Mayfair Yang

Department of Religious Studies and Department of East Asian Studies, University of California, Santa Barbara, CA, USA

Despite restrictions and prohibitions by a modernizing state, first by the Guomindang government of Republican China (191–1949) and then more severely and systematically attacked by the Chinese Communist Party (1949–the present), Chinese popular religion continues to be practiced in China and the offshore Chinese communities of Taiwan, Hong Kong, Singapore, and pockets in Southeast Asia. Long condemned by Western missionaries and Chinese intellectuals and officials as “backward,” “superstitious,” and an obstacle to China’s modernization, since the 1980s in Mainland China, popular religion has sprung back to life in many parts of rural and small-town China. The boundaries between popular religion, Daoism, and Buddhism are very porous, and people often feel free to worship in deity temples as well as Daoist and Buddhist ones.

The rational state ideology of national identity, patriotism, and economic development has not been able to satisfy people’s psychological, emotional, and spiritual quests for the meaning of life and death and for a deeper connection with family and local community rather than the nation-state. Through rituals to honor deities and ancestors and to ward off demons, people express their desires for health and longevity in the face of unpredictable natural forces that rule the earth and the human body. They also exhibit a longing for family prosperity, an ethical society, and social justice in an often corrupted social world where the strong, such as officials, often oppress the weak. The gods, goddesses, buddhas, bodhisattvas, and Daoist immortals are regarded as benevolent forces that are omniscient and legitimate because they help the needy and uphold ultimate justice by punishing evildoers in this world or the afterlife. Thus, when human officials

and the law fail to function as they should, there is psychological solace in a notion of ultimate justice that transcends human life spans.

Shamanism

Shamanism is also called “spirit possession” or “spirit mediumship” and its history extends far back into archaic China. Today, shamans are gifted individuals who have special abilities to see and communicate with ancestors, gods, and demons in other worlds and are also believed to heal illnesses where modern medicine has not succeeded. Male shamans are often called *shenhan* or *shentong*, and female shamans are often called *linggu* or *wupo*, although *wupo* has a slightly pejorative sense. The act of inviting, speaking to, and being possessed by a spirit is called *tiaodashen* (跳大神) or “dancing for the great spirit.” In trying to diagnose a medical or psychological problem of their clients, shamans enter into altered states of consciousness, losing their self when their bodies are overtaken by a deity, ancestor, or demon who speaks through them, often in an unfamiliar voice. When the shaman awakes, he or she may not remember anything from their trance, but they often know what steps their clients can take to appease an angry spirit and improve their situation. In healing illnesses, shamans will prescribe prayers and chants, rituals, food and alcohol offerings to spirits, good deeds, and sometimes the burning and ingesting of magical written talismans. Shamans usually operate out of their own homes, where they receive their clients and perform rituals, but sometimes a local deity temple allows them to operate there in public. In many areas of China today, female shamans outnumber male ones.

Feng Shui (風水) or Chinese Geomancy

Chinese civilization invented the magnetic compass or *luopan* several thousand years ago, but it was not used for navigation until much later in its

history. Early compasses were used to site graves, tombs, and dwellings in auspicious locations and directions to ensure the well-being and good fortune of their occupants and their families, kinship networks, and descendants. Today, as the Chinese government increasingly bans earth burials, *feng shui* masters now often apply their expertise to siting new homes, factories, and office buildings.

A primary principle of *feng shui* (which means “wind and water”) is that human constructions should be in accordance with the flow of *qi* (pronounced *chee*) in the landscape. *Qi* is the originary “life force” or “vital energy” of the universe that flows through the cosmos, the veins of the earth, and throughout the human body. *Qi* is believed to endow life-giving positive energies. The compass taps into the earth’s electromagnetic field in order to establish the best ways to ensure the smooth flow of the *qi* towards the structure or to block the bad energies or feared unconscious energies. Hills, large rocks, the slant of the land, and bodies of still or running water in the landscape must also be taken into account when siting against the four cardinal directions. The temporal dimension, such as the current season, and alignments with particular stars and constellations in the heavens are also important. The ancient technology of the eight trigrams is another central principal of *feng shui*. Each trigram is composed of three horizontal lines, either broken or unbroken, giving eight variant trigrams. These eight trigrams are based on the waxing and waning of *yin* and *yang* forces in the cosmos at a particular time and the alternating five phases of the “five elements” (metal, earth, fire, water, and wood) which make up the earth’s matter. Finally, the number of the family members and their sex also play a role in determining how to site the structure. *Feng shui* seeks to locate and align the self and loved ones into the natural terrain in a balanced way, in harmony with the movement of *qi* energies and natural laws, so as to ensure smoothness, stability, and security in their lives. It is believed that radical intervention and violation of natural flows will disturb natural balances and cosmic order, resulting in misfortunes in life. Thus,

psychologically, not consulting a *feng shui* master before building will result in anxiety for the future of one’s family and descendants.

Divination

When a family member dies, many families consult a diviner to calculate the best date and time to hold the funeral, because the right timing will ensure family prosperity. Indeed, any important undertaking, activity, or event calls for consulting a diviner. People want to know whether or not to start a new business and when to start it, whether or not to marry or divorce, whom to marry, whether they will have a son or daughter, when to start a long trip, whether their child will pass an important examination, or whether they will recover from an illness. On the eve of the Chinese New Year, crowds will flock to the most popular local temples to consult with diviners about what the New Year will bring them in good or ill fortunes.

Ancestor Worship and Appeasement of Ghosts

Ancient ancestor worship is part of Confucian culture which teaches filial piety towards one’s parents and respect for the elderly and regular rituals to honor and remember them after they are deceased. Within the home, photographs of the deceased parents and grandparents are often hung up and receive incense and food offerings on their birthdays and festivals. The annual Qingming or “Tomb-Sweeping” Festival in Springtime for honoring deceased family members. Families will make a picnic trip to the family tombs with food and grain alcohol offerings and sweep the graves clear of weeds. Psychologically, this reinforces family identity and a sense of continuity through the generations, even though it may require the repression of negative memories of the deceased.

Lineages are large kinship organizations whose families all trace back through the father’s descent line to a common male founding ancestor

many generations in the past, often recorded in genealogies. Many lineages have their own ancestor hall where lineage members gather to present food and alcohol offerings in rituals of ancestor sacrifice. Many of these sacrificial ceremonies still follow the basic liturgy set forth by the Neo-Confucian scholar Zhu Xi back in the twelfth century CE. Psychologically, these rituals reinforce family and kinship solidarity and identity, a sense of life after death for all, and respect for the elderly.

People who die without leaving descendants are often pitied because they will not have anyone to remember them and make offerings. When they die, they are thought to become “hungry ghosts” or “orphan ghosts” (*guhun*) who harbor resentment towards the living and to cause trouble. People who die an unnatural or unjust death, such as a grisly accident or murder, are also thought to become wandering ghosts who can cause harm to the living. Families try to appease these restless spirits with offerings, especially on the Buddhist festival of Universal Salvation (*pudu*). The aim of this festival is to help the souls of the dead who are languishing in purgatory get released. Psychologically, ghosts invoke people’s guilt about abandoning or mistreating strangers in their midst and enjoin people to treat beggars and non-kin with kindness. Ghosts teach people that all human beings deserve to be remembered.

Deity Worship

Worship of gods or goddesses forms the heart of popular religion. China has always been a polytheistic culture with innumerable deities (Fig. 1). Nature deities personify natural phenomena such as a constellation, the sun or moon, a river or mountain, or an animal, such as a dragon or tiger. Psychologically, one feels more secure and confident in praying and making offerings to them to gain their aid. Most gods were once a human being who made a great contribution to humankind or who led an exemplary selfless life helping others. Some gods are so ancient that their biographies are more like mythologies: the God of Agriculture (who receives offerings for a good harvest in the face of uncontrollable natural forces), the Western Queen Mother, and the Jade Emperor (the supreme deity). Examples of major gods or goddesses worshipped across China include Guandi, the God of War (once an admired, model righteous general); Mazu, the maritime goddess of the southern seas (who is called on to rescue drowning sailors); Long Wang, the Dragon King who helps bring rain; Wen Chang, the God of Literature who helps students on exams; and Bao Gong, the upright god who defends justice and honesty in officialdom. These are some of the prominent gods worshipped across China and the offshore Chinese communities of Taiwan, Hong Kong, Singapore and Southeast Asia. Local

Chinese Popular Religions, Fig. 1 Center: Guan Gong, A God of War, with his son Guan Ping to the right and Zhou Cang to the left. Baosheng Dadi Temple, Xiamen City, China (Photo courtesy of the author)

communities also have their lesser known local deities or tutelary gods. One prays to the gods to request help in life, to swear an oath to do good deeds, or to ask for forgiveness of sins. Worship takes the form of bowing; kowtowing on the floor; offering incense, food, and grain alcohol; and burning imitation money in deity temples.

In temple rituals, the gods are often arranged in a rough hierarchical order of differential ranks. The images of many male gods are dressed up like officials of the old imperial state, and in ritual processions, they are carried out of the temple in a palanquin with a retinue of guards and sometimes shamanistic troops. The ritual procession takes the god to inspect the boundaries of the local community he is responsible for protecting, just like imperial officials in the old days. Anthropologists have called this hierarchical arrangement of gods resembling human officials, the “celestial bureaucracy,” a unique feature of Chinese popular religion. These images not only express divine sanction for social hierarchies but also project an ideal officialdom of benevolent gods against which human officials are measured and uphold a transcendent justice that is higher than the power of human officials. Thus, corrupt local officials may escape the law with their venality, but psychologically, some may also fear the wrath of the gods.

In ritual processions in Taiwan, the surging and devout crowds, the cacophonous firecrackers, and the shamanistic trances and self-mutilations all contribute to an overpowering psychological and religious experience for believers and a grand spectacle for outside observers. In Mainland China, due to official restrictions, both actual and psychological, religious events are more sober and restrained, in keeping with the emphasis on secularism in the society.

Chinese Queen Mother of the West: Xi Wang Mu (西王母)

Minqin (敏) Wang (王)¹ and Lee W. Bailey²

¹College of Foreign Languages and International Studies, Hunan University, Changsha, China

²Department of Philosophy and Religion, Ithaca College, Ithaca, NY, USA

The Chinese Queen Mother of the West (*Xi Wang Mu*) is a very ancient goddess who was absorbed into Daoism. Her powers include the peaches of fertility and immortality, and the female Yin. She originated in the Kunlun Mountain mythology, which is the most complete and large collection

of ancient Chinese mythology. The large Kunlun Mountain Range is on the border between the Xinjian province and the northern border of Tibet. Its highest mountain is called Kunlun Goddess (*Liushu Shan*), rising 7167 m (23,514 ft). In very early Chinese mythology, this region was ruled by the *Queen Mother of the West*. The mythical region slowly moved farther west into an intangible region, as the Silk Road brought China Western curiosities such as Greek images. Her tradition is an important one of the intangible cultural heritages listed by the Chinese government (ihchina 2014).

Xi Wang Mu is also called “*Wang Mu (Queen Mother)*,” “*Jin Mu (Gold Mother)*,” “*Yao chi Lao Mu (Old Mother of the Yao Pool)*,” “*Yao Chi Jin Mu (Gold Mother of the Yao Pool)*,” “*Gui Shan Jin Mu (Gold Mother in Tortoise Mountain)*,” “*Jin Mu Yuan Jun (Gold Mother the First Lady)*,” “*Wang Mu Niangnian (Queen Mother Her Majesty)*,” “*Xian Mu*,” and so on. Her images and beliefs in different times and different Asian countries made her become a “Goddess with thousands of faces.”

Early Shamanism

The earliest record of the Mother of the West was found on oracle bone inscriptions from the fifteenth century BCE that record sacrifices to “Western Mother” (Cahill 1993). The text *Shan Hai Jing (Mountain-Sea Sutra)* appeared about the period of the Warring States (475 BCE–221 BCE). It had the earliest record of *Queen Mother of the West*, who lived in a cave of a jade Kunlun Mountain, and was a fearful creature with a human face, tiger’s teeth, a leopard’s tail, and flowing decorations on her hair. She was sometimes portrayed wearing a crown signifying an ancient tool of weaving. She sat on a shamanic stool situated on top of the mountain’s steps (like an *axis mundi*), with a cane in her hand; she was good at gathering people by whistling and had three birds called *sanqingniao* (三青鸟) that fetched food for her. When she wanted to visit someone or some place, one bird would go in

advance to be the ambassador, the other two would go together with her and on each side of her for protection. These qualities were typically shamanic. This mythic image suggests that she may have been the leader of a tribe, half-human and half-animal. This image may be the interpretation of a shamanic woman who wore symbolic tiger and leopard clothing and ornaments. Symbols on bronze sacrificial vessels associated her with a tiger. In China, tigers were western Chinese symbols since neolithic times, an agent of death, and transportation into the spirit world, before it was linked to the Queen Mother (Cahill 1993, p. 13).

The Queen Mother of the West had high authority, because she was believed to govern plague, pestilence, medicine, and heavenly punishment. In archaic times, her image as half-human and half-animal may have made it easy for her to be welcomed and supported both by humans and animals, in a worldview with thin barriers between humans and nature. Her unique image differentiated her from others, and granted her authority. This might be regarded as being given by Heaven, which became the basis for her being promoted above the image of a shamanic human. The earliest text after the oracle bones was in an early classic of nature mysticism: *Zhuang zi*, dating from perhaps the third century BCE.

Early Dynastic Relations

During the Warring States period (403–221 BCE), we find better textual sources. Several texts seem to describe different goddesses, each called *Xi Wang Mu*. They may have emerged from various social levels or local cults. Here she was described as a teacher, spirit of holy mountains, shaman, directional deity, divine weaver (creator), and star goddess (Cahill 1993, p. 13). By the end of the Warring States, these each merged into one goddess. Warring States authors elevated the Queen Mother to teacher of Emperor of Yu the Great. Since teachers were considered superior to their students, this gave *Xi Wang Mu* a great

promotion, not only to teacher of an emperor, but a leading figure in Chinese government circles. She was revered in the superior and sacred role of legitimizing imperial rule, thus blending religion and politics.

Queen Mother was involved in a text from 3 BCE in *The History of the Han*, describing wildly enthusiastic people running around barefoot in a collective trance, just before the end of the Western Han Dynasty, when a drought and widespread disorder threatened to bring down that Dynasty. They waved hemp manikins, called the wand of the Queen Mother's edict, beat drums, shouted, disrupted harvests, and passed through many kingdoms on their way to the capital city. They had festivals with singing and dancing and passed out texts reading: "The Mother tells the people that those who wear this talisman will not die." This was the first recorded Chinese messianic, millenarian movement, and was seen as a rise in Yin power (Ebrey 1996/2004, p. 73; Cahill 1993, pp. 21–22). Her political influence at court was apparently weakened by these disruptive demonstrations.

The Humanization of Xi Wang Mu

Xi Wang Mu was later widely regarded as one of the Grand Mother Goddesses, together with the creator goddess *Nǚ Wa*. The highlight of her history was during the Tang Dynasty (618–907 CE). With the development of Chinese society, *Xi Wang Mu*'s image discarded the old tiger teeth and leopard tail and changed into an elegant, graceful woman and national leader, suitable for a royal court. She was seen as queen of the land of the dead (Cahill 1993, p. 239). During the Han Dynasty (206 BCE–220 CE), she grew in importance and absorbed functions of other deities. She began to control the stars and metals and, most importantly, immortality and the yin (female) side of the yin-yang dualism of *Qi*. According to the records of *Huang Di Chu Jun Jue*, *Xuan Nǚ Zhuan*, and *Huang di Nei Zhuan*, *Xi Wang Mu* helped *Huang Di*, an ancient Emperor regarded as

the forefather of the Han tribe, to defeat his powerful enemy *Chi You*, and he united the nation. The book *Jia Yi Xin Shu*, the chapter *Xiu Zheng Yu*, recorded an incident in the life of the ancient Emperor *Yao*, who was trapped by an enemy army on a mountain called *Du Shan*, so he went to nearby *Xi Wang Mu* asking for help. Excavated from the tomb of *Wei Xiang Wang*, the book *Mu Tian Zi Zhuan*, published during the Warring States, recorded *Zhou Mu Wang*'s visit to *Xi Wang Mu* with precious gifts, such as white jade. *Xi Wang Mu* asked whether *Zhou Mu Wang* would visit her again with songs. Two other books: *Zhu Shu Ji Nian* and *Shi Ji* recorded this event. *Xi Wang Mu* began to communicate frequently with the leaders of the central continent. By about 400 CE, bronze mirrors, considered numinous and magical, appeared and some had pictures of the Queen Mother on the back. They were found in graves, with expressions of hope for immortality through the Goddess.

The Queen Mother was sometimes paired as consort with the King Father of the East (*Dong Wang Gong*), who represented the masculine force of Yang, and kept the records of the Daoist kings, while the Queen Mother of the West represented feminine Yin power (Ebrey 1996/2004, p. 72). She was depicted ruling a Kunlun Mountain paradise and riding a white crane, symbolizing long life. She was attended by girls ("Jade Maidens") and had an orchard with peaches of immortality and five fairy handmaidens whose colors represented the four points and center of the compass. The Queen and King had nine sons and 24 daughters. The most beloved of the Eight Daoist Immortals *Li Tieguai* was the first of the eight to gain immortality, becoming a student of *Xi Wang Mu*, after she healed an ulcer in his leg. He was portrayed as a lame beggar with an iron crutch and was the patron deity of herbal healers and exorcists (Perkins 1999, p. 589). The Queen Mother absorbed the powers to protect against disaster and grant children. She was increasingly associated with Daoism and Daoist monks, which had been growing since the fourth century BCE.

The Immortalization of Xi Wang Mu

The enthusiastic pursuit of longevity by the Qin Emperor *Qin Shi Huang* and Han *Wu Di* made immortalization very popular, so *Xi Wang Mu* gained another function. She could grant immortality to worthy persons and refuse it to others, including emperors. She could take and give life and babies to people. In the book *Huai Nan Zi*, the chapter *Lan Ming Xun* reported that *Hou Yi* requested from *Xi Wang Mu* the elixir of immortality, but his wife *Chang E* ate it and became so light that she flew up to the moon and became immortal there. The book *Jiao shi Yi Lin* recorded that *Ji* (the agricultural official of Emperor *Yao*) visited *Xi Wang Mu* and requesting good children. Also *Han Wu Di* asked for medicine from her. The theme of flying on dragons, clouds, horses, or cranes in visions and poetry became widespread.

The Official Beliefs of the Daoist Xi Wang Mu

During the natural disasters at the end of Western Han Dynasty (202 BCE–9 CE), suffering people turned to *Xi Wang Mu* for help. In the book *Han Shu*, the chapter *Yuan Hou Zhuan* recorded that the Han Emperor *Wang Mang* (45 BCE–23 CE) gave orders to pray to *Xi Wang Mu*, which made belief in her official since then.

Daoism is an ancient Chinese mystical religion that emphasizes the *Dao* (the Way) as the source and substance of all existence. Its temples often center in a large garden and emphasize harmony with nature, by contrast with the more humanistic Confucian social order and ritual. The Queen Mother of the West was active in the Tang Dynasty, teaching Daoist religion and patronized by the Imperial state.

The Daoist image of *Xi Wang Mu* was widely acknowledged during the time of the Wei Jin Nan Bei Dynasty (222 CE–589 CE). *Han Wu Gu Shi* depicted *Xi Wang Mu*'s descent from Heaven to the Han Court of *Han Wu Di*, who requested the longevity medicine from her. He was granted five

peaches, but he was eventually refused the magic of immortality, because he later indulged in human passions and killed some Daoist monks. So *Xi Wang Mu* cut off her relationship with him. Up through the medieval Tang Dynasty (618 CE–907 CE), *Xi Wang Mu* possessed the highest Yin power and was the leader of all Goddesses and the teacher who taught Daoist sutras to the pious and high-level practitioners.

The Secularized Image of Xi Wang Mu

After the Western Jin Dynasty (265–316), *Xi Wang Mu* descended from her altar and became more human, because for the first time she had human names such as in the books *Ji Xian Zhuan* and *You Yang Za Zu*, and she even had family members in many stories, such as in *Sou Shen Hou Ji* (Vol. 5). *Xi Wang Mu*'s compassion was shown by adopting 3-year-old girl *Du Lan Xiang* to grow up on Kunlun Mountain, after her family was drowned in Green Grass Lake. Some fruits and other things were named after *Xi Wang Mu*, such as Wang Mu peach, Wang Mu red dates, Wang Mu mat, Wang Mu bird, and so on.

In folk belief the Queen Mother of the West looked neither so grave and gracious, like Shakyamuna in Buddhism, nor so indifferent and remote as the Daoist San Qing. Rather, like a mother, she shared her benevolence and compassion, which brought her love and spirituality closer to the common people (Fig. 1). In the *Declarations of the Realized Ones*, she headed up a matrilineal clan with religious figures traced through the maternal family line. This was quite a contrast with the traditional Chinese patriarchal clan lines (Cahill 1993, p. 34).

The Queen Mother urged Daoist spiritual practices on students, including emperors, such as meditation, visions, “pacing the void,” compassion, moral behavior, to nurture the “immortal embryo” inside. She was said to be present in one's right eye, and a spiritual name was “Mysterious Radiance.” Her cult contrasted with Buddhism, which entered China in the first century

Chinese Queen Mother of the West: Xi Wang Mu (西王母), Fig. 1 Xi Wang Mu on Chinese Porcelain vase. Qing Dynasty, Kangxi period. 1662-1722. Musée Guimet, Paris. Photo by Vassil. Wikipedia, "Xi Wang Mu." CE. This challenged the Daoists to clarify and organize their teachings and define their deities. But she shared some beliefs with the Buddhists, such as compassion and individual salvation (immortality). In her compassion, she was also similar to the popular Chinese Buddhist-syncretic goddess Guan Yin.

The goal of her teaching was to transform the consciousness of her adepts into "transcendence," rising above this world into the immortal realm of visionary flights (Cahill 1993, pp. 205, 208). A repeated theme is her visiting the palace, teaching the Emperor the spiritual principles of Daoism, including studying numinous texts, moral behavior, meditation, and seeking the transforming realization of the *Dao*. But later the

Emperor would slip back into his crude old earthly ways and utterly lose his chance for immortality (Cahill 1993, pp. 155, 162, 171).

She would also host grand feasts at her Kunlun Mountain palace for the elite, linking heaven and earth, immortality and humanity. This was poetically expressed as a "visit to the palace Turquoise Pool" to overcome earthly concerns (Cahill 1993, p. 239). They celebrated with dance and music. Celibacy was practiced among monks and nuns who vowed to seek transcendence and seek the *Dao*. Others cultivated passion in courtly romantic affairs (as with "Jade Maidens"), concubines, and marriages. The Goddess was a divine matchmaker. Daoist priestesses and layman had love affairs that came under her protection. Monastic celibacy was preferred for Tang Daoist adepts, but the strong human instinct for love and family did not disappear in the Goddess's Daoism. Along with monastic celibacy, romantic passion and motherhood were all seen as valid ways to approach the mystical, ecstatic consciousness of realization of transcendence of death and love (Cahill 1993, pp. 231, 242).

The language of the Queen Mother's texts was a richly florid poetry, in the style of Daoists and imperial officials. The description of her walled mountaintop palace used ornate language such as "Mysterious Orchard Audience Hall," "flowing crystal," "halls of cyan and jade," "apartments of rose-gem efflorescence," "purple iridescent cinnamon chambers," and radiant "vermillion auroral clouds" (Cahill 1993, p. 37). Symbolic mythic figures flew about among the clouds, such as dragons, tigers, cranes, and adepts on visionary journeys toward heaven. Wine and secret alchemical elixirs were integral to this society. "Rain," "smashing the gourd," and "playing the syrinx flute" were typical poetic metaphors for sexual activities. It was said that:

If the lovers eat both divine peaches and alchemical elixirs, the rock crystal curtains of their bedroom will transform themselves into the jade staircase of the transcendents' palace, and their bedroom will become a microcosmic heaven on earth. (Cahill 1993, pp. 234, 238, 245)

Mystical alchemical elixirs were meant to bestow enchanted flights to the eternal

transcendent Dao, longevity, and immortality; they were cooked in special bronze ovens. Sacred peach mush was mixed with various other magical ingredients, such as jade, that had been buried in graves since neolithic times. Lapis lazuli, with its flecks of gold pyrite, stood for the night sky and its stars. Alchemy had secret mystical meanings and included various ingredients such as divine fungi, rhinoceros horn (for fertility), sulfur, lead, arsenic, gold, and cinnabar (for eternal life), the red ore of mercury (quicksilver-yin), that they may not have known was toxic, even though some alchemists became a bit mentally erratic. The first known Chinese alchemist was the woman Fang, in the first century CE. She refused to tell her husband alchemical secrets, so he abused her. She also ingested so many toxic ingredients that she went mad and died (Rayner-Canham and Rayner-Canham 2001, pp. 4–5). Like Western medieval alchemy, a major goal was to transform base substances, such as lead (signifying melancholy) into gold (indicating soul treasures, like wisdom). These all had deep psychological and spiritual significance. The Daoists thought that it was all divinely passionate and transcendent (Cahill 1993, pp. 74, 184). Later (1940s, 1950s) the Swiss archetypal psychologist Carl G. Jung introduced the important concept of “inner alchemy” and counteracted the modern scientific view of alchemy as superstitious chemistry with a deep, mystical, paradoxical psychology. It was similar to the Goddess Mother’s Daoist teachings on transcendence and alchemical secrets, such as elixirs being symbolic of psyche and spirit, and union of opposites [*cuniunctio oppositorum*], as in Yin-Yang philosophy (Jung 2009, *Red Book and Collected Works*, Vols. 12, 13, 14).

The beautiful and gracious Queen Goddess’s most important roles were creation, psychologically and socially balancing Yin and Yang, preparing adepts for the afterlife, teaching and cultivating the *Dao*, growing and guarding the peaches of immortality, and dispensing some to those worthy seekers who had attained the transcendent *Dao*, and thus immortality. She was a nurturing mother and supreme ancestress of all.

She provided both a grand model for women in a patriarchal society and a psychological image (*anima*) for men of an ideal mother, lover, and teacher. She especially protected women of all kinds, rich or poor, despised and respectable, lay or religious, especially those outside the family circle, such as nuns, widows, hermits, artists, and prostitutes. The opportunity for an education was a major attraction for many women to become nuns (Cahill 1993, pp. 214, 216).

The Goddess’s palace on Kunlun Mountain was surrounded by a golden rampart and a magic Turquoise fountain, where the feast of the immortals was regularly held at the edge of the Lake of Gems for the Queen Mother’s birthday. The meats included bear paws, monkey lips, and dragon livers. The culmination of the feast was serving the peaches of immortality, to continue her guests’ immortality. The magic peach tree took 3,000 years to blossom and another 3,000 years to ripen (Christie 1968, pp. 78–79). Belief in immortality is an important religious way to give meaning to life and overcome the natural fear of death. The Queen Mother shared this concern with Daoists.

Later, in the middle of Ming Dynasty (1368 CE–1644 CE) and Qing Dynasty (1644 CE–1912 CE), the spread of *Xi Wang Mu* mainly depended on *Bao Juan*, a speech and singing script combining belief, education and amusement, and *Nian Juan*, group singing and narration for great events, such as funerals, or in leisure time. The belief in *Xi Wang Mu* has spread to Taiwan and many places of Eastern south Asia.

Psychologically, the mythic image of *Xi Wang Mu* provides a strong Queen and Yin feminine figure, lover, mother, teacher, and creator-goddess who balances Yin and Yang. Religiously, she teaches paths to transcendence, such as celibacy, alchemical elixirs, sexual passion, meditation, visions, and morality. She represents the soul’s important coming to terms with death (the way of the western setting sun), symbolized by her garden of the peaches of immortality and her decision about who, having sought transcendence and the *Dao*, is worthy of this gift (Fig. 2).

³University of Hong Kong, Hong Kong Special Administrative Region of the People's Republic of China, Hong Kong, People's Republic of China

According to the International Religious Freedom Report (2005), 8% of the population in Mainland China claimed to be Buddhists, and another 20–28% of the population practiced traditional folk religions. The latter include worship of local gods, heroes, and ancestors and often present as loose affiliates of Taoism, Buddhism, or cultural practices of ethnic minorities. In Taiwan, 35% of the population claimed to be Buddhists, 33% Taoists, and 4% believers in *Tiende Jiao* and other traditional folk religions. However, the 2006 *World Fact Book* indicated that 93% of the Taiwan population could be followers of a hybrid of Buddhism, Confucianism, and Taoism. Distinct religious classification may be difficult.

A substantial portion of Chinese people claim that they do not believe in any religion. Data showed that 59% of the population in Mainland China are nonreligious (Johnstone 1993). Some 8–14% called themselves atheists (Barrett et al. 2001; O'Brien and Palmer 1993). The 2001 *World Value Survey* showed that 55% are nonreligious and 24% are convinced atheists. More recent investigations show that religions are thriving in the state ruled under atheist communism (Yang 2012). In Taiwan, 12–24% of the population call themselves atheists (Inglehart et al. 2004). In another study conducted in Taiwan, 43% of the respondents labeled themselves as not believing in any religion (Chou and Chen 2005). The statistics presented above paint a confusing yet true picture that it is difficult to arrive at clear distinction among religions in Chinese culture.

Taoism

Taoism could mean the Taoist school of philosophy as well as the Taoist religion. Tao (or *Dao*) means “way,” everlasting and yet ever changing. Chuang Tzu believed that the world is in peace and harmony in the original state. Disorders arise because of human intending to manipulate and mistakenly dichotomize the world and our understandings of it. The only solution is to acknowledge the limitation and relativity of dichotomized views and to embrace them all. Based on the philosophy of Lao Tzu and Chuang Tzu, Taoism emerged in the second century, being propagated as *Tianshi Dao* or *Wudoumi Dao* (Celestial Masters) and *Taiping Dao* (Great Peace). Much of its philosophy, values, and religious practices could be traced to its sacred text *Tao Te Ching*. However, as Lai (2003) noted, scholars on Taoism are still debating on what actually constitute the religion.

Certain concepts attributed to Taoism have found favor among some psychologists, especially those with a humanistic persuasion. They include the following:

1. *Qi* or ch'i. According to Taoist belief, *qi* (energy) runs in every individual. Such *qi* is connectable to the energy of the universe. Davis (2004) applied this belief to organizational psychology and posited that leadership energy similarly flows through the social network of an organization. Empirical evidence for *qi* is, however, lacking.
2. Yin and yang. The universe, as well as each individual person, is a reflection of the balance of two principles or natures, the *yin* (negative, darkness, weakness) and the *yang* (positive, light, strength). Health is when a person experiences a balance (or homeostasis) of the *yin* and the *yang*. According to Taoism, too much of one thing, however good in its own right, can be dysfunctional. It remains an empirical question how much is too much.
3. Taoism advocates being *wu wei*, which is effortless, spontaneous nonintervention in handling the external world. It entails the return to quiescence and harmony with nature. *Wu wei* is the way to achieve absolute happiness, a high

level of mental health (Yip 2004). A leader exercising *wu wei* is, however, like adopting a less effective, laissez-faire style of leadership (Bass 1985).

4. Intuition. In Taoist conceptualization, true understanding (*Dao*) cannot be named but can only be experienced and understood through meditation and intuitive awareness. Intuition is knowing through personal and subjective experience, in contrast with the objective scientific method. Instead of being a cognitive process, intuition is spontaneous. It attends to the presence (Olson 2002). According to Taoism, in spite of its elusive nature, intuition can be nurtured through experiential learning and formal education, like what clinicians have done to develop their clinical intuition.
5. Mindfulness. In Taoism, being mindful is when a person is fully involved in the present moment and focused on what is being done, rather than worrying about the outcome. This process enhances the wisdom of the person, by freeing the person from worries about the past or future, to perceive and understand oneself and others more accurately. This person can then readily attain peace and be able to work interdependently with others. The concept of mindfulness is also found in Buddhism.

In Taoism, a person is an integrated whole, embracing physical, emotional, social, and spiritual aspects. Illness and suffering result from the disconnection of the person from himself/herself, others, nature, and the universe. That is why it is important for a Taoist to enhance the harmony between yin and yang and get in touch with the inner self. Through meditation, Taoism develops one's self-awareness and intuition, bringing about "an emotionally and spiritually balanced individual who relates harmoniously with others and with nature" (Olson 2002, p. 161). In other words, this religion contributes to personality development and helps people attain humility, simplicity, genuineness, flexibility, adaptability, spontaneity, persistence, and acceptance (Olson 2002).

Learning Taoism may have positive impact on subjective well-being among senior citizens in

China (Zhou et al. 2002). Taoist philosophy has been incorporated into some cognitive psychotherapy to help college students high on neuroticism and patients with generalized anxiety disorder. The technique may improve coping and reduce neurotic symptoms. However, more empirical evidence on its effectiveness is needed (Huang et al. 2001; Zhang et al. 2002).

Confucianism

In the midst of civil struggles, Chinese people in the suffering slowly turned away from their gods and spirits to focus on the problems confronting human society and governance. This is the *zeitgeist* in which Confucius (551–479 BCE) lived. Aiming at restoring just rule and legitimate government of the early Zhou dynasty, Confucius advocated a new form of education and expounded ethical principles. He described *ren*, the "way" of the perfect man. Avoiding the subjects of the supernatural and afterlife, Confucius would rather "revere deities and ancestral spirits, but keep them at a distance." His concern was on the earthly, human situation in the world. Thus, some people consider Confucianism more a philosophy than a religion.

The influence of Confucianism diminished after the third century and the emergence of Buddhism. It was only until the eleventh century, by the effort of thinkers like Zhu Xi and Wang Yang Ming, influenced by Buddhist theories of mind and enlightenment, that Confucianism revived, consolidated, and reclaimed its status among the Chinese elite. Despite the interest in spiritual elements such as self-awareness and meditation, the original goal towards establishing order within society remained unchanged in neo-Confucianism (Overmyer 2002).

Behavior with other people is regulated in accordance with the "ethical system of benevolence-righteousness propriety (*ren-yi-li*)" (Hwang 2001). *Ren* is showing affection to all humankind. *Yi* is respecting others. *Li* is treating others according to their status and roles. Confucianism has a strong faith in people's own ability and power in attaining perfection. According to Ho's analysis (1994), it is the root of parents' authoritarian moralism and

cognitive conservatism, as well as children's high rigidity and low cognitive complexity. Nevertheless, it is also the basis of many Chinese people's high achievement motivation.

Buddhism

Buddhism took root in ancient India in the sixth and fifth century BCE and arrived in China in the second century BCE. Buddhism and traditional Chinese thoughts were at odd with each other in the beginning. However, Buddhism had an appeal to both the ordinary people and the intellectuals, because of its simple religious practice, sophisticated philosophy, promise of life after death, as well as a range of religious and social advantages such as full-time religious vocation in an institution independent of family and state (Overmyer 2002). Buddhism underwent much "sinicization," incorporating some Taoist and Confucian concepts.

Buddhism has much to say about human motivation and emotion. For example, *sukha* is an enduring trait that arises from an equilibrium in mental state and awareness of the true nature of reality. It can be likened to happiness. Achieved through sustained training in attention, emotional balance, and mindfulness, it results in changes in mood and even changes in temperament (Ekman et al. 2005). According to Buddhism, some mental states (such as craving and hatred) are afflictive regardless of their level or context in which they occur (Ekman et al. 2005). This view is different from the prevalent psychological perspective that emotions are adaptive (Cosmides and Tobby 2008; Ekman et al. 2005).

Psychological well-being (e.g., happiness, peacefulness, personal growth, and self-reflective insights) seems to improve among participants in Buddhist retreats (e.g., Page et al. 1997). Tori and Bilmes (2002) observed a positive correlation of Buddhist beliefs with reaction formation and a negative correlation with regressive emotionality and projection. They found that in Thailand, Buddhist monks' defense mechanism (unconscious coping) was low in regressive emotionality and high in denial, reaction formation, and repression when compared with a local sample.

Ancestor Worship, Folk Religions, and Animism

Chinese people worship natural objects (e.g., trees, thunder), heroic personalities (e.g., *Guandi*), and even one's own deceased relatives. Many religious activities such as ancestor worship are based on a belief in afterlife (Overmyer 2002). That is why in burial grounds for important people as early as the Shang dynasty, extravagant burial offerings including "decapitated human beings, horses, dogs, large numbers of bronze vessels, and objects of jade, stone, and shell" (Overmyer 2002, p. 258) can be found. To contact the deities, people engaged in sacrificial rituals. Sacrifices were made alongside requests for some benefits in return. According to Overmyer, this principle of reciprocity is the prevalent pattern of human-deity interaction throughout the history of Chinese religions.

A fear of the unknown and an inability to master nature are probably some psychological roots of this line of religious beliefs and practice. Inscriptions on oracle bones and bronze sacrificial vessels show how ancient Chinese asked for help or favor from their ancestors. It was believed that the longer ones had been dead the more powerful were their spirits. The deified ancestors are like the "intermediaries between their living descendants and the more powerful gods of natural force" (Overmyer 2002, p. 258). Since they can bring harm or aids to them, it was "necessary to propitiate the ancestors to ward off their anger as well as to bring their blessing" (Overmyer 2002, p. 258). Besides this desire to gain and to avoid curse, there may also be a Taoist-based desire to become *xian*, namely, deities. In addition, the Confucian doctrine of filial piety provides the ethical basis of ancestor worship. Ancestor worship is practiced not only to comfort the dead and to make them harmless; it also reflects the "authority on the part of the parents and filial piety on the part of the son" (Hsu 1948, p. 276). The practice extends and strengthens the impact of ancestor in shaping the descendants' personality as well as their lives.

Conclusion

The four religious traditions differ in terms of how the “self” is treated. The self is the ultimate goal being served by ancestor worship and animistic practices. In the Confucian tradition, people are viewed as embedded in a social network, with the family as the most important environment for personal development. The self is thus defined in terms of membership in a collective. In the Taoist tradition, the self is “but one of the countless manifestations of the Tao and . . . an extension of the cosmos” (Ho 1995, p. 120). The ideal self is, paradoxically, selflessness. In the Buddhist tradition, construction of self is rejected while “owning” one’s self is an illusion and the source of suffering (Ho 1995, p. 121). To Ho (1995), the commonality among the three religions is about psychological decentering. While the reciprocity principle in Confucianism masks the differentiation between the self and others, the selfless person advocated by Taoism embraces the dichotomy between self and others. The abandonment of selfhood in Buddhist tradition essentially puts the self and craving to death.

Historically and at a doctrinal level, Confucianism, Taoism, Buddhism, and animistic folk religions have distinct worldviews and belief systems. However, as these religions evolved over the years, being formed and modified by the sociohistorical contexts, there were competition as well as amalgamation among them. For example, the cosmology in the classic Confucian text *Diagram of the Supreme Ultimate (Taiji tushuo)* has incorporated Taoist description of genesis of the cosmos. Likewise, the neo-Confucian’s ideas of self-consciousness, innate knowing, and meditation did not originate from Confucius or Mencius (another leader of Confucianism) but are rooted in the Buddhist philosophy and Taoist practice. Conversely, Taoism has adopted from Confucianism social ethics (such as loyalty, filial piety, and social responsibility towards the society) into its religious practice and linked them to the Taoist philosophy of immortality. These adoption and fusion have been done by each religion to refine and supplement their own doctrinal systems.

At a practical level, Chinese people do not make clear distinctions among various religions. Chinese people worship deities and honor sages from more than one religion at the same time. It is therefore not surprising to find someone who claims to be a Buddhist to practice Taoist rituals and a Confucian offering incense to a *xian*. Hui et al. (1989) found in a factor analysis of beliefs about death that the Buddhist view and the Taoist view congregate in the same factor. Regardless of the kind of religion one holds, it has impact on the way one interprets the world. Yip (2003) reported that Chinese religious beliefs affect the contents, manifestation, and meaningfulness of delusion and hallucination of Hong Kong schizophrenic patients. Such influence on subjective psychotic experience would in turn affect one’s cognition and behavior (Yip 2003).

Chinese Shooting Suns

Minqin (敏琴) Wang (王)¹ and Lee W. Bailey²

¹College of Foreign Languages and International Studies, Hunan University, Changsha, China

²Department of Philosophy and Religion, Ithaca College, Ithaca, NY, USA

There are two versions of myths of Chinese shooting suns, one is Da Yi she ri (大羿射日) and the other is Hou Yi she ri (后羿射日). The powerful and heroic heavenly beings in these legends, who shaped the early creation, were divinities.

Version One

According to the book *Shan Hai Jing·Da Huang Nan Jing*, beyond the East and South Sea, up to the Gan River, a woman named Xihe (羲和) took bath in the Gan River every day. She was so beautiful and graceful that the Heavenly Emperor Jun (帝俊), when he travelled there, fell in love with her at the first sight. Since their marriage, the Heavenly Emperor Jun no longer felt lonely, so he travelled less. Soon they gave birth to ten suns. They had a more happy life there. There was a big tree called Fusang (扶桑) in the nearby valley, whose diameter was 4,500 m. After bathing the ten suns every day, Xihe would put nine suns on the lower branches of the tree and one on the top.

The ten suns were taught by the mother to go up to the sky to serve earnestly by turns; when one sun, carried by a crow with three feet, arrived at the tree, another one would leave. Everything went smoothly like this for a long time, and people lived a hard but happy life. Many years passed. One day, the ten suns felt it was too boring and lonely to serve alone each time and decided to fly to the sky together for fun, but since they often did this, they brought too much chaos to the world. Trees and plants were burned, rivers dried up, people had nothing to eat and drink, and all kinds of animals came out from the forests to eat people.

At first, the Heavenly Emperor Jun was very surprised to see these disasters. He thought that he must have done something wrong that caused these disasters, so he reflected and even punished himself. After these, he found that the situation had not changed. Then he began to do an investigation. In his meditation, he: the Heavenly Emperor Jun found that all these problems were caused by his ten suns, and their mother was not with them since they were old enough to work alone. He was very angry, but he could not bear to kill them himself. According to the book *Shan Hai Jing • Hai Nei Jing*, he ordered his official Yi, who was good at shooting, to go down to the human world to help common people and gave Yi a red bow and white arrows to represent his authority. So when Yi came down from the Heaven to help the human world, he was appointed as a shooting master by the human Emperor Yao (帝尧), and Yi happily married the previous Emperor Ku's (帝嚳) daughter Chang E (嫦娥). He did not know that Chang E was the reincarnation of Xihe, who came to the human world earlier to help people. Yi did not get lost in the marriage and happy life but instead strengthened his will to get rid of those harmful things for people. So he made up his mind to say farewell to his newly married wife and start on his journey to conquer troubles.

The first thing Yi had to do was to shoot the suns. But it was not an easy job. This was because he knew that the suns were born during the early formative time of the Heaven and Earth, and their parents were called Fuxi and Nüwa in the human world, so they were very, very powerful. When they

were happy, the suns would eject water from their mouths, drowning the fields and roadways, causing floods; when they were angry, they would eject fire from their mouths, burning everything. No one dared to challenge them. They were very surprised and then very excited when they knew that Yi wanted to fight with them. At first, they did not pay any attention to Yi, because they did not know the red bow and white arrows that Yi used were given by their father, that increased Yi's power. After Yi shot down three brothers, they began to feel nervous; they ejected water and fire at the same time, forming a network, which prevented Yi from going forward. Yi tried hard to avoid the water and fire, seizing every chance to shoot; finally nine suns had been shot down, and the remaining one ran away. So it became completely dark and people could not see at all; then Yi decided not to shoot the remaining sun and let him serve people. Since then, the sun moves regularly, and the climate is now proper for everything.

Yi's story was written in *Huai Nan Zi • Ben Jing Xun* (《淮南子 • 本经训》). Here, besides shooting down nine suns on the river, Yi was ordered by Yao to kill many harmful animals. First was Zaochi, in the wilderness of Chouhua, a kind of animal whose teeth were so sharp that he could bite hard stone like a chisel. Second was to defeat the great wind in the marsh of Qingqiu. Third was to kill Yayu, who was originally a heavenly god with a human face and a snake's body. But after Yayu was murdered and came back to life by a magical power, he lost his natural form and fell down into the Ruo River at the foot of Kunlun Mountain. There Yayu became a horrible monster with a human face, a snake's body covered by long red hair, and horse's feet. When he shouted, he sounded like a baby crying. When the ten suns made the water in the Ruo River boil so much that Yayu could not bear it, he jumped out of the river and ate many humans and animals, so that people were very afraid of him. Yi's fourth task was to cut up the long snake in Dongting Lake, and fifth was to capture Fengxi, a wild pig in Sang forest. Then people were very happy.

Finishing his tasks in the human world, Yi took his wife Chang E back to Heaven. Yi's achievement was praised by the Heavenly Emperor Jun,

but this aroused some people's envy. The most important was that the Heavenly Emperor Jun recognized at once that Chang E was his former wife Xihe; he worried if the couple stayed a little longer in the Heaven, the familiar environment would soon make Chang E remember who she really was, which would bring trouble to the three and increase their pain. So, using the excuse of believing the envious scandal, the Heavenly Emperor Jun restrained his own emotional sufferings and firmly banished Yi and his wife Chang E to the human world forever. Yi felt very sorry for this, so he begged the Goddess Xi Wang Mu for the long-life medicine. At first, Xi Wang Mu did not agree, but when she learned of his deeds, especially when she saw Chang E, whom Xi Wang Mu recognized at first sight, she was very happy to give the medicine to him, expecting Chang E, the former Xihe, to come back to Heaven soon. Yi asked his wife to keep it because he had to go out hunting every day with his disciple Fengmeng. He taught Fengmeng very patiently, telling him all his shooting skills, and Fengmeng became a sharp shooter next to Yi. The idea of being the number one shooter always appeared in Fengmeng's mind.

One day when Yi went out hunting, Fengmeng found an excuse not to go hunting with him and came to Yi's and Chang E's house and forced frightened Chang E to take out the long-life medicine. Alarmed, Chang E swallowed down the medicine and her body became so light that she flew up to the moon. But it was so cold there that beautiful Chang E became a toad. Fengmeng was so scared that he hid on his teacher's path back home, where his desire to become the number one shooter made him assault his teacher with a stick made from a peach tree branch. After death, Yi was apotheosized as the God Zongbu, the leader of ghosts, and that's why ghosts were said to be afraid of peach trees.

People called this hero Yi Da Yi, meaning Great Yi, so his story of shooting the suns is called Da Yi she ri (大羿射日).

Version Two

Many people, even many scholars, confused Da Yi in the very Chinese ancient myth with

Hou (latter)Yi, a tribe leader in the Xia Dynasty, around 2000 BCE.

According to the records in the book *Zuo Zhuan·Xiang Gong Si Nian* (《左传·襄公四年》), Relying on his skill of shooting, Hou Yi was welcomed by the people of Xia and so he replaced their king. Later he did not work for people but indulged in negotiating with animals, expelled upright officials, trusted the flattering Hanzhuo. These errors led to his own death by the manipulative Hanzhou, who cooked his corpse and served it to Yi's son. But his son refused to eat the soup and was killed by Hanzhuo, who had taken Yi's wife. Here we can see no heroic deeds by Hou Yi at all.

Different Interpretations of Shooting Suns

Some scholars interpreted shooting suns by Hou Yi as the fights among different tribes, who had the same blood origin and worshipped the sun and birds, which might be identical with some historical events in Xia Dynasty.

Some interpreted shooting suns by Da Yi as a reform of calendar system, because the action of Yi's shooting was regarded as an action of measuring the sun. The arrow in ancient Chinese was written as “矢,” besides meaning arrow, it also means measuring and making something upright. A round shape was called “规(gui),” which means compasses, or drawing a circle with compasses. A square shape is called “矩(ju),” referring to a carpenter's square; “guiju” together indicates rules and principles. In ancient portraits, these tools were usually held in the hands of Chinese first ancestors Fuxi and Nüwa, meaning they were measuring and planning the Heaven and Earth, so “guiju” were the apparatus of measuring, hence arrow, the left part of “矩(ju)” also means measuring (see Fig. 1, which shows a gui [compass] in Nüwa's hand and a ju [carpenter's square] in Fuxi's hand).

All these shows that images of shooting arrows were connected with measuring sun movements, so shooting suns can be regarded as a reform of a calendar system. This would have been seen as a cosmic, thus a divine decision.

The Conscious and Unconscious in the Blending

It's a pity that nowadays most Chinese only know the wrong saying of "Hou Yi she ri" and do not know the correct saying of "Da Yi she ri" because of the confusion about the hero who shot the suns. Why were the two confused by later generations? Simply because they shared one skill, being good at shooting. It was Qu Yuan (340 BCE-278 BCE), the famous poet and politics in the Warring States Period, who played a key role in the confusion. In his long poem "Tian Wen (天问)," Qu Yuan asked a series of questions about the phenomena of Heaven and Earth, the natural and human world. The text started with the separation of Heaven and Earth, the change of yin and yang, cosmology, up to mythology, legends, saints, wars, and historical events of rising and declining of the dynasties, revealing Qu Yuan's exploration of cosmic truths. In this poem, Qu Yuan put the heroic deeds of Da Yi into the story of Hou Yi, thereby completely mixing up the two. People did not know whether he did it on purpose or not, but it was too much an obvious mistake, so Wang Yi (王逸) during the East Han Dynasty (25-220 CE) tried very hard to separate them in his interpretation of "Tian Wen"; but his effort was in vain. Qu Yuan's mistake stimulated many literary texts,

which in turn helped to spread the mistake further.

I think Qu Yuan did this on purpose, because it reflected Qu Yuan's conscious and unconscious wishes, which he could not express in words. We know both Da Yi and Hou Yi were good at shooting, suggesting that they were capable. Da Yi was trusted by both the Heavenly Emperor Jun and Human Emperor Yao, who was loyal to them, but Da Yi was expelled by the Heavenly Emperor Jun to the human world forever because of the envious scandal from his colleagues. Qu Yuan's personal experience was very similar to Da Yi's. Qu Yuan was a patriot poet, who was a high official in the state of Chu, in charge of the internal administration and foreign affairs. He insisted that they should make laws clear and should select and employ capable persons at home and should make an alliance with the state of Qi to resist the state of Qin.

Qu Yuan's suggestions for reform were not accepted by his king, and he was expelled to the area of Yuan and Xiang. Disappointed and distressed, Qu Yuan tied a large stone to himself and plunged into the Miluo River near Changsha. In order to save him, the legend goes, people took out a boat and threw rice wrapped with a kind of leaves (called Zongzi) into the river so that fish and other animals in the river would not eat him. Now we have the festival of eating Zongzi and the

dragon boat competition on May 5, according to the Lunar Calendar, to memorialize Qu Yuan. We can see that consciously he compared himself to Da Yi. The most important thing Qu Yuan admired was that Da Yi was given the authority symbolized by the red bow and white arrows to reform. Da Yi succeeded, although he was murdered by his disciple in the end, so he had nothing to regret.

Things were different with Qu Yuan. He had great ambition and capability but no support from the king. Unconsciously he wished that he could be like Hou Yi, who was trusted by the common people of Xia and pushed to replace the king of Xia to do reforms for the people and the country. But consciously this was against Qu Yuan's morality, because he was a high official who must be loyal to the king all of his life. So Qu Yuan put Da Yi's deeds onto Hou Yi, consciously indicating that he wished the latter kings could learn a lesson from Hou Yi's life experiences, that was no matter how great you were and how many contributions you have done in the early life, you must cautiously continue to work diligently for the public in late life, otherwise you would have a bad end.

The Significance of the Union of Yin and Yang

The first union of yin and yang was represented by the happy marriage of Xihe and the Heavenly Emperor Jun, who were regarded as the Old Yin and Old Yang. Before meeting Xihe, the Heavenly Emperor Jun kept travelling around without stopping. But after the marriage, the Heavenly Emperor Jun did not feel lonely anymore, he became peaceful and stable, so they could give birth to ten suns. This led to the production of the sun, the moon, stars, and everything on the Earth by the union of yin and yang, indicating the psychological and religious Daoist saying that "Nothing can grow from single yin or single yang." In the human world, they were a couple called Fuxi and Nüwa, who were regarded as the first human ancestors, because there was a myth about Nüwa's making of human beings out of mud, according to her own image.

The second union of yin and yang was represented by the happy marriage of Da Yi and Chang E. They represented the Young Yin and Young Yang and later generations in the human world. The sending of Da Yi to the human world to shoot suns and killing harmful animals suggested that the Heavenly divinities cared for the Earth, so Earth was the center of the universe in this sense.

The third union of yin and yang was represented by Chang E's flying up to the moon. Since Chang E was the reincarnation of Xihe, her flying up to the moon indicated that the Heaven needed the Old Yin, otherwise, the universe would lose its balance.

The Sun-Son Linguistic Clue

From the myth, we know that the tree on which the ten suns stay is called Fusang, or Sang, pronounced as [saŋ] in Chinese, very much similar to the English pronunciation of the two words "sun" and "son." Because Xihe was the wife of the Heavenly Emperor Jun, and she gave birth to ten suns, the ten suns in Chinese were also their sons, and they all connected with the Sang tree. So the pronunciation of the tree maybe was used to refer to the "sun" and "son" connection, and so that's why they have the same pronunciation. In the collective unconscious, it seems that since sons have traditionally been highly prized children in China, who continue the family name, perhaps they are linguistically being equated with brightly shining lights. This suggests a possible patriarchal connection between the dazzling cosmic power of the sun and the importance of family lines in Chinese and other cultural traditions. Interestingly, the two words in Chinese have the same pronunciation in some dialects even nowadays, for example, in Hanshou, a county in Hunan province, China.

Christ

Sharn Waldron
Bungay/Suffolk, UK

Christ as the Ideal Individual

Psychologically speaking Christ is not only the ideal individual but he is also the representative individual. The life of the evolving human being is lived in archetypal patterns, consciously or unconsciously. Christ's life is human life, and true wholeness is genuine Selfhood, which involves the recognition that this reality is one's

own reality. Thus, by curious paradox, it is precisely in respect of those features that give Christ his uniqueness (his dual nature) that his essential identification with all humanity is all-important.

If Jesus had been seen only as a historical figure and his humanity had been regarded as the whole truth about him, then it is likely that his present effect would be no greater than Socrates or Plato. It is precisely because he was regarded or recognized and responded to as being God himself, and therefore beyond the reality of the historical, that his life takes on the quality of revelation. This recognition or response was shaped by the "consensus of unconscious expectation" and continues into the present because of the perseverance of this same unconscious in the contemporary Western world.

Therefore, when Carl Jung speaks of the life of Christ, he is concerned primarily with that life as interpreted by some other person or group of persons. Jung ranges widely in his quotations about Christ and is prepared to establish the psychic facts of his life from the New Testament, from the early Church Fathers, from later exponents of orthodoxy, from the mystical traditions, from medieval alchemists, and from dream experiences of contemporary men and women.

There is a miraculous element in Christ's birth, the account of the annunciation, Jesus' conception by the Holy Spirit, and the virginity of Mary. This miraculous element corresponds to the "non-empirical" genesis of the Self. Since the Self is a transcendent reality that encompasses the essentially unknown realm of the unconscious, it cannot by its very nature be known in empirical ways. Both the birth of Christ and the rise of the Self from the collective unconscious come upon one unaware. They are unexpected and surprise happenings, much like Jung's experience of the underground chamber and the vision of God's enormous turd shattering the cathedral.

The Bearer of Light

In spite of the extraordinary elements, the birth of Christ was an obscure and insignificant event by ordinary standards. He was born without the basic

comforts and security of a home. He was born to parents who were powerless in the religious and political power structures of their day. His mother was a Galilean peasant woman and his father a carpenter. Shortly after the birth the child was supposedly taken on a trip to Egypt to escape the rage of the king. Almost nothing more is heard of the child until he is nearly 30 years old. This obscurity combined with the element of danger is symbolic of the extraordinary difficulties an individual must face and overcome in the attaining of psychic wholeness. The very possibility of achieving individuation is precarious. The emerging Self is realized by the conscious but is brought into consciousness by the unknowable and unpredictable forces of the unconscious.

The child Jesus is recognized by Simeon and Anna as the expected Savior of Israel. The Isaiah prophecy is repeated at this time, "Wonderful, Counsellor, the Mighty God, the Everlasting Father, The Prince of Peace" (Luke 2:25–38; Isaiah 9:5).

Jung speaks of the child god, or child hero, as a familiar archetypal figure in myth, religion, folklore, and in spontaneous psychic images in contemporary visions and dreams. The Christ child is only one among many such images, e.g., Apollo, Beller, and Hercules. Each of these has, in common with Christ, an obscure or miraculous birth, threat from the outset of life, the apparently invincible powers over which he ultimately triumphs, a destiny to bring light into darkness, and a death brought about by something intrinsic to his existence.

Christ's childhood and the appearance of symbols of Christ in the form of the divine child correspond to the necessary link that the Self forms with the primitive origins of humanity in general and with the individual person in particular. However, the significance of the Christ child and other child gods go beyond this. The child is represented as growing to become a future deliverer. The child therefore suggests potential. Individuation is a movement toward a goal. The child figure points to the necessity for the continued development of the emerging Self, but it is a development that does not involve the severance of the necessary roots in the past.

Birth of Christ

The emergence of the child figure in the individuation process is an anticipation of the future synthesis of conscious and unconscious elements in the personality. It is therefore, writes Jung, "a symbol which unites the opposites: a mediator, a bringer of healing, that is, one who makes whole" (Jung 1951/1979, par. 278).

The Christ child is also recognized as the one who brings light into darkness. The theme of light opposed to and threatened by darkness is recognized in connection with Jesus at a number of points in the New Testament and particularly in the writings of the Gospel of John. Light and day are, according to Jung, synonymous with consciousness, and similarly, darkness and night are synonymous with unconsciousness. Thus the advent of the bearer of light reflects the eruption of consciousness into existence and consequently its differentiation from the unconscious, a necessary prerequisite of true Selfhood.

In this context the infant Christ can be understood as the archetypal child-god/child-hero image, who performs the function of healing the individual and group by connecting back to the true origins, who gives a sense of destiny which is necessary to complete psychic wholeness, and who unites the opposites of light and dark, human and divine, conscious and the unconscious, in order to form a transcendent reality, a wholeness which is the Self. The child is the irrational third that consciousness could not conceive of unaided and which provides the necessary union of opposites and psychic attraction by its meaningful, but essentially unknown, content. In the individuation process the Self has to be experienced in terms that take seriously the materiality of the body. The child symbol also fulfils this objective because children provide potentiality, the promise of growth and development, but they also need to be physically cared for and nurtured.

Jesus of Nazareth

The Gospel records that after he commenced his public ministry, Jesus had nowhere to lay his

head: He lived a life of hardship, which culminated in the agony of Gethsemane. Christ's life parallels the process of individuation. In Jung's construction of this, there is much suffering and estrangement in the process of becoming individuated. In the individuation process, in a very real and frightening way, the rational person is threatened by this process, threatened with being swallowed up in a dimension greater than his ego can comprehend. All securities seem to be lost, menace seems everywhere present, and there seems to be no clear resolution to the conflict (Jung 1942/1948, par. 233). The experience of Christ upon the cross signifies the dramatic and extreme nature of the loss of all values that must be endured before the supreme value can be realized (Jung, 1940, par. 149).

Christ was crucified between two thieves: the one destined for paradise and the other for hell. The suffering emphasized here in the crucifixion clearly has a redemptive quality about it. Jung expresses the psychic analogy in terms of the crucifixion of the ego "in its agonising suspension between two irreconcilable opposites." The confrontation between consciousness and the unconscious presents a tremendous threat to the ego, but one that must be endured if the Self is to emerge. The ego must die, must relinquish its claims to being the center of the whole of psychic reality in order to make individuation possible (Waldron 2003).

After death comes 3 days in hell in which the loss of all value seems to be a permanent state. Then follows the resurrection and the ascension and newness of life. In the genesis, that is, the creative process by which the Self moves from a state of primeval chaos and unconsciousness into consciousness, order, and balance, the apparent chaos and absence of securities and order turn out to be a necessary part of the coming to terms with the depth of unconsciousness, in order to establish a new order of values and hence a supreme clarity of consciousness, by the integration of the contents of the collective unconscious into consciousness. The New Testament records few postresurrection appearances and the nature of these is often veiled. The woman at the tomb does not recognize the risen Christ (John

20:11–15). The disciples on the Emmaus road did not know him until he broke the bread (Luke 24:13–35). The disciple Thomas needed to feel the wounds of Christ before he would believe the testimony of his compatriots (John 20:24–39). So too, says Jung, "the transferred values are not easy to find or recognise" (Jung 1951/1979, par. 79).

Christ as Symbol of the Self

Sharn Waldron
Bungay/Suffolk, UK

The Self and the Christ

Jung wrote, "Anything a man postulates as being a greater totality than himself can become a symbol of the Self. . ." (Jung 1942/1948: par. 232). He also argues that not every image is fully adequate.

For him, the figure of Jesus Christ is not a symbol of totality because it lacks evil and sin. Rather, it is Christ's suffering at the hands of the collective society that is significant for it is an image of the suffering that the ego must go through at the expense of the unconscious, in the process of individuation (Jung, 1942/1948: par. 233).

Within the process of individuation – the realization of the Self – the image of Christ suspended on the cross between two thieves aptly expresses the tension between good and evil and between consciousness and the unconscious.

It is a paradox, a statement about something indescribable and transcendental. Accordingly, the realization of the Self which would logically follow from recognition of its supremacy leads to a fundamental conflict, to a real suspension between opposites (reminiscent of the crucified Christ hanging between two thieves), and to an approximate state of wholeness that lacks perfection (Jung 1951: par. 123).

Jung argues that the imitation of Christ does not consist of casting one's burden on Jesus but means undertaking the same experience of life that Jesus had, the way of individuation. That is the great and liberating thing about any genuine personality; he voluntarily sacrifices himself to his vocation and consciously translates into his own individual reality what would lead to ruin if it were lived unconsciously by the group.

There is a parallel between the symbol of Christ and the process of individuation. The incarnation of Christ is God becoming a human, the breaking into the world of consciousness from the unconscious, an integration of one with the other. For Jung, the Christ symbol is a part of the wider symbol of the Trinity. The Trinity symbolizes a process of development and consciousness that has taken place in the individual and the collective community over the centuries. Jung postulates that while the Trinity is symbolic of the process of individuation, it is not a symbol of the goal of that process, the realization of the Self (Jung 1954: par. 400).

Within this process, God the Father is representative of the unconscious state of childhood. At this stage of development, life for the child is habitual and law regulated. The incarnation

begins with the Son taking over the Father's position. This is not reflective of a development of consciousness because the old customs are still retained. Differentiation and development of consciousness occurs when the individual begins to reflect, discriminate, and suffer the conflict of the moral opposites resulting from his or her freedom from the law.

The advent of the Holy Ghost represents the recovery of the Father and his reintegration with the Son. Consciousness recognizes the unconscious as a higher authority that stands beyond the power of reason.

However, Carl Jung argues that a symbol of the Self requires a form that embraces good and evil and masculine and feminine. He perceives that evil and the feminine are both missing from the Trinity. Jung postulates the need for a compensatory essence within the god symbol. This is a fascinating development in Jung's thought. He is proposing, out of his conscious, clinical rationale to add to and modify a symbol which he has postulated emanates out of the unconscious and therefore is transcendent and universal. Jung partially addresses the question in *Psychology and Western Religion* when he states:

The God-image is not something invented, it is an experience that comes upon a man spontaneously. . . The unconscious God-image can therefore alter the state of consciousness, just as the latter can modify the God-image once it has become conscious (Jung, 1942/1948: par. 289).

For Jung, the inclusion of the doctrine of the Assumption of Mary within the god image is psychologically more satisfying. He proposes a quaternity which he states:

Is [a] consistent and logical restoration of the archetypal situation, on which the exalted station of Mary is revealed implicitly and must therefore become a 'conclusio certa' in the course of time (Jung 1938: par. 122).

Behind this dialectic interaction between the Trinity and quaternity stands Jung's hypothesis of the psyche. In his continuing pursuit of this missing fourth dimension, Jung seeks to explore the relevance of Satan and Christ as the dark and light sons of Father. God the Father is the equivalent to the unconscious. Christ and Satan are symbolic

representations of the tension between good and evil which originate in the development of consciousness. The continued incarnation of God in humankind through the Holy Ghost is representative of the process of individuation. The culmination of this conception of the symbol of quaternity is the birth of the Self.

For Jung, Jesus Christ is and is not a symbol of the Self. Jung argues that in the New Testament figure of Jesus of Nazareth, we see the development of a myth in which the portrait of Christ takes the place of the historical Jesus. It is significant and should be noted that Jung writes out of a time when one of the central issues in theology and biblical scholarship was the question of the differentiation between the historical Jesus and the overlays of reflection evident in the gospel narratives.

In this perspective, Christ became an object of his contemporaries' collective unconscious expectations, resulting in a general projection of divinity onto the figure of Christ.

The Christ and Jesus of Nazareth

The life of Jesus Christ has all the hallmarks of the hero's life: improbable origins, divine father, hazardous birth, miraculous deeds, symbolic death, and resurrection. These characteristics point to the underlying archetypal idea of the Self that is present in humanity as an unconscious process. In this way Christ realized the idea of the Self. Jung postulates that the Christ figure is "perhaps the most highly developed and differentiated symbol of the Self, apart from the figure of Buddha." Jung appears to carry his own personal contradictions on this issue. While at one point he argues Christ is the most highly developed symbol of the self, a little later he argues that Christ is not an adequate symbol but is an image of the journey. Christ "becomes" an embodiment of the Self. It is perhaps because Jung is not able to separate himself from a Calvinistic interpretation of Christ which is rather docetic in character. Waldron (2003) sees Christ as removed from the reality of normal human existence, and in this context, he is able

to parallel the Buddha and the Christ, which would seem an unlikely marriage. Buddha eschews the experience of human passion to attain paradise, but Christ embraces the passions, suffering, and evil in order to transform them.

Docetism was a second-century heresy which conceptualized Christ as a phantasm in order to address an inability to conceptualize God existing in a material and finite human form. To the Docetists, their perception of God as utterly holy and good was incompatible with God's existence in the form of a human, for being human meant being subject to the imperfection of the flesh, to dirt, to suffering, and, most significantly, to death.

In saying that Jung's view of the Christ is Calvinistic and as a consequence has a docetic character, I allude to the tendency of Calvinistic theology to have such a high view of the divinity of Christ that even though Calvin would say that Christ is fully human, his work suggests that the divinity of Christ strongly overshadows his humanity. Calvin sees Christ as all good. He may be a human being, but he is not a human being as others are human beings. He knows all. His words and actions are totally good. In his goodness, he redeems us who are of sinful flesh.

Jung always addresses the Christ question from the perspective of Calvinistic Christology. In Jung's framework, the self-revelation of God in Christ illustrates the way in which the problem of opposites arises when God becomes an object of conscious reflection.

In the Christ figure, because evil is absent, there is a void, a construct emanating out of a seemingly conscious reflection on the god-image. Jung sees the opposition between Christ and Satan as a more accurate reflection of the god-image (Jung 1951: par. 351).

When conscious reflection modifies the god-image, our sense of identity becomes based on our ideals of perfection instead of upon the complete psyche and the images emanating out of it. It is from this construct that Jung is able to differentiate between the god-image that is an aberration of one's unconscious and the god-image that is a totality, holding in tension the opposites and so engendering a reconciliation of the psyche.

Images of God

Jung reflects that while our images of god are a projection of our own unconscious, it is important not to confuse the image of god with that transcendent power which all images point to and hint at. As collectively and individually we move toward individuation, the god-image will, inevitably, correspondingly metamorphose to parallel the psychic reality. The transitions in the god-image are reflective of this journey. And yet, inevitably, the difference between the image of god which is a construction of reason and the image of god which represents the transcendent unconscious and is beyond perception of reason is only conceivable through our conscious perception. This conscious perception of the image of Jesus and the image of god is a reflection of our psychic journey. It is a reflection of our image of the Self.

Christian Female Saints

Nicol Nixon Augusté

Department of Liberal Arts, Savannah College of Art and Design, Savannah, GA, USA

Female saint veneration occurs throughout Christendom, though most prominently within Catholic and Orthodox traditions. Known as models of holiness, these women contribute to the communion of saints: the Church Militant (saints living on Earth); the Church Penitent (saints in Purgatory); and the Church Triumphant (saints in Heaven) (McNulty 1998). Some denominations adhere to an official canonization or recognition process, but also understand there exists innumerable saints outside of earthly knowing called the “cloud of witnesses” (Hebrews 12:1). A saint’s historical significance is twofold: she serves as an exemplary model for Christian living and promotes psychological, emotional, and spiritual solidarity. Modeling associated with rituals, narratives, symbols, relics, liturgical practices, and mystical experiences cultivates relationship between saint, believer, and the Trinitarian God. A communion such as this can aid in “identifying, articulating, maintaining, or transforming [the believer’s] relationship with the sacred” (Oman and Thoresen 2003).

Divine Union and Mystical Experience: Teresa of Ávila and Julian of Norwich

The female Christian saint shares a nuptial relationship with the deity of Jesus Christ: as a bride of Christ, her *marriage* reflects both Jewish and Christian “Scriptural image” of God’s “spousal relationship with His people” (Migone 2018). Here, holiness or sanctity is “a relationship...an absolute relationship to the Absolute” (Kreeft 2013). This kind of union can include intense mystical moments; these “spiritual experiences are based in the neuropsychological process of ‘selflessness’...The less individuals focus on the

self, the more capable they are of focusing on things beyond the self” (Johnstone 2012). Spiritual transcendence with the divine can manifest “dramatic conversions, visions, stigmata, and ecstasies” (McBrien 2001).

Spanish Doctor of the Church and foundress of the Discalced Carmelites, Teresa of Ávila’s (1515–1582) *The Interior Castle* captures her mystical experiences, including her spiritual ecstasy (see Fig. 1): Her Spouse [God] removes and restores the ability to breathe, speak, or feel her body – “the hands and the body grow cold.” For Teresa, the aftereffects on the mind can last days: the intellect “seems incapable of understanding anything that doesn’t lead to awakening the will to love.” Psychologically, these types of heightened occurrences reflect the “dissolution of

boundaries, with the ego merging into all of being” (Burton 2015). The person lets go of the self, suspending the external senses to an interior experience with the “religious subject” (Poulain 1909).

English anchoress Julian(a) of Norwich’s (1342–1416), *The Revelations of Divine Love* describes 16 notable revelations she receives from God. She recalls her severe suffering during her time of transcendence: “the greatest pain that I felt was my shortness of breath and the ebbing of my life” (Colledge and Walsh 1978). Smith (2016) relates these kinds of “sensory inputs drive response in the limbic system, which houses those functions responsible for deep-seeded, primal emotions.” Also, Julian speaks of God as mother: “[In] our true Mother Jesus our life is founded in his own prescient wisdom from without beginning, with the Holy Spirit.” Here, Julian unifies the godhead as “a result of her own psychological, spiritual and mystical integration” (Colledge and Walsh 1978). Her contemplative practices provide revelation of the divine’s motherly characteristics – nourishing, caring, merciful, wise, tender – within the masculine Trinitarian model (Colledge and Walsh 1978).

Martyrdom, Virgin Bodies, and Collective Memory: Agnes, Agatha, and Joan of Arc

Martyred Christian women remembrance includes the way they live(d) life (with joy in Christ’s resurrection) as well as their purposed gender within patriarchal structures. Many early Christian women met martyrdom with forgiveness for their executioners, as a Christian martyr’s death “can be forgiven by others. The remnant community names the martyr *by their forgiveness*” (Hovey 2015). Narratives, artwork, and relics (including body parts and incorruptible bodies) assist in preserving memory, connecting present and past.

A virgin tween, Agnes (d. 304 CE) was beheaded, a swift death afforded to Roman citizens. However, prior to her point of death, she faced attempted rape and public burning.

Death by continuous rape was common for Christian virgins because these women considered their bodies consecrated. Virginity allotted “reunification of sex as a sacramental way to experience God, along with freedom to renounce the social conventions that restricted women to marriages arranged for the sake of property and family status” (Conn 1993). Her tiny skull – located at St. Agnes at the Circus Agonalis in Rome, Italy – serves as a relic assisting in keeping both the archetypal martyrdom narrative and religious veneration alive. DeSoucey et al. (2008) understand attention to the corpse (in this case, Agnes’s skull) creates heightened reputation: “[Framing] the story of execution is an important moment to invoke the body for powerful visual and rhetorical effect.” Agnes is one of the female martyrs listed and read in the first Eucharistic Prayer of the Catholic Roman Missal used for the celebration of the liturgy; this repeated act of reading creates retention within the modeling of observational learning (Oman and Thoresen 2003). The other six women include Agatha (d. 251 CE), Anastasia (d. 304 CE), Cecilia (d. 230 CE), Felicity (d. 203 CE), Perpetua (d. 203 CE), and Lucy (d. 303/304 CE).

A direct result of her refusal to marry a local official named Quintianus, Agatha (d. 251 CE), a Sicilian virgin known for her beauty, was convicted of and martyred for practicing Christianity. Her narrative contributes to the landscape of early martyred women. Although she faced a variety of cruelties, she is most notably known for enduring a forced double mastectomy; Saint Peter supposedly healed her in prison, while she awaited execution. She later perished during forced submersion in a bath comprised of pottery shards and live coals (Butler 1990). The image of her breasts and brutal mastectomy create an “embodied martyrdom”; the body becomes a “marker” of “religiosity,” contributing to the cultural, historical collective memory and cause (DeSoucey et al. 2008).

Joan of Arc’s (1412–1431) triumph against the English and subsequent crowing of Charles VII as France’s king began with her mystical experiences with two other female saints, Catherine of Alexandria and Margaret, as well as Michael

Archangel. Joan’s body and gendered martyrdom have provided “reputational entrepreneurs” an opportunity to recreate her, memorializing the French heroine’s life and martyrdom; Joan’s rhetorical ethos (faith, fashion, patriotism) and suffering body encompass all at once a religious, cultural, and national marker embedded into a collective memory (DeSoucey et al. 2008). History would present la Pucelle (the Maid) as a point of national and religious ideological motivation in the nineteenth century, a political and women’s liberation symbol in the twentieth century, and a point of reference for gender and sexual orientation interpretation in the twenty-first century (DeSoucey et al. 2008). The use of Joan’s body within the narrative – or particular aspects of that narrative – promotes psychological retention, as produced in ritual and cultural “storytelling, devotional plays, singing, or textual material” (Oman and Thoresen 2003). This type of ritual observational modeling creates in her story a religious, historical, and folk heroine.

Modeling the Exemplars: Anna Ellison Butler Alexander and Teresa of Calcutta

Female saints serve as models for Christian living, creating a sense of solidarity and encouraging spiritual growth. Oman and Thoresen (2003) apply their concept of spiritual modeling to Bandura’s (1986) four major processes of observational learning: “attention, retention, reproduction, and motivation.” Briefly, attention occurs via directed focus; retention requires modeling repetition; reproduction functions to promote spiritual refinement; and motivation prompts living a positive spiritual life (Oman and Thoresen 2003).

Born to African American emancipated slaves, Anna Ellison Butler Alexander (1865–1947) was consecrated as the “only African American set aside in the order of deaconess in The Episcopal Church” (Saltzgeber 2011). Anna’s work positively affected those living locally and globally. She built a church-based school and a mission called The Church of the Good Shepherd. Although Anna lived within a southern culture

of segregation, racism, and misogyny, she rejected anger as “a wasteful emotion. Love energized.” She understood Christian ministry as intended for all people: though her mission was poor, “proportionately, Good Shepherd gave more support to needy folk throughout the world than any church in the Diocese” (Saltzgaber 2011). Applying positive psychology, Anna’s example of serving others provides moral elevation, prompting the reader/listener to become a better person, and “[facilitating] observational spiritual learning processes, such as attention and reproduction...of modeled spiritual skills” (Orman and Thoresen 2003).

Recipient of the 1962 Padmashri Award, 1979 Nobel Peace Prize, and 1985 United States’ Presidential Medal of Freedom, Albanian-Indian (Mother) Teresa of Calcutta (1910–1997) lived a life of service to God and others. She answered the *call within a call* to minister to the poorest of the poor, living with them. This foundress of the Missionaries of Charity would become a model of spirituality. Within the context of reproduction modeling, Oman and Thoresen (2003) identify observing “virtues such as charity, truthfulness (veracity), and humility” can model refinement in the life of the observer. Yet during her model life, Teresa experienced spiritual dryness for almost all of her final 50 years. Not hearing from God lead to feelings of abandonment and thoughts of disbelief in the existence of God. She “acknowledged the value of her pain—the absence of Jesus, her beloved” (Bedrick 2016). This state could fall under the category of absent grief (Bonanno in Garfinkel 2012), a type of grief that does not adversely affect people’s functionality. Garfinkel (2012) understands absence as positive:

The power of absence can be a vital, productive life force...the human search for immortality, or the eternal, or God [provides completion]...We can only know this fragmented and incomplete reality, so we are continuously frustrated by what it lacks.

Teresa agonizingly longed for the once-ecstatic relationship she and God shared. These expressions of pain contribute to the fullness of the life of a female saint, more wholly molding a model for authentic life – including joys and hardships –

lived within a psycho-physio-spiritual-emotional response.

Christian Fundamentalist Pastoral Care

Kelvin F. Mutter
McMaster Divinity College, Hamilton,
ON, Canada

Pastoral care practices within the conservative protestant Christian community (e.g., Evangelical and Fundamentalist churches) include methods of pastoral care and counseling that are derived from the Bible (Adams 1970; Kellemen 2014), approaches that draw from the accumulated wisdom of the Christian tradition as well as scripture (Roberts and Talbot 1997), and models that integrate theology and psychology into pastoral

practice (Collins 1980; Kollar 2011). While conservative Protestants who practice each of these approaches to pastoral care share a commitment to the authority of the Christian scriptures, those who are known as Fundamentalists have a preference for models of pastoral care that derive their practices from scripture rather than psychology, e.g., the Nouthetic Counseling movement (Adams 1970), the Psychoheresy Awareness movement (Bobgan and Bobgan 1979, 1994), and the Biblical Counseling Coalition (Kellemen and Forrey 2014). Themes that characterize these approaches include a belief in the sufficiency of Scripture to inform the priorities and methods of counseling practice, a perspective that embraces the tension between viewing people as being created in the image of God and believing that the problems of living are caused by sin, and a conviction that the goals of counseling are to help people experience God's love and to advance the work of God in their lives (Adams 1970; Bobgan and Bobgan 1979; Kellemen 2014).

Jay Adams is considered by many to be the founder of the Biblical Counseling movement. In his seminal book (*Competent to Counsel*, 1970) Adams proposed a model of pastoral care and counseling which he named Nouthetic Counseling. While Powlison (2010) characterizes Nouthetic Counseling as an antipsychiatry movement, Adams's primary concerns were that he believed psychiatrists and psychologists had usurped the role of the pastor and that the worldviews which inform these counseling approaches are incompatible with a Christian worldview. Adams (1970) characterizes the Freudian approach to psychiatry as creating an ethic in which personal problems are viewed as a sickness or a consequence of factors outside a person's control. Adams (1970) also takes issue with two humanistic assumptions that underlie Rogerian counseling: the assumption that the solution to a person's problems is within the person and that counseling is to be nondirective. Other psychologists with whom Adams disagreed include Alfred Adler, Albert Ellis, Rollo May, and B. F. Skinner (Adams 1970, 1973, 1975). Adams believed that Christian counseling should not be dependent on psychology and was against integrating within

pastoral practice any assumptions concerning human nature and behavior that are not derived from the Bible (Adams 1970, 1973, 1975). This perspective sets Adams and Nouthetic Counseling apart from Evangelical Christian counselors and pastoral care givers who integrate psychology and Christianity when they counsel people, e.g., correlational approaches (Farnsworth 1982), levels of explanation (Myers and Jeeves 1987), complementary approaches (Ingram 1995), and transformational psychology (Coe and Hall 2010).

Nouthetic Counseling differentiates between organically based mental health disorders which require medical intervention and *hamartiagenic* illness (i.e., caused by sin) which requires pastoral and spiritual intervention (Adams 1970, 1973). When it came to organically based mental health disorders, Adams supported people obtaining medical assistance and encouraged cooperation between the pastor and the physician (Adams 1970). When it came to *hamartiagenic* illness, Adams believed that true change required a spiritual process rooted in a person's experience of God's forgiveness and shaped by what Christians call sanctification, i.e., the process by which a person becomes free from the control of sin (Adams 1970). For Adams the strengths of this approach were that the person takes responsibility for their actions and that the person submits themselves to God. Adams recognized the limitations of using this approach with those who are not Christian and cautioned against using Nouthetic Counseling as a tool for proselytizing (Adams 1970). In terms of its methodology, Nouthetic Counseling effects change through the use of rational persuasion, scripture, and an emphasis on personal responsibility (Adams 1970). Both Adams and the Nouthetic Counseling approach have been critiqued for the authoritarian position into which the counselor is placed. Other criticisms include misusing Scripture, an inadequate view of human nature, a lack of interest in the internal dimensions of human life, failing to consider the impact and influence of a person's social context, a faulty view of change, and too much focus on a person's behavior (Powlison 2010). Lastly, Adams has been criticized for a superficial understanding of modern psychology that overly simplifies and misrepresents the psychologists he

criticized, conceptual dependence on the views of O. Hobart Mowrer, and an unacknowledged conceptual and methodological affinity between his approach and some behavioral therapists, e.g., B. F. Skinner, William Glasser, and Albert Ellis (Powlison 2010).

Larry Crabb's (1975, 1977) counseling approach shares some of Adams's concerns about psychology while at the same time integrating aspects of psychology and theology. His critique of counseling theory highlights what he believed was the amoral and antibiblical stance of Freudian psychoanalysis, ego psychology's emphasis on adaptive functioning, Rogerian therapy's optimistic view of human agency, the mechanistic nature of Skinner's behaviorism, and the subjectivity of Viktor Frankl's existentialism (Crabb 1975). Notwithstanding these critiques, Crabb integrates psychology and theology through a methodology in which his Christian worldview functions as the metaframe that organizes his selection and use of psychodynamic, cognitive-behavioral, humanistic, and existential insights and methods (Crabb 1975, 1977).

The Psychoheresy Awareness movement represents an alternative approach to the Biblical Counseling models. As with Adams, Bobgan and Bobgan (1979, 1994) are concerned with the cure of souls rather than the cure of minds and raise questions concerning the role of psychiatry and psychology in pastoral care and counseling. Their critique of nonreligious counseling includes concerns about a lack of precision in diagnosis as well as concerns about the worldviews that inform psychoanalytic, behavioral, humanistic, and existential approaches to psychotherapy (Bobgan and Bobgan 1979). To their credit, Bobgan and Bobgan provide more extensive descriptions of Freud and Rogers than Adams provides and reflect on other secular therapies, e.g., Reality Therapy, Scream Therapy, and Transactional Analysis. Their approach to the cure of souls is holistic in that it views people as bio-psycho-spiritual beings, emphasizes the person's relationship with God, and recognizes the role of hope and the therapeutic relationship in the change process. In addition, the Bobgans affirmed the central importance of scripture in the practice of soul care. It is worth noting that Bobgan and

Bobgan (1994) also criticize the Biblical Counseling movement for being unbiblical. Specifically they claim that one effect of Biblical Counseling training programs is that those who have not been trained in the methodology do not feel equipped to counsel, that the Biblical Counseling approach is too problem-centered, and that it is not in line with the historical practices of Christian soul-care (Bobgan and Bobgan 1994).

Despite, or perhaps because of, current trends in therapeutic practice which acknowledge the role of common factors that transcend specific models and which highlight the value of working with the religious and spiritual values of the counselee, Christian Fundamentalist Pastoral Care continues to ground itself in the Christian scriptures to the point that psychological insight is minimal or absent. For example, while MacArthur's text on counseling (2005) does not explicitly incorporate psychology, some of the discussion parallels what has been written about therapeutic common factors, i.e., the importance of the counseling relationship, the role of hope in counseling, and the role of extra-therapeutic factors such as the counselee listening for God and engaging in spiritual exercises.

Lastly, the Biblical Counseling approach rejects the integration of secular counseling theory with biblical theology on the basis that the worldviews which inform psychology are incompatible with a Christian worldview (Kellemen 2014; Kellemen and Forrey 2014). Similarly, the Biblical Counseling model emphasizes that God, not human activity, is the source of transformative change and that the purpose of life is to live in God's presence (Kellemen 2014; Kellemen and Forrey 2014). Thus the Biblical Counseling model is a religious soul-care model rather than a psychotherapeutic model. Although the Biblical Counseling model does not integrate psychology and theology, there is acknowledgement of the diagnostic categories of the Diagnostic and Statistical Manual of Mental Disorders as well as the use of psychotropic medication for depression (Kellemen 2014; Kellemen and Forrey 2014). The Biblical Counseling approach can be critiqued for its preoccupation with ideology and worldview questions, forcing Scripture to fit the constraints of the counseling situation, placing the

counselor in the role of expert, failing to understand the dynamics of serious mental health issues such as eating disorders, failing to understand the dynamics of serious interpersonal problems such as abuse, an inadequate view of change, and failing to make appropriate use of insights drawn from the field of psychology in its reflections on serious mental health conditions.

In summary, Christian Fundamentalist Pastoral Care refers to a cluster of pastoral care and counseling models that are suitable for use within Fundamentalist churches to support those who view life's problems through the lens of sin and personal responsibility and who do not present with serious mental health conditions. Because of the religious orientation of Christian Fundamentalist Pastoral Care, those who are outside Fundamentalist circles will find that these approaches tend to be overly concerned with sin and answering questions of personal responsibility. Methodologically, Christian Fundamentalist Pastoral Care rejects the worldviews that inform psychology and does not integrate psychology and theology. Whenever Christian Fundamentalist Pastoral Care acknowledges the value of psychology, or integrates psychology within its practices, theology determines the manner and extent to which these psychological perspectives are employed. Lastly, a key concern that is especially relevant in an era of professional licensure is that all forms of Christian Fundamentalist Pastoral Care open the door to the possibility of inadequately trained pastors doing damage to their counselees if they use these models to counsel people with serious mental health and relational disorders that may seriously impair the individual's judgement, insight, behavior, etc.

Christian Mysticism

Peggy Kay

Minneapolis, MN, USA

Division 32, Humanistic and Existential Psychology, Transpersonal Psychology Special Interest Group, American Psychological Association, Washington, DC, USA

Introduction: Mysticism as a Psychological Phenomenon and in Christian Context

Mysticism is a psychospiritual process that exists in relation to the rational, intellectual process and

is a psychospiritual phenomenon, a human and divine phenomenon. It is the same process but is experienced differently by each individual person and expressed variously within each religious tradition or outside of all traditions. The intrapsychic mystical process and experience is phenomenologically the same, while psychic contents being processed and religious and social manifestations vary by cultures through time. We as persons experience the mystical process universally, but each of us experiences it in a uniquely individual way spiritually and psychologically, and the mystical right brain interacts with our intellectual left brain in our consciousness.

Carl Gustav Jung's theory of Individuation – of spiritual development across the life cycle from ego emergence to ego transcendence toward the transpersonal and eventual merger with divine consciousness – describes the spiritual developmental process and concomitant transformation of psychological consciousness. This process is also understood in Roberto Assagioli's theory of psychosynthesis that as the person transforms spiritually, the person must resynthesize the personality at the higher level of consciousness. Both theories describe psychologically the spiritual process of mysticism in human experience, which is understood in various ways within and outside of the practice of religion. Mysticism begins its expression within Christianity with the incarnation of Jesus.

Mysticism as Religious Experience

Religion can be considered to have three main dimensions: religion itself, religious practice, and religious experience. Mysticism is religious experience, and each religion has a mystical component. Religious experience is personal religion, or spirituality, which has its roots in mystical states of consciousness. William James in his classic *Varieties of Religious Experience* gives this foundational understanding of mysticism psychologically and experientially. "Mystical states . . . add a supersensuous meaning to the ordinary outward data of consciousness. . . facts already before us fall into a new expressiveness and make a new connection with our active life"

(James 1902/1958, p. 356). He concludes, “We and God have business with each other; and in opening ourselves to his influence our deepest destiny is fulfilled” (p. 425).

Mysticism brings to our newly expanded consciousness both wisdom and joy. “Expansion of human consciousness into cosmic consciousness by the art of concentration brings to the devotee a joyous wisdom far greater than the satisfaction of theoretical knowledge – however profound – resulting from the study of books” (Yogananda 1994, p. 280). The mystic lives an increasingly spiritual life and discovers experientially the scriptural teachings that God-relationality provides for our spiritual and temporal needs.

Through history and across world religions, mysticism as religious experience has waxed and waned in relation to religious education, doctrine, scripture, practice, and other social institutions and customs. In times when mystical Christianity has been at low ebb in relation to formal doctrine, practice, and theological education, the mystics themselves have kept the mystical tradition alive until it could again outwardly flourish. We see in Christianity today that the focus on doctrine and practice has evolved through literary and historical-critical analysis to be primary, but mystical and religious experience is once again emerging to be essential in desire for personal religious experience for spiritual growth and psychological healing and wholeness.

Mystical Consciousness in the Christian Tradition

The original mystical state of consciousness in Christianity is that of Jesus. From his birth Jesus was imprinted with Jewish tradition, from which emerged his own mystical consciousness. As he continued through his life and ministry, his teachings were about mystical consciousness in the person, or human consciousness, and the relationship of human mystical consciousness to divine or cosmic consciousness. Christian mysticism consists of Jesus’ teachings about the mystical nature of the person, the mystical process within the person, and the relationship of the personal mystical consciousness to the divine consciousness.

Jesus as Mystical Cosmic Christ

Jesus was identifying with his Cosmic Christ essence, God’s essence, when he said, “What my Father has given me is greater than all else, and no one can snatch it out of the Father’s hand. The Father [God] and I are one” (John 10:29–30). It is this oneness that makes the Father-Son-Holy Spirit Trinity one cosmic essence. He was also demonstrating that his personal mystical consciousness was aware of and in relationship with his universal eternal mystical essence, cosmic consciousness, which in Christian tradition is named God.

In the life of Jesus, Christ consciousness incarnate, we see his essence as omnipresent, from the draw of the Magi to visit him as a child until he ascends into heaven to rejoin God after his resurrection. We see this in the first four books of the Christian, or New Testament, scriptures: Matthew, Mark, Luke, and John, called the Gospels or Good News. Jesus showed that this would be good news for people spiritually because of the message it delivered, and he knew the news would be received psychologically as good.

Examples of the Good News Jesus delivered can be seen in two scripture passages. The first is, “The kingdom of God is not coming with things that can be observed; nor will they say, ‘Look, here it is!’ or ‘There it is!’ For, in fact, the kingdom of God is among/within [Greek *entos*] you” (Luke 17:20–21). This passage points to the intrapsychic spiritual mystical process and implies inner, personal locus of control. The second is, “Repent, for the kingdom of heaven has come near/is at hand” (Matthew 3:2). In this passage Jesus speaks in prophetic voice to instigate change in psychological consciousness of people regarding their own behavior, to encourage spiritual transformation in preparation for union with divine consciousness. His directness indicates urgency and immediacy, and he indicates that human agency, or motivation and choice, accomplishes spiritual transformation into the kingdom of God.

Jesus’ ministry, as described in the four Gospel books, taught that the mystical inner relationship of the person to God exists by nature in everyone – as in Jungian individuation – and Jesus set his life,

death, and resurrection as evidence of the eternal mystical essence as core to human existence. Subsequently, in the Acts of the Apostles, the disciples of the Master Jesus the Christ, led by Peter, began to travel outward after Jesus' death, resurrection, and ascension to tell the Gospel story and teach the spiritual, mystical principles Jesus had taught to them.

Paul Emerges as Mystic and Christian Scriptures Are Formed

At this time in the book of Acts, Saul, who was persecuting Jesus' followers, had his mystical conversion experience while going blind and regaining his sight (Acts 26) and became Paul, a disciple. He was transported as a prisoner to other countries, freed, and began to tell the Gospel in foreign lands including Rome, Corinth, Galatia, Ephesus, Philippi, Colossus, and Thessalonica. Letters written from Paul to the fledgling churches in these lands form biblical books that follow Acts. He testified to his own spirit's mystically and physically transformative experience of the Spirit of God and preached and taught Jesus' mystical teachings, such as the nature of human spirit as part of God's Universal Spirit, particularly in Corinthians.

Do you not know that you are God's temple and that God's Spirit dwells in you? If anyone destroys God's temple, God will destroy that person. For God's temple is holy, and you are that temple (I Corinthians 2:16–17).

So we do not lose heart. Even though our outer nature is wasting away, our inner nature is being renewed day by day. For this slight momentary affliction is preparing us for an eternal weight of glory beyond all measure, because we look not at what can be seen but at what cannot be seen; for what can be seen is temporary, but what cannot be seen is eternal (II Corinthians 4:16–18).

Throughout the balance of Christian scripture, the locations expand and the mystical teachings culminate in the final and prophetic book of Revelation. John writes, "Then I saw a new heaven and a new earth. . . the home of God is among mortals. He will dwell with them; they will be his

peoples, and God himself will be with them; he will wipe every tear from their eyes. Death will be no more; mourning and crying and pain will be no more, for the first things have passed away" (21:1–4).

Traditions Develop, Mystics Make Their Marks, Psychology Understands

As churches cohere the Christian religion develops into what we now know as the Catholic tradition that remained Latin, the Greek tradition that became Eastern Orthodox Christianity, the Anglican Church that became English tradition, and Protestantism that has continued to develop into distinct denominations, particularly in the West. Christian mysticism has evolved in all four traditions, although uniquely in the Orthodox tradition, "The inward and personal aspect of the mystical experience. . . remains hidden from the eyes of all" (Lossky 1957).

In psychology, the psychologists of religion and spirituality understand the mystical process and spiritual nature of humanity to be integral to the human psyche and at the core of the human person, existence, and life. Carl Jung's colleague Jolande Jacobi summarizes Jung's theory of individuation of the person, personality, and spirituality across the life cycle.

It is a question of moving from an "ego-centred" attitude to an "ego-transcending" one, in which the guiding principles of life are directed to something objective. . . from one's children, one's house, one's work to the state, humanity, God. . . The possibility of a maturation and rounding out of the psyche is in principle inherent in every individual. . . The important thing is not the widened scope which consciousness attains, but is "roundedness" . . . i.e., a state in which the greatest possible number of man's hidden qualities are made conscious, his psychic capacities developed and condensed into a unity. This is a goal which generally can be reached – if at all – only in life's late evening (Jacobi 1973, pp. 24–25).

Some mystics are clergy, some laity, and some saints. All are loved and revered as part

of the story of Christianity and exemplars of the mystical body of Christ. All mystics speak of the goal of mysticism as union with God through love.

c. 1–34 CE Jesus

Whoever believes in me believes not in me but in him who sent me. And whoever sees me sees him who sent me. I have come as light into the world, so that everyone who believes in me should not remain in the darkness. I do not judge anyone who hears my words and does not keep them for I came not to judge the world, but to save the world. . . I have not spoken on my own, but the Father who sent me has himself given me a commandment about what to say and what to speak. And I know that his commandment is eternal life. What I speak, therefore, I speak just as the Father has told me (John 12:44–50).

c. 33–64 Saul/Paul

From one ancestor [God] made all nations to inhabit the whole earth. . . so that they would search for God and perhaps grope for him and find him. . . For “in him we live and move and have our being” (Acts 17: 26–28).

1542–1591 St. John of the Cross

The first passion of the soul and emotion of the will is joy. . . Joy. . . is nothing else than a delight of the will. . . The will should rejoice only in what is for the honor and glory of God (1991, p. 294) (Fig. 1).

1898–1963 C. S. Lewis

Out of ourselves, into Christ, we must go. His will is to become ours and we are to think His thoughts, to “have the mind of Christ” as the Bible says (1945/1996, p. 189).

1901–1981 Howard Thurman

Mysticism deals with the inner personal response to God. . . It speaks . . . of utter and complete absorption in the experience of union with God. . . [spiritual] exercises are meant to “ready” the spirit for an awareness of the Presence of God dwelling in the core of the individual’s being (2002, p. 189).

1929–1968 Martin Luther King, Jr.

I’ve been to the mountaintop. . . [God has] allowed me to look over. And I have seen the promised land. . . we, as a people, will get to the promised land. . . Mine eyes have seen the glory of the coming of the Lord (1968).

Christianity

Jeffrey B. Pettis

Department of Theology, Fordham University,
New York, NY, USA

Christianity begins in the first century CE and occurs as an outgrowth of a variety of groups that constitute Judaism during this time. It has as its focus the figure of Jesus of Nazareth who preached, taught, and practiced an interpretation of second-temple Judaism and the Torah which drew both adherents and opposition. He was eventually martyred in Jerusalem ca. 33 CE. Christians claim that he was resurrected by God from the grave and that he yet lives and is present as *ho Christos*, “the Christ” (meaning the “Anointed One”). Early believers gathered in their homes to worship and partake in rituals including the Eucharist and baptism. A variety of Christian groups emerged, including the Petrine following in Jerusalem, the Johannine community possibly in Palestine, the Montanists in Asia Minor who focus on eschatology, and the Pauline movement with its focus on Gentile membership. It is not until late first century and early second century that the “church” and Christianity as a religion begin to take form as an institution, evidenced, for example, in the letters of Ignatius of Antioch (ca. 100 CE) who gives much attention to ecclesiology and the central role of the bishop as head of the congregation. “We are clearly obliged to

look upon the bishop as the Lord (*ton kurion*),” he writes to the church at Ephesus (6.1). To the church in Smyrna, he writes: “All of you should follow the bishop as Jesus Christ follows the Father; and follow the presbytery as you would the apostles. Respect the deacons as the commandment of God. Let no one do anything involving the church without the bishop” (8). For early Christians, the Jewish scriptures represented the authoritative sacred writings. At the same time, a new collection of literature begins to emerge from an oral tradition of the sayings of Jesus. The letters of Paul represent the earliest Christian texts and, along with other writings deemed important by Christian leaders, become part of the New Testament canon. Together, these writings which include stories, teachings, exhortations, parables, sermons, travel accounts, and sayings relate the Jesus of history and even more the Jesus of theology. Paul speaks of encountering the posthumous Jesus in a vision experience and the potency of that experience for Paul leading to his Christian conversion (2 Cor. 12.1-10; 1 Cor. 9.1; 15.1-6). From this event, Paul becomes passionate to include Gentiles into Christian membership, as he establishes church communities in places such as Corinth, Philadelphia, and Galatia. The NT canon consists also of the Gospels. The Gospel of Mark presents Jesus as one who exorcizes demons and moves in mysterious secrecy amid the crowd and his followers. The Gospel of John presents Jesus who is the logos made flesh and dwelling in the material world. The Gospel of Luke presents Jesus as a social reformer, and the Gospel of Matthew presents Jesus as a great teacher. In this way, the Gospel writers each present Jesus in ways specific to their own sociopolitical and religio-spiritual concerns. They all however present Jesus as the bringer of a new age. In Mark, Jesus is clear to say: “The time has been fulfilled (*peplērōtai ho kairos*) and the kingdom is near; repent and believe in the good news (*euangelion*)” (Mark 1.15; cf. Matt. 4.17; Luke 4.15; cf. John 13.31-33). With regard to the era of Christianity, Jung refers to the emerging of the Aion, or *piscus* (Latin, “fish”), the new archetype embraced by the collective (unconscious). The fish is symbolic of Christ coming to the surface and made manifest as the true Light (1 John 2.8-

11) in the waking, conscious world. Early Christian catacomb includes the fish as symbol of Christ, the Greek spelling for fish, *ichthus*, taken to mean “Jesus Christ Son of God, Savior.” In the Gospels, there are accounts of Jesus providing fish to feed large groups of people (Mark 6.35-44; Luke 9.10-17; Matt. 14.13-21; cf. John 6.1-13), and in the Gospel of John, Jesus’ final post-resurrection appearance is to the disciples whom he causes to have a great catch of fish, a portion of which they all share as a meal (John 21.1-14). The early church into the Middle Ages struggles to define the relationship between the human and the divine in the figure of Jesus. The Council of Nicea (325 CE), consisting of about 300 bishops called together by the Roman Emperor Constantine, is significant for establishing the notion of *homoousios*, Christ being of the same substance as the Father. Through Constantine’s conversion to the faith, Christianity becomes the official religion of the Roman world, which includes the western Latin church and Rome and the eastern Greek church with its center at Constantinople. Many of the religious beliefs and practices of these two traditions remain into the present time.

Christianity and Sexuality

Ellen T. Armour
Carpenter Program in Religion, Gender and Sexuality, Vanderbilt Divinity School, Nashville, TN, USA

No topic has been the object of greater controversy in Christian circles in recent decades than sexuality. Families, congregations, and even denominations risk being torn asunder by the question of whether homosexuality, in particular,

is compatible with Christianity. Though this controversy hardly exhausts the topic at hand, it provides a useful point of entrée into the topic's complexities, which are frequently overlooked.

Let's start with two questions often heard in these debates: (1) Is homosexuality "natural" or is it a "lifestyle choice?" and (2) What does the Bible say about homosexuality? Both questions tacitly assume that the forms that sexuality takes in our time and place – and our understanding of "sexuality" itself – are universal and ahistorical. Yet the very terms of the questions belie that assumption as contemporary scholarship has shown. "Homosexuality" and "heterosexuality" are European inventions that date from the late nineteenth century (Foucault 1994; Katz 2007). Let me spell out carefully what I mean – and do not mean – by making this claim. I do not mean that same-sex desire, same-sex acts, or same-sex relationships are modern European inventions. That we think we find answers to our second question in the Bible shows that this is clearly not the case (though whether the Bible actually *answers* our question is highly debatable). But how such aspects of human behavior are named, understood, organized, and lived out in relationship to social norms varies with time and place. My claim here is only in part an etymological one; the words "heterosexuality" and "homosexuality" are of recent European provenance, but so is the fullness of what they reference. The emergent field of psychology, which sought to catalogue and to understand the variety of humanity's erotic interests and practices, was formative in their creation. As its work made its way out into the larger world (largely through efforts to manage public, familial, and personal health), those under its sway incorporated them into their sense of identity – their own and others. So much so that we now understand "sexuality" as a singular root of who we are. Sigmund Freud's work was particularly influential here. He established identity formation as a project that starts at infancy and draws on unformed but powerful energies with which we are born, which are shaped and channeled by our experiences in family and society.

Moreover, it is not just the *categories* of sexuality that we currently use that are of relatively

recent vintage; it is the larger framework in which they are embedded. That framework links "sexuality" (erotic desire and acts) to (anatomical) "sex" and to "gender" (cultural roles) in a linear fashion. Ours is a binary taxonomy; we expect people to be either homosexual or heterosexual, male or female, and masculine or feminine. Moreover, we expect biological males to act masculine and to desire women. We expect biological females to act feminine and to desire men. Professing or exhibiting same-sex desire calls into question one's gender (e.g., we associate male homosexuality with effeminacy) and even one's sex. Certain contemporary scientific investigations into the biological roots of homosexuality, for example, look for signs of deviation from certain normative features of male or female embodiment – in, for example, the size of one's hypothalamus, in finger length (Armour 2010; Hamer and Copeland 1994; LeVay 1996).

The Greco-Roman culture in which Christianity came into existence thought about these matters rather differently than we do (Martin 1995). Instead of a binary and linear system that cleanly distinguishes male from female, masculine from feminine, and heterosexual from homosexual, their system was more of a continuum in which manhood was normative and womanhood was derivative. The philosopher Aristotle is infamous for calling women "misbegotten males," a statement that may sound like an insult but is intended as merely factual. When reproduction went normally, according to his understanding of biology, it yielded a male body. The birth of a female meant something had gone awry. But simply being born with a male body didn't guarantee the development of manliness. Bodies – especially infant bodies – were both vulnerable and malleable; caregivers needed to mold and shape those bodies through applying proper amounts of heat or cold and dryness or moisture and through massage to develop their proper shape and character. Though much less malleable, the bodies of elite male youths (and even adult men) also needed careful cultivation to attain and sustain the full degree of manliness of which they were capable. Although diet and exercise were central, so also was erotic practice, that is, who one had sexual relations with

and how. For example, whereas our culture associates what I will call *homosex* (same-sex sexual acts) among men with effeminacy regardless of who penetrates whom, the ancient Greeks distinguished between the penetrator (a virile position) and the penetrated (an effeminate position). But they also believed that too much sex with *women* made the penetrator vulnerable to effeminacy. In general, though, what mattered in this context was less the gender or sex of one's partner than his or her social status. Pederasty, a sexual relationship between a young elite man and an older elite man was a standard practice in ancient Greece. These relationships were essentially apprenticeships in which the older schooled the younger in the *mores* of elite manhood and helped him make important contacts with other elite males.

We may get the *word* "family" from the Latin *familia*, but our families look quite different from those of ancient Rome – and ancient Israel, as well, for that matter. Families in both contexts were organized around married patriarchs, but, as exemplified in the story of Abraham and Isaac in Genesis, Israelite patriarchs practiced concubinage; Abraham was married to Sarah, who gave him Hagar as a sexual partner (by whom Isaac was conceived) when it became clear she was barren. Jacob, the father of the eponymously named 12 tribes of Israel, was married to two wives who were sisters, Leah and Rachel. Roman patriarchs married only one wife, but were allowed – even expected – to have sex with other women (as long as they were not married to other men) and men (as long as they were of lower status). Having sex with one's male slave, for example, compromised neither a patriarch's marriage nor his masculinity (as long as he did the penetrating).

Yet culturally, experientially, and scientifically, we are coming to know that things are more complex than that. Thanks to the second wave of the feminist movement, what counts as appropriate behavior for men and women has broadened considerably in recent decades. Where athleticism used to indicate latent if not active lesbianism (and thus a "masculinity complex" of some sort), we now expect and encourage girls and women to take up sports. There are limits, however, to the compatibility of athletic success and femininity

(Levy 2009). Getting a manicure or wearing a scarf and earrings is acceptable masculine behaviors these days, though carrying a "murse" (a man purse) may be pushing it in some contexts. More significantly, consider the now-ubiquitous acronym "LGBTQI." The last four letters, in particular, index forms of gendered, sexed, and/or sexual identity that we are only recently acknowledging as a society. And each of these forms troubles our neat binary system. The "B" refers to bisexuals, people who are attracted to sexual partners of both the same and opposite sexes. The "T" stands for both *trans gendered* and *trans sexual*; in the first case, people who do not identify with the *gender* they have been assigned or, in the second case, with their anatomical sex. While some in these categories seek to live as the opposite gender or sex, many more live out their lives somewhere in between – or outside – normative masculinity/femininity or normative manhood/womanhood. These people may identify as "queer," a formerly derogatory term for homosexuality that has been retrieved as a catchall for non-normative identities. A number of people now identify as *genderqueer*, for example. Finally, the "I" stands for "intersexed," people whose anatomical and/or biological sex is in some way ambiguous or combines features usually seen only in one or the other sex.

By "anatomical sex," I mean what we have come to call primary and secondary sex characteristics: whether one has a penis or vagina and the accompanying internal reproductive organs (primary) to match along with the bodily features (secondary) we expect bearers of each of these organs to have such as breasts, facial hair, and a certain body shape. By "biological sex" I mean all of the internal genetic and chromosomal markers, hormones, and other factors that produce anatomical sex – and other features of human embodiment – in the various forms it takes. Intersexed conditions take a variety of forms at both the anatomical and biological levels. While, most of the time, a person with an XX chromosome, say, will exhibit all the bodily signs we associate with normative femaleness, things can turn out differently at just about any point along the way. The result can be, for example, a female with a vagina

and breasts but with internal reproductive organs that are more like testes than ovaries or whose external sex organ is more penis like. And one can neither predict nor assume, on the basis of these bodily configurations, gender identity *or* sexual orientation. Clearly, our binary system is inadequate to the reality of this complexity (Fausto-Sterling 2012).

So what are the implications of all of this for how we think about sexuality and Christianity? And where can the discipline of psychology be of help to Christianity's ongoing attempts to work out what count as faithful expressions of sexuality? Let me return briefly to the two questions with which I opened this entry. The account I have offered above suggests that both questions are framed far too narrowly – and thus so are the answers they invite. To inquire after the Bible's views on homosexuality is to pose a question it cannot answer, since there was no such thing as *homosexuality as we understand it and live it* in the biblical worlds. Again, that does not mean, as we have seen, that ancients did not experience same-sex desire or engage in same-sex acts. Rather, those desires and acts were *understood and lived* under very different social and familial systems than ours. This, it seems to me, is an important insight for ministers, therapists, and pastoral counselors to bear in mind when working with parishioners or patients who are struggling to reconcile sexual issues of whatever sort with their Christian faith. Similarly, to claim homosexuality is a “lifestyle choice” simply ignores the role sexuality currently plays in our sense of identity and in our lives – whether we are gay or straight. Yet to claim homosexuals are “born that way” is too simplistic, a claim that scientists researching the biology of homosexual make clear. Whatever our sexual orientation or gender identity might be, it is likely the result of multiple factors: biological factors, no doubt, but also our individual histories and experiences, including choices we make.

Psychology has played a critical role in both the pathologization and the normalization of the various senses of self that LGBTQI attempts to capture. So, for many years, the Diagnostic and Statistical Manual of Mental Disorders (popularly

known as the *DSM*), authored and published by the American Psychological Association, classified homosexuality as a disorder, but ceased doing so in 1973. In fact, the APA has spoken out strongly against so-called reparative therapy that claims to “cure” homosexuality. As the APA moves toward its 5th major revision of the manual, a similar shift is occurring around trans issues. “Gender dysphoria,” a less pejorative term, will supplant gender identity disorder as a direct attempt to “stop ‘pathologiz[ing] all expressions of gender variance’” (Lowder 2012). What impact this will have on Christianity as it continues to wrestle with issues of sexuality, identity, and faith remains to be seen.

Chthonic Deities

Sukey Fontelieu

Pacifica Graduate Institute, Carpinteria, CA, USA

Chthonic is from the Greek, $\chi\theta\nu\nu\iota\omicron\zeta$ or *khthonios*, meaning “of the earth” and is used in reference to that which is beneath the surface of the earth or the underworld and its state of darkness. Chthonic also refers to a state of abundance. For the ancient Greeks, chthonic was not to be confused with the visible layer of the soil, where Demeter reigned as the goddess of the harvest or with Gaia, the earth mother who bore and united with Ouranus and is a primal life force (Farnell 1908/1971). Rather, chthonic implies lower, abundance, darkness, and death.

The chthonic deities and heroes were worshipped in their own cults and sacrificed to in specific ways that differentiated them from Olympian deities. For example, black-skinned animal offerings were preferred for sacrifice to the chthonian gods and light skinned for the Olympians. However, any sort of strict lines of demarcation to categorize the Greek’s system of religious affections meet with frustration. The line between the chthonic and the Olympic is immediately blurred as soon as one considers Persephone, Hermes, or, for that matter, Zeus himself, who had cults where he was worshipped with the epithet *Zeus Chthonios* (Burkert 1977/1985).

A chthonic deity, then, is the carrier of the projection of human nature’s instinctive drives

and dark, rejected propensities and yet is also a fertile and divine source of abundance. Aspects of human nature that were wisely discerned by the ancient Greeks with caution and recognized as potentially dangerous in humans were nonetheless honored in their gods. Through rituals, the Greeks were participating in a relationship with the projected darker parts of their own nature. Devotion to this principle has fallen into disuse.

Psychological Implications

Today, rather than a reverential attitude toward the awesome power of the chthonic force, even in psychological systems and religions, much of this drive is the target for a lifelong battle to contain, banish, or defeat it in oneself and in society. Unlike the Greek chthonic cults, today, darkness is not worshipped, it is feared. Denial of the dark side of the soul (dark did not mean evil to the chthonic cults, but implied an insufficiency of illumination) inevitably creates projection of one’s own unacknowledged urges onto others.

Death was considered transformative for human beings in religion in the ancient Greek cults and is still thought to be so today. Today, only if the darker aspects of the personality are defeated does the transformation end in a better life. The dead were understood to be of aid to the living by the Greek cults, and all mortals went to the underworld after death. Immortality was not bestowed upon a mortal based on a judgement of the quality of their life. The chthonic cults worshipped their ancestors and heroes at their gravesites, believing that the dead were able to deliver oracular messages that could help them with their daily burdens.

Dualistic Thinking

Dualistic thinking categorizes the chthonic in a split between good and bad. Chthonic is bad. Olympian is good. But to the ancient polytheistic cult members, this would be a gross oversimplification. They might even view it as the one

psychological state they perceived as sinful: hubris. The chthonic gods and goddesses all had healing and destructive tendencies, as did the Olympians.

The Greek God Pan

One well-known example of the chthonic is personified by the Greek goat-god Pan. Pan's cult began in Arcadia on the Peloponnesian peninsula. He was half divine and half beast, a god of fertility, the hunt, and an aide to men and the divine in battle. He also brought panic and unbridled sexuality. Other Greek chthonic cults worshipped Hermes, Hades, Persephone, Dionysus, Hecate, and Hephaestus, among others. Each carried different shades of the chthonic spirit, which the polytheistic Greeks saw as aspects of the many sided mystery that surrounded and animated all of life.

two different outward forms, each with a slightly different but related psychological meaning. The first use of sacred walking comes in the form of a communal act of celebration of a particular deity or saint. At various times in the religious calendar of ancient Egypt, an image of the god was taken out of its shrine and paraded for the people to see. In many Roman Catholic countries, statues of saints are taken around the plaza on the saint's festal day. These acts of circumambulation are a kin to an animal ranging over the domain of its territory. The parade marks the loyalty of the local populace to the patron deity or saint. Another form is solitary or more solemn pilgrimage. An example of this would be the circumambulation of Mt. Kailash in Tibet. This is a multiday journey and involves not only the physical travail of a difficult and long hike, but becomes a focal period of reflection, meditation, and devotion.

In either form, the act of circumambulation is a human attempt to create or observe what Eliade (1959) termed "sacred space" and "sacred time." In the act of marking off a space through physically walking its circumference, humans create a boundary between the sacred and the profane or mundane aspects of their world. In the course of the journey of circumscribing a space, the person or group exists in sacred time. Often, the opportunity provided by a daylong or even multiday event allows individuals who participate to enter into ecstatic trance states or deeply focused meditational states even as they are active in a bodily sense.

Circumambulation

Paul Larson
The Chicago School of Professional Psychology,

Circumcision

Mark Popovsky

Department of Pastoral Care, Weill Medical
College of Cornell, New York Presbyterian
Hospital – Chaplaincy, New York, NY, USA

General

Circumcision refers to the removal of the prepuce (foreskin) covering the glans of the penis. Egyptian mummies from 2,300 bce were found circumcised, and earlier wall paintings suggest that the practice began long before. Approximately one-sixth of the world's men today are circumcised; the vast majority are Muslims or Jews. Throughout history, the basis for the procedure has traditionally been religious or cultural; however, in America, Canada, and Australia, many men are circumcised for medical or esthetic reasons.

No consensus exists as to how circumcision originated. Anthropologists have proposed theories including that it began as a mark of defilement for enslaved man, that it served as a sign of cultural identity similar to a tattoo, and that it once was believed to enhance fertility. Today, circumcision is the norm among Muslims, Jews, some African churches, several African tribes, and Australasian Aborigines.

Judaism

Religious Jews traditionally circumcise male babies on the eighth day unless there is a health-related reason to postpone it. The act is performed by a *mohel* (circumciser) who need not be either a rabbi or a physician. The baby is held firmly by the *sandak* (holder) who is usually an elder male relative. Traditionally, the procedure is done without anesthetic. In premodern times, blood was sucked from the penis following the cut. Among most Jews today, this is done only symbolically using a straw.

Circumcision is understood by Jews to signify acceptance into the covenant between God and the Jewish people whereby Jews agree to follow the laws of the Torah and God and, in turn, agrees to bless the Jewish people. An early iteration of this covenant between God and Abraham is described in Genesis 17; the passage concludes with the command for all of Abraham's descendents to be circumcised. Covenants in biblical times were often sealed by severing an animal, with the implication that the party who breaks the covenant will suffer a similar fate. In Hebrew, the verb meaning to seal a covenant translates literally as "to cut." It is presumed by Jewish scholar that the removal of the foreskin symbolically represents such a sealing of the covenant. A number of sovereigns, beginning with Hadrian and Justinian, attempted to forbid the practice among Jews and anti-Semitic rhetoric throughout Western history has often included a notable anti-circumcision component. Some Reform Jewish theologians of the nineteenth century argued that circumcision should be abandoned as it ran contrary to the Jewish principle of universality. Despite common misconceptions, a child born to a Jewish mother is considered fully Jewish regardless of whether or not he has been circumcised.

Christianity

With Paul's teaching that faith served as a sufficient prerequisite for conversion to Christianity, circumcision fell away as a religious ritual for early Christians. It is explicitly rejected as a requirement for conversion in Acts 15:3–11 and Galatians 5:6, but nontherapeutic circumcision was never forbidden by the Roman Catholic Church until the fourteenth century. The practice has been retained in Coptic and Ethiopian Orthodox churches.

Islam

Though circumcision is not mentioned explicitly in the Koran, it is considered to be a binding

“prophetic tradition” among Muslims. There is a great diversity of opinion among Islamic jurists as to the proper time for the ritual to be performed. Often it is during the first 40 days of life, most commonly on the seventh day; however, it can be as late as age seven in some communities. Who performs the circumcision and how vary significantly from community to community in the Muslim world.

Psychology

Freud understood Christianity as a “religion of the son” which held an Oedipal desire to kill the “religion of the father,” Judaism, from which it was born. Freud further viewed circumcision in Judaism as symbolic of man’s submissiveness to God. Consequently, by rejecting circumcision and thus removing that symbol of submission, the “son” asserts its authority over the “father.” Freud views circumcision as symbolic of castration, and he posits that much anti-Semitism may be rooted in the anti-Semite’s fear of castration. Other psychoanalyst theorists have disagreed with Freud, arguing that far from serving as a symbol of castration, circumcision gives the penis the appearance of a permanent erection. The ritual then may seek to ensure fertility and the continued existence of a group which perceives itself as threatened.

Contemporary Debate

A passionate debate as to the value of circumcision rages across the literature in the fields of medicine, psychology, and anthropology among others. Proponents often cite medical benefits and the importance of respecting cultural traditions. Opponents generally focus on the pain of the procedure to the infant and rights of the neonate. No solid data exists as to the long-term psychological impact – positive or negative – of circumcision on the individual. The mere intensity of the debate attests to the fact that the practice strikes deep psychological chords for many.

City

David A. Leeming
University of Connecticut, Storrs, CT, USA
Blanton-Peale Institute, New York, NY, USA

Cities (and villages) have traditionally represented various concepts associated with the idea of centering. For many cultures, their major city or village is the World Center. In Egypt, creation itself occurred when a primal mound rose from the Nile and became the cult center at Heliopolis. Delphi, home of the Greek oracle, was the navel of the world. Any village into which the people emerged from Mother Earth into this existence is the World Center, as in the case of many of the pueblo cultures in the American Southwest.

Most ancient and medieval cities were built around a central temple or church, often defined by walls with four gates representing the four directions. In a sense, then, cities were mandalas, representing wholeness and security and a sense that through the structure of the city, the inhabitants participated in that wholeness. In terms of collective psychology, cities have represented not only wholeness but a reasoned barrier against the chaos surrounding their walls. Cities were often

referred to by the feminine pronoun, and a constant fear was of the ravishing of the city by invading armies. In mythology, as in history, the fall of a city is a terrible tragedy equated with the psychological and emotional destruction of the culture. The fall of Troy is a prime model for this tragedy, its gates penetrated and its streets filled with the murdering invaders.

Cities, like humans, can be corrupted and can serve as a model for the psychological corruption of a people. A sphinx torments the sinful city of Thebes, and inside at its heart, we find the specific crimes of incest, regicide, and patricide in the person of Oedipus, who lacks the one psychological quality he needs, self-knowledge.

Cities sometimes have mythological, spiritual, and political significance related to particular events. As we know in connection with Jerusalem, a city can be holy to more than one people. Jews, Muslims, and Christians who have fought for the right to occupy that city have, from their points of view, fought for their cultural souls, for their very being. Take away Jerusalem and the people in question no longer are connected to what or whom they believe themselves to be. “By the rivers of Babylon, there we sat down, yea, we wept,” sings the psalmist of the Hebrew exile to Babylon and the destruction of Jerusalem. “If I forget thee, O Jerusalem, let my right hand forget her cunning” (wither away) (Psalm 137).

In the *Republic*, Plato discussed the city as an expression of our lack of self-sufficiency and our need to look for help beyond ourselves – i.e., in the collective experience. Ultimately, then, the city, whether Jerusalem, Troy, Athens, Thebes, or Heliopolis, is a mandalic model for a culture’s psychic wholeness, a model, like the heroes who defend it, of the collective self, the perfect union of the society’s psyche in both its unconscious and conscious forms.

Clergy Sexual Abuse

Konrad Joseph Noronha
Center for Pastoral Management, Jnana Deepa
Vidyapeeth, Pune, Maharashtra, India

The issue of clergy sexual abuse is real and relevant today. Awareness building is essential for prevention. Sexual abuse by individual priests is often varied, and the victims include both genders (Hansen 2015). Many organizational, psychological, and situational factors contribute to the susceptibility of individual priests to perpetrate abuse. It is important to note that no single cause of sexual abuse of minors by clergy has been identified as stated in the John Jay report (2004). Several causes or a combination of causes predispose clergy to abuse.

Clergy Offenders’ Personality Characteristics

Priest-abusers are likely to have experienced some of the following: Poor relationships with “their parents when they were youths” (Wong and Rossetti 2004, p. 14), a history of sexual abuse, isolation, loneliness, insecurity, poor social skills, lack of identity, confusion over sexual identity, psychosexual immaturity, and substance abuse (Stappenbeck et al. 2016). The transition from seminary to parish life may induce high levels of stress in some priests that can lead to higher levels of susceptibility to abuse. They may have served as stressors or triggers (Terry and Ackerman 2008). Stressors in the lives of clergy may lead to reactive behavior to relieve stress, such as high levels of alcohol use, which could in turn act to decrease inhibitions that allow abuse to occur.

During the peak years of abuse, the use of alcohol and drugs by abusive priests increased significantly. It is to be noted that homosexual orientation is not a significant predictor of sexual abuse of minors (Wong and Rossetti 2004).

The John Jay report (2004) also maintains that clergy offenders display shyness, loneliness, and passivity. Offending clergy exhibited the presence of over-controlled hostility more than non-offending clergy. One specific clergy study found that offenders came from backgrounds characterized by rigidity and dysfunction, with themes of abuse (Post et al. 2015). They had little insight into these areas, and had insufficient training in the issue of transference/counter transference, had virtually no training or education concerning sexual abuse, domestic violence, addictive disease, or healthy professional boundaries, and failed to appreciate how their history of trauma affected their professional life. Many clergy offenders who were studied psychologically showed some personality based markers on the Minnesota Multiphasic Personality Inventory (MMPI).

Psychological Tests

The John Jay report (2004) states that priests who had abused minors cannot be differentiated significantly on psychological tests from priests who had not abused minors. Nonetheless, there were several personality-based risk markers on the MMPI that merit attention. In clergy abusers, the MMPI primary scales show elevations on the subscales of denial of social anxiety, authority problems, persecutory ideas, amorality, and over-controlled hostility. Risk markers include need for affection, social imperturbability, imperturbability, and inhibition of aggression but these elevations are to be interpreted with caution.

Grooming Behaviors

Grooming behaviors are opportunities created by the abuser for the abuse to take place, such

as socializing and building trust with the victim's family. They include disproportionate attention, enticements, games, seduction, verbal and/or physical coercion. They also include seduction or manipulation, building of personal and family relationships, providing benefits such as drugs, alcohol, "verbal or physical intimidation, seduction and testing of a child, emotional manipulation and verbal coercion, catching the victim by surprise, using verbal or physical force" (Bettina Bohm et al. 2004, p. 8), and disguising sexual advances using alcohol and drugs.

Persistence of Abuse

Abuse persisted because the accused priests claim that they were compelled by sick or sinful impulses, were controlled by forces beyond their control, and so denied full responsibility for their behavior. They often denied the victim his or her status by claiming that the victim participated by being seductive or precocious, or did not fight back or say anything during the abuse. They even blamed the victim or the victim's family for setting up conditions that allowed the abuse to occur by inviting him into their home, engaging him socially, and including him as part of the family. They often downplayed the crime and explicitly blamed victims by placing the onus of the initiation of the physical intimacy on the accuser referring to the abuse as a relationship. They said that the victims were willing or precocious and considered themselves the victims because they were accused of these indecent acts. They viewed the sexual behavior as consensual, not harmful, and that any behavior short of intercourse as not wrong because it is not sex. They also insinuated that a single incident of sexual behavior was not harmful and that only repetitive acts caused harm. Some even said that the harm should be forgotten because of the time between the incident(s) and the accusation. They tended to explain their transgressions theologically.

Theological Misunderstandings by the Perpetrators

Priest-abusers explained their identity in relation to acts of abuse by using the image of sinner-self (Terry 2011). Their understanding of their sinfulness and the possibility of forgiveness in confession meant that after the Sacrament of Reconciliation, their relationship with God was restored, without reference to victims. It is only many years after the acts of abuse took place that they came to understand the impact of their behavior on victims. There was a cognitive dissonance that arose from the disconnect between the abusers' perception of norms of behavior, potential harms, and motivations for their own behavior, and the reality and the impact of their behavior. Adapting by justifying or excusing behavior allowed the abusive behavior to persist. They believed that seeking forgiveness from parishioners and victims and having completed some distinct punishment or treatment was enough to end the process of condemnation (Bange 2004).

Some priest-abusers stopped because of internal reasons, feeling guilty about their behavior, having a sense of remorse, and shame because of their behavior (Terry and Ackerman 2008). More commonly, abuse stopped because of external reasons, like being removed from the parishes and situations in which they could abuse. Others stopped because of a combination of internal and external reasons. The John Jay report (2004) states that no priest said that the vow of celibate chastity was the problem.

Prevention, Deterrence, and Treatment

Prevention policies in Churches should consider situational and social factors that could influence future harmful behavior, as new opportunities would arise over time, and offenders could adapt and change their *modus operandi*. Therefore, strategies should incorporate a general framework that can be adapted to new situations using new techniques.

Some measures could be to increase the effort it takes for priests to commit acts of abuse by implementing mandatory safe environment training to raise awareness among priests, and enforcing the zero-tolerance policy for abusers, which would make the risk greater if one is recognized as an abuser (Coughlin 2003). A periodic evaluation of the performance of priests, so that questionable behavior would be more likely to be detected and controlled, should be instituted (Wasserman 2017). Priests should acknowledge the importance of structures of accountability and transparency such as safe environment and audit programs. These should be implemented and maintained in a timely way (Rossetti 2004).

Priests should find alternate outlets for close and age appropriate bonds thus lessening the need for them to develop social bonds with adolescents. They should participate in priest support groups, which would decrease likelihood of isolation and stress. Stress-reduction seminars could help prevent provocations especially after transitions. Excuses could be reduced through education about what types of behavior are and are not appropriate with minors. The ability to use techniques of neutralization should be removed, whereby excuses to justify inappropriate behavior are given (Guerzoni and Graham 2015).

Conclusion

Priest-abusers blamed church leaders for the abuse and the Church's responses to the accusation. They shifted the blame to the Church hierarchy saying how poorly church leaders prepared seminarians for life in the priesthood, and how ineffectively Church leaders dealt with accusations of abuse, which they considered reactive and unforgiving. They felt they were poorly socialized to the life of a priest and if they were better equipped to adjust to the loneliness and realities of the life of celibate chastity, they might not have abused.

Therefore, change must come from the leaders in the Church, and the changes should be strongly implemented. Changes can be achieved through

transparency in reporting and dealing with sexual abuse. It should be ensured that transparency/accountability structures become routine and part of the ordinary practices and culture of dioceses. This may involve creation of review boards in parishes and dioceses. Thus, with continued transparency and accountability mechanisms in place, changes can become institutionalized.

Members of churches should be assured that the Church is committed to respond to all incidents of sexual abuse. Church members should be updated about steps taken to achieve changes through safe environment and audit programs and through gaining a better grasp of the problem by commissioning studies about the sexual abuse problem. They should be informed about how the church has acted. This would help in greater openness. Transparency requires that the whole church community be engaged at all levels, including laity and clergy, to maintain vigilance in the prevention of the abuse of children.

Clinebell, Howard

Jill Snodgrass
Loyola University Maryland, Baltimore,
MD, USA

Howard John Clinebell, Jr. (1922–2005) served as a pioneer of the modern pastoral counseling

movement. Clinebell was born in Springfield, Illinois, to Howard J. and Clem (Whittenberg) Clinebell on June 3, 1922. He received a B.A. from DePauw University in 1944, a B.D. from Garrett Theological Seminary in 1947, and a Ph.D. in Psychology of Religion from Columbia University in 1954. Clinebell completed the Certificate in Applied Psychiatry for Ministry from the William H. White Institute and was highly influenced by the work of Harry Stack Sullivan, Paul Tillich, David Roberts, Horace Freiss, and Carney Landis (Sanborn 1975). A minister in the United Methodist Church, during his studies Clinebell pastored churches in Indiana, Illinois, and New York. Beginning in 1955, he spent 2 years lecturing in religious education at New York University before moving across the country to Southern California. In 1957, Clinebell formed a pastoral counseling center at First United Methodist Church in Pasadena, California, and in 1959 joined the faculty of the School of Theology in nearby Claremont.

Clinebell commenced higher education toward the end of World War II, a time of shifting paradigms in American mental healthcare. The center of psychoanalysis moved to the USA from Europe. Freudian authority waned as neo-Freudian influences began to dominate psychological discourse. And the American public, with knowledge of “shell shock” from World War I, began to understand the insidious impact of mental illness upon aspiring and returning soldiers.

In response to this changing landscape, by the 1950s, over 80% of theological schools offered courses in psychology. Thus, Clinebell’s theological education at Garrett Theological Seminary and his training as a Methodist minister included instruction in both psyche and soul care. Influenced by Sullivan and this mental health milieu, Clinebell viewed “the individual (intrapsychic) and hence mental illness and health” as “abstractions when separated from the social (interpersonal) matrix of the individual’s life” (Sanborn 1975, p. 65). Aware of the impact of context upon the individual, Clinebell contended that the growth of one toward his/her “God-given potentialities” (Moss 1984, p. 175)

also contributed to the growth of others and the broader society. This precept led toward the construction of what Clinebell termed “growth counseling.” In an interview with Moss (1984), Clinebell defined growth counseling as “a human potential’s approach to the helping process that describes the goal as facilitating the maximum development of a person’s potentialities, at each life stage . . . Growth counseling is both a way of seeing people and a way of helping them” (p. 175). According to Clinebell, “GROWTH = CARING + CONFRONTATION” (Clinebell 1979, p. 55). Therefore, “Confrontation needs to focus on both negative, growth-limiting attitudes, beliefs, and behavior in persons and on the positive potential for change of which they are unaware” (Clinebell 1979, p. 55). Based on assets – rather than a deficits approach, growth counseling foreshadowed tenets found today within positive psychology, ecological counseling, and motivational interviewing. As noted by Kathleen Greider, Clinebell’s colleague at Claremont School of Theology, “Howard saw the need for counselors to understand how oppression and poverty wound a person” (Rourke 2005, para. 8). Thus, Clinebell was attuned to issues of race, class, gender, and ecology when many others in mental health broadly, and pastoral counseling specifically, remained focused on self-actualization devoid of systemic influences.

In addition to his work in the area of growth and growth counseling, Clinebell also wrote prolifically on the topics of well-being, ecoterapy, marriage, and addiction. Clinebell edited a volume of *The Journal of Pastoral Care* on the “Greening of Pastoral Care” in 1994, a time long before “going green” was so popular (Clinebell 1994). He wrote, contributed to, and edited over 30 books and more than 50 articles. He cowrote a significant number of books and articles with his wife, Charlotte Holt Clinebell. His work was translated into multiple foreign languages, including German, Spanish, Dutch, Finnish, Korean, Japanese, and Chinese, and he offered workshops in more than 60 countries. According to Mendenhall (1990), “His book *Basic Types of Pastoral Counseling* (1966, revised 1984), perhaps the most widely used

seminary textbook for pastoral counseling, helped expand the scope of pastoral approaches from individual/intrapsychic dynamics and non-directive methods to a more inclusive focus on interpersonal dynamics and more directive human potentials approaches” (p. 177).

As previously mentioned, in 1957, Clinebell formed a pastoral counseling center at the First United Methodist Church in Pasadena, California. After joining the faculty of the School of Theology at Claremont as professor of pastoral psychology in 1959, this center became the training institute for the school’s graduate program in pastoral counseling. Clinebell served as a faculty member at the school and pastoral counselor at the center from 1959 to 1988. During this time he traveled extensively, advancing the pastoral counseling movement across the globe and living out his commitments to justice, peace, and environmental ethics. Though the center underwent numerous name changes, from The Pomona Valley Pastoral Counseling Center to the Pomona Valley Pastoral Counseling & Growth Center, in 1989 the name was officially changed to The Clinebell Institute in recognition of his tremendous influence upon the discipline of pastoral counseling. Clinebell was a founding member and diplomate of the American Association of Pastoral Counselors and served as president from 1964 to 1965. He was also the founder of the International Pastoral Care Network for Social Responsibility.

Archives of Clinebell’s papers are housed at the Pitts Theology Library at Emory University as well as the library at Claremont School of Theology. In addition, as many of Clinebell’s books are now out-of-print, a number are available in full text at <http://www.religion-online.com>.

Howard J. Clinebell, Jr. and his wife Charlotte Holt Clinebell lived in Santa Barbara, California, until his death in 2005.

Clitoridectomy

Stefanie Teitelbaum

Faculty of National Psychological Association for Psychoanalysis (NPAP), New York, NY, USA
Institute for Expressive Analysis (IEA),
New York, NY, USA

Introduction

Clitoridectomy, or clitorrectomy, the removal of the clitoris, is a term and practice that is not mentioned in formal psychological or psychoanalytic literature. There is incidental mention in Western medical texts of women in Europe, America, and Australia in the nineteenth century subjected to psychosurgical clitoridectomy as treatment for hysteria and masturbation (Duffy 1963). These surgeries never became common practice. The significance of clitoridectomy is within Islamic religious and cultural tradition. The Qur’an does not mention clitoridectomy but there is a hadith, the oral transmission of the words and deeds of Muhammad, discussing the physical alteration of the female genitalia in

language unclear to both Arabic and English speaking people.

Religion

African Tribal Religions

Clitoridectomy predates Islam, in ancient African tribal religions. There is much debate as to which force, the old tribal or Islam, is the primary religious force in African female genital cutting (Badawi 1989; Roald 2001).

Islam

Clitoridectomy is one of several ceremonial procedures often referred to as female circumcision, female genital cutting, or female genital mutilation. This is a Sunni tradition, now debated among Sunnis. Shi'ites have never practiced female genital cutting.

The four procedures are differentiated (Roald 2001) as:

1. Circumcision, the removal of the prepuce or hood of the clitoris.
2. Clitoridectomy, the removal of the clitoris.
3. Excision, the removal of the clitoris and of all or part of the labia minora.
4. Infibulation, the removal of the clitoris, labia minora, and all or parts of the medial part of the labia major. Infibulation is practiced mostly in the Sudan.

In one of the earliest efforts of a scientific, systematic inquiry into practice and psychological impact of female circumcision, the phrase female castration first appeared. In his small sample of female circumcision in Egypt, none of the samples were circumcisions; all were castrations – clitoridectomy and excision (Badawi 1989).

The Arabic word, *bazr*, from the circumcision hadith, is alternatively translated as prepuce of the clitoris or the clitoris itself. The World Health Organization (WHO) classifies clitoridectomy as Type I Female Genital Cutting, including both circumcision and clitoridectomy, reflecting the

Arabic dual definition. The WHO Type I clitoridectomy subsumes both. Muslim opponents of all forms of female circumcision quote Holy Qur'an in their argument, saying that clitoridectomy alters Allah's creation and is the work of Satan. The strength and authority of the clitoridectomy hadith is questioned by Islamic clerics and scholars because "in Arabic language, two things or persons may be given one quality or name that belongs only to one of them for an effective cause (al-Awwal)."

Cultural Psychology

The psychological and psychosexual function of female clitoridectomy is also debated. Scholars, clerics, and women who have been circumcised and/or castrated speak of controlling sexual desire, enhancing sexual pleasure, limiting sexual pleasure, the rite of passage from childhood to adulthood, and even making the female genitalia more beautiful. Information about the psychological impact of clitoridectomy is also split; some are devastated, and some report enhanced self-esteem at being beautiful within a culturally defined beauty. Some women report frigidity, and some report increased sexual pleasure. There are reports of adult women who had sexual experience prior to clitoridectomy reporting no difference in sexual pleasure (Roald 2001). The split in psychological experience is blurred because of reporting circumcision and clitoridectomy as one category (Badawi 1989).

Commentary

Freud considered clitoral sexuality to be an infantile mimicry of male phallic sexuality, an expression of penis envy in the service of denying a woman's biologically determined identification as a passive, castrated being. To resolve her Oedipus complex, the girl must identify with her mother and reject the subsequent maleness of her clitoris. This is accomplished by the psychical

mechanism of decathexis or emptying of the clitoris' libidinal excitement in favor of the passive receptor of the vagina, thus fulfilling the destiny of feminine submissiveness that is determined by a woman's anatomy (Freud 1905/1953, 1924/1961, 1925/1961, 1933/1964). Freud's theory of female sexuality might be considered clitoridectomy by decathexis, or psychical atrophy, but most clearly a function of the unconscious. If Islamic clitoridectomy represents an externalization of unconscious fantasy, this kind of externalization happened within Freud's intimate circle. Princess Marie Bonaparte, a devoted friend and student of Freud's, subjected herself to a clitoral surgery to facilitate psychical decathexis and cure frigidity despite Freud's vehement objections. Bonaparte sought to do psychological research about excised women when she lived in Cairo during World War II, but was prevented from doing so by the Egyptian government (Walton 2001).

The concept of female castration anxiety and unconscious fantasy has been a topic of psychoanalytic inquiry which began during Freud's lifetime, challenging Freud's castration complex as being strictly male (Abraham 1920). The difference in unconscious fantasy and psychical structures regarding castration in Islamic women who have grown up with clitoridectomy in their collective cultural consciousness has not yet been explored. To do so at this time, utilizing Freudian-derived work on female castration would be imposing a Western lens on an Islamic unconscious. Clitoridectomy seems unquestionably repellent to the Western soul, and objective observations are easily swept away in passionate moralism and disgust. Vehemently supported and opposed within Muslim communities, the only seeming point of agreement about clitoridectomy is that the dilemma needs to be addressed within its own communities without Western interference or the imposition of Western sensibilities (Roald 2001). Today there are reconstructive surgical procedures available for female genital mutilation (Foldes et al. 2012).

Psychoanalytic theory postulates that male circumcision is experienced as symbolic castration (Freud 1909/1955). This unconscious confusion contributes to the difficulty of defining and signifying clitoridectomy as either circumcision or castration. The Freudian unconscious would not differentiate circumcision from clitoridectomy nor differentiate prepuce from clitoris, in parallel with the confusion of Arabic definition. East and West may need to return to God's covenant with Abraham, the circumcisions of Isaac and Ishmael, and follow the journey of those two circumcised boys to modern times to open a meaningful dialogue between psychology and religion about current-day clitoridectomy.

The word clitoridectomy does not appear in psychoanalytic literature, and the phenomenon is thus far unsignified in a psycholinguistic lexicon. In a Lacanian perspective, real meaning exists in the space behind the signifier and the absence of key signifier in a chain of signifiers creates a hole in the symbolic order leaving psychotic phenomena. The passionate madness surrounding clitoridectomy limits the dialogue between psychology and religion.

Cognitive Science of Religion

Dimitris Xygalatas

Department of Anthropology, University of Connecticut, Storrs, CT, USA

Interacting Minds Centre, Aarhus University, Aarhus, Denmark

The Cognitive Science of Religion (CSR) is an academic subdiscipline that studies the mental capacities and processes that underlie recurrent patterns of religious thought and behavior. The main focus of CSR is on unconscious processes such as thoughts, biases, emotions, and motivations. Unlike the related field of the Psychology of Religion, whose primary level of analysis is the individual, CSR is primarily interested in accounting for cultural forms and explaining why these particular forms are more widespread than others. Like Cognitive Science in general, CSR is interdisciplinary, employing theoretical perspectives and methodological tools from such diverse fields as religious studies; cultural, cognitive, and evolutionary anthropology; cognitive, developmental, and evolutionary psychology; philosophy; neuroscience; biology; behavioral ecology; history; and archaeology.

Given the interdisciplinary and pluralistic character of the field, there are ongoing debates over methodological priorities and theoretical positions. However, CSR scholars by and large agree on a set of basic overarching assumptions. First of all, religion is not a *sui generis* domain of the human existence and therefore can and should be subject to explanatory scrutiny just like any other cultural expression. Second, a scientific study of religion must necessarily adopt a position of methodological naturalism; religious explanations of religious phenomena cannot be taken to have any explanatory value in themselves. In line with evolutionary psychology, it is accepted that cultural forms are subject to the biological constraints of the human brain and the universal mental capacities of the human species, as they have

evolved through natural selection. In line with Cognitive Science, it is also accepted that the mind is not a blank slate nor a general-purpose computational machine but comes pre-equipped with a host of specialized mechanisms, each with a specific function. Based on these premises, cognitive scientists of religion are interested in exploring the causal mechanisms that might account for the recurrent patterns of religious beliefs and practices found around the world.

The Development of CSR

Although the mental underpinnings of religion had often been the focus of earlier research in the psychology, sociology, and anthropology of religion, a more concerted cognitive study of cultural forms was inspired by the cognitive revolution of the 1950s and especially by the work of Noam Chomsky (1957) on language. Chomsky argued for a psychological approach to language, aiming to specify the biologically hardwired principles of the mind that constrain the form of all natural languages. Soon thereafter, growing attention began to be directed to studies that focused on underlying commonalities rather than on surface variability of human traits and sought to uncover a “universal grammar” underlying the particular semantics of cultural phenomena. In the 1970s, Dan Sperber (1975) argued for a cognitive approach to cultural transmission, calling for attention to the psychological dispositions that underlie the formation and distribution of cultural representations, while Thomas E. Lawson (1976) and Frits Staal (1979) proposed a cognitive approach to ritual forms. The first comprehensive cognitive theory of religion was outlined by anthropologist Stewart Guthrie (1980), who argued that the origins of religiosity lie in the evolved human predisposition to attribute agency and intentionality to ambiguous inanimate objects and events in the environment.

Some of the field’s most important theoretical foundations were laid in the 1990s, with the work of Pascal Boyer (1992) on counterintuitive concepts, that of Harvey Whitehouse (1992), Thomas E. Lawson and Robert McCauley (1990) on ritual

transmission, and others (e.g., Deacon 1997; Donald 1991; Mithen 1996). CSR expanded exponentially shortly after the dawn of the new millennium, which brought both theoretical sophistication (Boyer 2002; McCauley and Lawson 2002; Whitehouse 2004) and institutional grounding (Xygalatas and McKay 2013). The consolidation of the field came with the founding of the International Association for the Cognitive Science of Religion in 2006.

Methods

CSR uses a wide variety of methods, ranging from ethnographic observation (Cohen 2007; Xygalatas 2012) and textual analysis (Slingerland and Chudek 2011) to brain studies (Cristofori et al. 2015; Schjoedt et al. 2011) and computer simulations (Nielbo and Sørensen 2012). Following an initial period of purely theoretical applications of cognitive perspectives to religion, CSR turned towards experimental hypothesis testing. However, since religion is inextricably linked with local contexts such as culturally specific meanings, sacred places, etc., many aspects of religiosity cannot easily be studied in the laboratory. To deal with this problem, CSR scholars also turn towards naturalistic experiments to provide empirical data while addressing both sides of the cognition and culture continuum. These studies have used a variety of methods such as physiological measurements (Fischer et al. 2014; Xygalatas et al. 2013b), facial expression analyses (Bulbulia et al. 2013), contextual primes (Xygalatas et al. 2015), economic games (Sosis and Ruffle 2004), or various combinations thereof.

For example, in one such study (Konvalinka et al. 2011; Xygalatas et al. 2011), researchers used heart rate monitors to measure physiological arousal at a Spanish fire-walking ritual, where participants crossed a bed of glowing-red coals. The results revealed synchronous arousal between performers and observers of the event, despite the fact that the ritual did not involve any motor synchrony. In addition, the degree of the alignment in heart rate patterns could be predicted by

Cognitive Science of Religion, Fig. 1

A study of a Spanish fire-walking ritual revealed that the ritual created collective effervescence, which was measured as heart rate synchrony

the level of social proximity, suggesting that physiological and emotional synchrony were not merely the effect of mirroring but were also mediated by social familiarity (Fig. 1).

Key Topics

Some of the main topics in CSR research address the following questions:

How did religion come about? Some CSR scholars see religion as an evolutionary by-product. For example, according to Stewart Guthrie (1980), religion is a by-product of our innate tendency to overdetect intentionality in nature. This tendency is an adaptive trait that evolved to allow us to detect predators and prey, but it also makes us susceptible to seeing faces in the clouds and gods on toasted bread. Similarly, Boyer and Liénard (2006) see ritualized behavior as a by-product of an adaptive cognitive system aimed at precautionary behavior. Other CSR scholars, however, consider that religion evolved to serve specific adaptive functions such as eliciting prosocial behavior and promoting cooperation (Sosis 2003), while others argue that both models can coexist within the framework of Dual Inheritance Theory (Atran and Henrich 2010).

What does religion do? Irrespective of how it arose, religion undoubtedly has significant effects

both for individuals and society. For example, the long-standing assumption that ritual may be an intuitive response to anxiety was tested by Martin Lang and his colleagues (2015), who found that inducing anxiety led people to engage in ritualized behavior. Similarly, CSR scholars are investigating the effects of religion on morality (Shariff et al. 2015; Xygalatas et al. 2013a). Overall, this research suggests that although religious disposition plays little role in moral behavior, religious situation does have prosocial effects (Norenzayan and Shariff 2008).

Are we natural-born believers? Developmental studies in CSR examine when religious beliefs are formed and how they develop over the course of the lifespan. For example, there is evidence that children from very early ages tend to see purpose and design in the natural world (Kelemen 2004). Furthermore, research suggests that dualism (the idea that body and mind are two independent entities and that the latter can survive the death of the former) also comes naturally to children (Bering and Bjorklund 2004).

What makes religion successful? Dan Sperber (1996) proposed a selectionist model in which religious ideas proliferate because they successfully trigger innate human psychological biases that constitute attractors in the cultural evolutionary landscape. Pascal Boyer (1992) has argued that the most successful religious concepts are

those that tend to be “minimally counterintuitive,” violating just enough of our intuitive expectations to be exciting and more easily remembered. Finally, other scholars discussed the role of ritual by identifying a bimodal distribution of ritual practices, one relying on frequency and the other on arousal for the successful transmission of belief and praxis (Whitehouse 1992; Lawson and McCauley 1990).

Cohesion

Christos Orfanidis
Aristotle University of Thessaloniki,
Thessaloniki, Greece
University of Toronto, Toronto, Canada

Cohesion in a social context can be defined in various ways depending on the scientific background of the researcher. Social cohesion has

inspired many scholars from the beginning of many fields, mainly social psychology and sociology. Today, both fields suggest that cohesion does not just describe the social bonding of members of specific groups, community segments, or societies, but an array of more complicated structural, psychological, and biological processes.

Throughout history, religion has played both the role of a stimulus of cohesiveness and that of a power of deviance. We can study cohesion in different levels of analysis, such as the micro (group), the meso (community), and the macro (society). In order to understand the relational interactions of religion and cohesion, we should take into consideration all possible levels of analysis due to religion's multivariable visibility and forms of expression.

This chapter aspires to examine how cohesion works in religious groups and how religion produces or eliminates cohesion in societal approaches. The chapter comprises all three levels of analysis, and a particular emphasis is given on the cohesive function of rituals, a part of yesterday's and today's scholarship with a great interdisciplinary psychological interest.

Group Cohesiveness

Group cohesion is the phenomenon of cohesiveness that has been tested the most. Researchers have attempted to define its reasons of appearance as well as its consequences. Inside a (religious) group, the participating social subjects share common aims. Sherif and Sherif (1969) have interwoven in-group cohesion with the mutuality of need satisfaction. Group members co-develop a cooperative interaction, which emits structural vigor and attractiveness, attaining the participative maintenance of members. Interpersonal attractiveness (Lott and Lott 1965) as well as group attractiveness as a whole (Hogg 1992) was argued to be responsible for group cohesion itself.

The sense of we-ness and the need of belonging drives group members to be cohesive, as Bollen and Hoyle (1990) state. Membership in a

specific group can cause identity fusion, that is, when a social identity becomes an essential component of our personal self-concept (Swann et al. 2012) and since social identities are essential parts of a social subject's self-concepts, physiological arousal of the individual translates into pro-group action (Swann et al. 2009). As a general result, performative rates arise, due to the greater motivation of each team member (Beal et al. 2003). Nevertheless, many social groups tend to be multireligious and generally aims tend to differ on a multilevel scale, potentially interrupting overall cohesion.

Ritual and Cohesion

When it comes to group cohesion and religious scholarship, a chapter of paramount significance and long standing tradition is that of the cohesive functionality of ritual. Recent scholarship has focused on the connections of individual sacrifice and the collective cohesiveness affiliated with ritual behavior. Specifically, rituals that involve exposure to high levels of pain, energy expenditure, as well as any other form of personal sacrifice signal commitment to group values (Xygalatas et al. 2013). These personal sacrifices are translated as shared experiences among the group members, promote social cohesion, and empower the longevity of the social groups (Whitehouse and Lanman 2014).

An in-group performed ritual, though, can have effects also on inter-group cohesiveness, depending not only on the level of sacrifice, but the frequency as well. More specifically, Harvey Whitehouse (2013) distinguishes the rare traumatic rituals that are typical of small religious groups from the high-frequency routinized religious rituals that are typical of established world religions. The first ones contribute to intense relations of trust and tolerance within small religious groups but also in terms of out-group hostility and intolerance, while high frequency routinized rituals do not directly establish trust and toleration of the in-group in a great manner.

Community and Societal Cohesion

Macrosocial approaches of cohesion generally tend to be more theoretical, due to the impracticality of ultra large data empirical research and the need of wide coverage and multicomplex inclusion, accomplished mainly through reductionism. From the twentieth century, Durkheim (1995 [1912]) saw the *totem*, which in the end is the community itself, as a collective representation of the group that stimulates *collective effervescence*.

Although the complexity that characterizes today's multicultural societies indicates the necessity of new paradigms, Durkheim has provided us with an interesting theoretical framework for community cohesion, which has inspired many scientists. More detailed, he labeled two contrasting forms of social cohesion as *mechanical* and *organic* solidarity (Durkheim 1995 [1912]). Mechanical solidarity can be vastly found in small societies organized into equivalent segments due to collective conscience, while organic solidarity occurs in large societies divided into specialized organs, united not by likeness but by mutual interdependence in a division of labor (Durkheim 1997 [1893]).

In late modern societies, religion seems to have lost the attribute of collectivity and became a matter of personal choice, an individual subject (Hervieu-Léger 2006). However, it still remains a spectral phenomenon penetrating to every aspect of private and public life. Especially in the public sphere, fundamentalism and extremism, among others, have rendered religion to be seen as a social institution of conflict. Long-sustained conflict in social institutions weakens society's overall cohesiveness as well as the social capital it produces, due to the society's inability to provide the sense of stability and predictability (Bruhn 2013).

Therefore, phenomena of extremism and terrorism claiming religious reasons can drive cohesion in turmoil. For instance, Islamic actions have stigmatized the members of the referring religious community, promoting community and societal deviance, particularly the phenomenon called Islamophobia, and governmental policies must be developed to strive to

(re-)establish social cohesion (Alam and Husband 2013).

Coincidentia Oppositorum

Hillary S. Webb

Goddard College, Portsmouth, NH, USA

God as Unity and Multiplicity

According to fifteenth-century cardinal, mathematician, and mystic Nicholas Cusanus (also referred to as Nicholas of Cusa and Nicholas of Kues), the *coincidentia oppositorum* – or “coincidence of opposites” – constitutes the “least imperfect” name for God and was the means by which humanity could achieve religious toleration and, ultimately, world peace. Cusanus’ concept of the *coincidentia oppositorum* later influenced the work of a number of Western scholars, most notably Carl Jung, the founder of analytical psychology, who considered the psyche of each individual to likewise be a coincidence of opposites – a blend of conscious and unconscious elements which together constitute a harmonious and unified whole called the “self.”

Nicholas Cusanus (1401–1464) has been called “the first modern philosopher” (Bond 1997, p. 17) in part because of the era in which he lived but perhaps more importantly because he is considered responsible for heralding a new stage in the deconstruction of language and epistemology. Unlike most of the Christian theologians of his time who held a monotheistic vision of God as a supernal power that exists independent of the physical world of existence, Cusanus stood out as a controversial figure because of his

belief that God does not exist separately from creation but rather is both transcendent of and immanent within it – a simultaneous *unfolding* of oneness into multiplicity and the *enfolding* of multiplicity within the one.

[W]hen I am at the door of the coincidence of opposites, guarded by the angel stationed at the entrance of paradise, I begin to see you, O Lord. For you are there where speaking, seeing, hearing, tasting, touching, reasoning, knowing, and understanding are the same and where seeing coincides with being seen, hearing with being heard, tasting with being tasted, touching with being touched, speaking with hearing, and creating with speaking (Cusanus 1997a, pp. 252–253).

Because God is infinite and absolute, Cusanus argued all things in existence are aspects of God, without which God would not be adequately represented. For Cusanus, this concept had not just theological significance but social implications as well, for he believed that it was the inability to accept all forms of religious worship as a necessary reflection of God that was the cause of humanity's most devastating conflicts. He felt certain that if people were educated to the truth of this idea, humanity would recognize its ultimate unity, and there would be perpetual peace.

But, as he bemoans in *De Visione Dei* ("On the Vision of God"), "How can the intellect grasp you, who are infinity? The intellect knows that it is ignorant and that you cannot be grasped because you are infinity. For to understand infinity is to comprehend the incomprehensible" (Cusanus 1997b, p. 258).

The "Least Imperfect" Name for God

For years, Cusanus struggled to find a way of describing his vision of God as both a unity *and* a plurality and an infinitude *and* a finitude. In what was perhaps his defining work, *De Docta Ignorantia* ("On Learned Ignorance"), Cusanus considers the difficulty of "naming" God, for – due to the limitations of reason-driven language – there is not one name that is not opposed to another. If one describes God as "this," it implies

that God is not "that." However, since God is everything, there is nothing that God is not. For example, to call God "absolute" implies that God is not "not absolute." Therefore, Cusanus argued, any description for God must acknowledge and reveal its own limitations, for since God is everything, there is nothing that God is not. Because of this, many of the names that Cusanus used included linguistic contradictions such as "One-and-All" and "All-in-One."

In 1453, on his way home from Constantinople where he had gone with the hope of reuniting Eastern and Western Christendom, Cusanus claimed to have had a mystical vision in which he conceived of the "least imperfect" name for God: the *coincidentia oppositorum* or "coincidence of opposites." The *coincidentia oppositorum* was not a description of God, Cusanus insisted, but an explanation of how God works. That is, God was not *the* coincidence of opposites but rather *a* coincidence of opposites.

Although branded as a heretic by some of his contemporaries, Cusanus and his use of the name *coincidentia oppositorum* as a way of describing the simultaneous plurality and unity of the absolute had, and continues to have, a profound influence on the work of later Western thinkers. Religious historian Mircea Eliade used the term frequently in his work, citing the *coincidentia oppositorum* as being a representation of "man's deep dissatisfaction with his actual situation, what is called the human condition" (Eliade 1969, p. 122) and of humankind's "nostalgia for a paradoxical state in which the contraries exist side by side without conflict" (Eliade 1969, p. 122).

The Psyche as Coincidentia Oppositorum

Within the discipline of psychology, the *coincidentia oppositorum* found its most prominent articulation in the work of Carl Jung, the founder of analytical psychology. For Jung, the *coincidentia oppositorum* became a kind of meta-archetype to describe the workings of the human psyche, which he saw as being made up of binary

oppositions such as conscious-unconscious, anima-animus, and persona-shadow.

Like Cusanus, Jung devoted himself to tackling the problem of opposites. But while Cusanus focused his attention on the social and religious implications of this idea, Jung emphasized its use as a symbol for the “self” – the core essence and totality of the psyche. The self, Jung wrote, “can only be described in antinomian terms” (Jung 1968a, Vol. 9, Pt. 2, p. 63) for it is the dialectical unity of “both ego and non-ego, subjective and objective, individual and collective. It is the ‘uniting symbol’ which epitomizes the whole union of opposites” (1966a, Vol. 16, p. 265). Jung believed that all psychological imbalances (such as neurosis, addiction, and various dissociative disorders) represented a “self-division” (Jung 1966b, Vol. 7, p. 20) – a state of disunity with oneself due to this war between various processes within the psyche. “The self is made manifest in the opposites and in the conflict between them; it is a *coincidentia oppositorum*” (Jung 1968b, Vol. 12, p. 186), he wrote. The individual would not be whole until these opposing parts were brought into harmony within the self. Jung believed that psychological healing could be achieved through the ego’s confrontation with and ultimate reconciliation of the “shadow” aspects of the unconscious. Only by doing so could one begin to withdraw projections and integrate the seemingly antithetical aspects of one’s personality into a single, indivisible unity or whole. He called this process “individuation.”

More recently, the *coincidentia oppositorum* as a symbol of both spiritual and psychological transcendence has been highlighted in the work of the contemporary philosopher Ken Wilber (2001), as well as others in the field of transpersonal psychology.

Collective Unconscious

John Ryan Haule

C.G. Jung Institute Boston, Chestnut Hill,
MA, USA

In Jungian psychology, collective unconscious is the totality of inherited potentials or the full complement of archetypal patterns that are universally human. In addition to ego-consciousness lies all the forgotten material of an individual’s lifetime (called personal unconscious) as well as the vast reservoir of

latent possibilities that belong to the human species (collective unconscious).

Many popular discussions of the collective unconscious give the mistaken impression that it is a sort of storehouse of images or even a memory bank for everything that has ever happened in the course of the world. Jung insists that it is not images or memories that are inherited but rather the capacity to recognize, imagine, and enact typically human patterns of thought and action. The collective unconscious is best understood as the sum of all the behavior patterns we inherit with our DNA: the capacity to learn and speak a language, for instance; the propensity to fall in love, form lasting bonds, and propagate; the set of aptitudes for nurture and mothering; and so on. Thus, the seemingly effortless facility that very young children show for distinguishing linguistic patterns in the conversations going on about them, as well as for assimilating a huge vocabulary and the grammar to organize it. Such inborn facilities for language illustrate several aspects of the collective unconscious: (1) an inherited capacity to recognize relevant stimuli in the environment; (2) the motor capacity to reproduce sounds and gestures in order to communicate; (3) the possibility of combining those typical acts, ideas, and images in countless ways; and (4) the fact that all typically human patterns take on cultural variations, as the language capacity will become specified as the mother tongue of Japanese, Arabic, or English. On the basis of the collective unconscious, we recognize typical forms of human behavior when we encounter them, intuitively know how to respond, and also know how to enact them ourselves.

We not only enact the archetypal patterns of the collective unconscious; we also use them – or, more accurately, use the capacity to recognize and to imagine such patterns – consciously or unconsciously to reflect upon our lives. The evidence for such acts of imagination and their effects upon us when we encounter them are to be found in, among other things, literature, philosophy, theology, and dreams. Some dreams seem to be nothing more than variant retellings of the events of the previous day and can be understood without reference to the collective

unconscious. Others that refer to crises, challenges, and life transitions, however, may be expressed in imagery that seems archaic, numinous, uncanny, and impersonal. These are images and themes in which the typically human patterns of the collective unconscious (archetypes) emerge relatively free of personal associations and take on mythic significance.

All of evolution is implicitly present in the collective unconscious, for it not only gives human beings a common foundation that accounts for the survival of our species and forms the basis by which we naturally understand and relate to one another but it also connects us with our primate cousins, who are also highly social beings who groom one another to form friendships and also cultivate “political” alliances for personal and communal advancement. Indeed, since the collective unconscious represents the sum of our inherited capacities, it links us to every DNA-bearing creature on earth. Jung imagined peeling the unconscious like an onion until he arrived at the psyche of an amoeba upon reaching the center.

The narratives of myth and the constructs of theology all express, in one way or another, the fundamental realities of the collective unconscious. Indeed, because they originate in that domain of the psyche which all humans share, such doctrines and stories move us deeply and seem to be eternally true. Religious rites, ceremonies, and rituals are also expressions of the collective unconscious that automatically engage the psyches of all participants, bring them into harmony with one another, and generate altered states of consciousness within which some of the originating ideas and aspirations of the tradition can be reexperienced in the present by each individual.

Communal and Personal Identity

John Ryan Haule
C.G. Jung Institute Boston, Chestnut Hill,
MA, USA

Personal identity, one's own individuality, is a relatively late acquisition – both in life and in human history – and in its best sense not at all to be taken for granted. It is, in fact, an achievement, given the powerful influence of socializing pressures promising acceptance and support at the price of conformity. Personal identity emerges from communal identity only with effort and often longs to return. Sometimes personal identity changes and grows as an individual moves from one communal identity to another.

Emergence of the Personal

Human life begins within the mother and is so thoroughly dependent upon her bodily processes that a nascent human psyche can hardly be

expected to distinguish its own experiences from those governed by the bloodstream and nervous system of its fleshly environment. Total dependency continues after birth in a different form, where the life, language, and customs of the family environment provide the socially interpreted world within which the infant's consciousness is fostered and shaped. The smiling, babbling, exclaiming protolanguage shared by caregiver and infant is the foundation not only for language learning but also for sociocultural indoctrination. A child begins to discover its individuality somewhat later, as disappointments and conflicts provoke conscious awareness of oneself and the unique otherness of each human mind.

As adults, we live in an environment that is tacitly structured by socially favored ideas, images, and assumptions which go largely unnoticed and uncriticized. They are implicit in the news and entertainment media, in casual conversations, in notions of politeness, etc., forming a collective consciousness that is taken for granted and that shapes even one's private thoughts. At bottom, communal identity is governed by a condition of participation mystique that provides security and belonging. Ritual and myth enact and articulate this largely unconscious foundation of communal identity.

Rites of Passage

In “traditional societies” – a loose phrase that describes communal life as it has been practiced over the vast course of human history – communal identity is ritually and mythically differentiated into life stages separated by rites of passage related to birth, maturity, reproduction, and death. For example, childhood ends with puberty rites that provide the individual with a new adult identity and role in society. The consequences of such rites shape the daily lives and experiences of every member of a community. While the newly defined adult steps directly and finally into communally established responsibilities and roles that belong to maturity, every other member of the community must relate to the new initiate as to a full-status adult; all

interactions and expectations that concern that individual will have changed.

Rites of passage change a person's social identity but always within a larger communal identity. True individuality is perhaps only possible in a more complex social world like that of the modern West, where communal identity in the traditional sense is no longer possible and where individuals are exposed to a variety of social customs, religious traditions, and the like, thereby revealing the less-than-absolute authority of any of them. Much of the meaningfulness of human existence is lost in the disillusionment that comes with modernity; one symptom of which is the longing to return to a simpler time with clearer definitions of what is right and wrong. Hence, the recent rapid growth in fundamentalist religions.

Cultural Differences

Although modernity is disruptive, it lays down a challenge as well; for in the world as it exists today, religiously defined communal identities are no longer effective for most people. Consequently, each individual must find his or her own mythic foundation in the sense of what Jung has called one's "personal myth" and Kohut has described as "the self's nuclear program." Real personal identity is not a pose like individualism and not to be found in following fads. Rather, it is discovered as one's own meaningful relationship to the universally human themes of the collective unconscious.

The tension between communal and personal identity may be quite different in the East, for many studies have shown that the Western model of individuality is not shared by the East. In the West, it is commonly said that the squeaky wheel gets the grease, whereas in the East it is said that the nail that sticks up will be pounded down. Similarly, figure/ground studies of picture interpretation have shown that the central figure in a scene is not perceived in the East as standing out from and opposed to the ground as it is in the West, but rather as standing in dynamic relationship with the ground. Evidently therefore, in the

East, communal identity is far more important than personal identity.

Religions of the Dispossessed

Individuals and minorities within a society that have been labeled as deviant or irrelevant have historically reacted to their exclusion from an honorable membership in their society by reinterpreting the symptoms of their unworthiness as signs of election to subgroups that pursue ecstatic experience – often direct experience of the spirit world through possession trance. Some 90% of worldwide societies have one or more institutionally recognized form of pursuing altered states of consciousness, while 74% have possession trance religions that offer an honorable communal identity to individuals whose personal identity is viewed as inadequate by the larger community. As a consequence of such new membership, their personal identity is potentially transformed and made honorable, although it must be pointed out that, again, such an individual's communal identity is stronger than her personal identity. (Women, for reasons of gender discrimination, are more apt to become trance mediums than are men.)

Evidence shows, however, that all societies have used religious rituals to alter the consciousness of their members at least since the Upper Paleolithic and very likely much further back in human history – indeed, ritual behavior has also been documented in primates in the wild. Communal rituals draw individuals together into an emotionally satisfying group identity and are also used to reduce suspicions and hostilities between groups that need to cooperate with one another on behalf of common goals.

Communitas

John Eric Killinger
The Intermundia Press, LLC, Warrenton,
VA, USA

Introduction

From the Latin, *communis* (community, fellowship, condescension, affability), various meanings of *communitas* (a term taken up under the aegis of the Roman Catholic Church traditions) include joint possession in the hands of a religious community, stockbreeding society, land subject to rights of common, the whole of the clergy and the people, common property tax in mass, sworn association, urban commune, the commonality of the inhabitants of a city having the status of a

commune (especially in connection with a military expedition), the Commons (estate of the realm), and the common people. This Latin term was taken and developed by cultural anthropologist Victor Turner (1920–1983) to describe a society during a liminal period that is unstructured or rudimentarily structured with a “relatively undifferentiated comitatus, community, or even communion of equal individuals who submit together to the general authority of the ritual elders” (Turner 1969a, p. 96).

The Moment and Marginality of Communitas

Communitas is a “moment” in or out of secular structure. It seems to be possessive of an effervescence, making this moment one of religious creativity. One is reminded of the troubled waters in the Pool of Bethzatha in John 5: 2–9 (Aland et al. 1998, pp. 259–260). Turner’s work with *communitas* often goes hand in hand with concepts of pilgrimage, although recent anthropological studies on pilgrimage such as Eade and Sallnow (1991/2000) take issue with this idea with regard to pilgrimages to Lourdes. Nevertheless, it must not be overlooked that Turner’s work has greatly influenced countless anthropologists and the deepening of psychological understanding of human beings. The acquired sacred component in liminal space proffers a suitable container for empathic holding of woundedness and the bringing of notions of the divine into shared consciousness. Even such work with psychoid realms as that of Raff (2000) indicates the creation of *communitas* for those undergoing the process of individuation.

Communitas emphasizes the marginal, the alien, the alien foreignness of ourselves (Kristeva 1989/1991). It is the emptiness at the center that can only be identified or apprehended through its hybridization, or in-betweenness, with social structure. Communitas, like liminality and hybridity, is often subjunctive in mood; that is, it thrives in the imaginal world of possibility rather than concretized fact. As a threshold, it possesses an immediacy akin to Bergson’s *élan vital*. One

moves from structure into *communitas* and back to structure with renewed vision. Vision quests, *rites de passage*, contemplative prayer, spiritual retreats, and fasting are all part of the anti-structure of *communitas*; however, their purpose is to redirect, reframe, and revision the structures in which we live. *Communitas* is therefore viewed as cyclic, placed in a dialectic with structure in such a way that the revolutionary quality of *communitas* is summoned and participated in, structure is reentered, and *communitas* is summoned again.

Turner's Differentiations of Communitas

Turner (1969b) differentiates three types of *communitas*. The first of these, existential (or spontaneous) *communitas*, is often approached in the form of a "happening," or noteworthy event typically involving audience participation.

A second type of *communitas* Turner designates as normative. This occurs when the spontaneous or existential *communitas* is organized into a lasting social system. Such a system might include a religious sect, such as the Branch Davidians, Heaven's Gate, and millenarians. As with any structuring of movements, *communitas* tends to lose its anti-structural quality as it grows more organized as in, for example, an institution.

The third form of *communitas* is ideological. This is a utopian model based on existential *communitas* that can be expressed as an outward form of an inward experience of a happening. This is not unlike the question of the Westminster Larger Catechism (Office of the General Assembly 2002), "What are the parts of a sacrament?" to which the catechumenate replies, "The parts of a sacrament are two: the one, an outward and sensible sign used according to Christ's own appointment [the water of baptism and/or the bread and cup of the Lord's Supper (eucharist)]; the other, an inward and spiritual grace thereby signified" (p. 223). We could then say with Turner that structure is pragmatic and this worldly, whereas *communitas* is speculative and generates

imagery and philosophical ideas. Taken further, if psyche is image, *communitas* is soul-making.

Turner's spontaneous/existential *communitas* is equated with the community of Martin Buber's (1947/2002) "essential We" or the I-Thou relationship built up in community. Tribal rites, vision quests, or other forms of invoked *communitas* are not for seeking the pleasurable company of relationship. Rather, in invoking *communitas* one is seeking transformative experience that goes to the root or core of a person's being in a profound and shared (even sharable) fashion. Psychoanalysis as a sort of *communitas* rationalizes Lacan's (2005) recognition in 1974 of the triumph of religion as a triumph of structure over movements. It is why he retorts that psychoanalysis will be around for a while longer as there always needs to be a revolutionary component.

Providing optimal occasions for *communitas* are life in the fringes, interstices, and margins of structural forms. *Communitas* can also arise from inferiority, described as coming from beneath structure. The ability to give free rein to imagination, entertain, and hold the doubts, mysteries, and uncertainties of negative capability also provides the circumstances of and for *communitas*. This works well for individuals, but not necessarily for groups that consider themselves in situations of *communitas*.

Communitas occasionally is associated with visions or theories of world catastrophe. Examples of such perceived catastrophic consequences of *communitas* include the People's Temple led by Jim Jones, the frenzy of the Y2k transition, and millennialist religious cults, sects, etc. Despite the infrequency of catastrophic associations with *communitas*, there remains the danger of severe discipline, the circumciser's knife (as in the establishment of a mark of the divine's chosen in the story of Abraham's near sacrifice of Isaac).

There is the *communitas* of withdrawal, of retreat. This form of *communitas* involves partial or total withdrawal from participation in the social structures of the world. Examples include Jesus the Nazorean, the Buddha, the Prophet Muhammad, Gandhi, Nietzsche's Zarathustra, and even the Rose-beetle man of Gerald Durrell (1956/1984). Vision quests, hermitage, and retreat are

also types of the *communitas* of withdrawal. Curiously, such examples as these either have a connection with or are possessed by the numinous.

Communitas offers a number of benefits. Among these mentioned by Edith Turner (2004) are joy and healing, the gift of “seeing,” mutual help, the experience of religion as religion – not just Jewish, Muslim, or Christian, for instance, but *religion* – and the gift of knowledge (*gnosis* as opposed to gnosticism). Other attributes might include long-term ties with others as others, a humanistic conscience that supports, uplifts, accepts, sustains, and celebrates all of humanity (not just a small portion of it), and the ideals of human rights.

Communitas becomes structural when, like grace or the bestowal of favors, it becomes routinized. Turner (1974) notes the similarity between structural *communitas* and Freud’s repetition compulsion. Expressions of routinized *communitas* include monasteries, convents, initiation camps, and communes.

Not unlike the scholastic notion of *haecceity* (Duns Scotus) or the individuation process of Jung, *communitas* preserves individual distinctions. Despite sharing the same cognate with *communio*, *communitas* is not the same as communion because there is no merging. It’s more akin to synchronicity. It is not realizable, for it is a force, a dynamic. Turner (1987) argues that *communitas* is not being realized because “individuals and collectives try to impose their cognitive schema on one another” (p. 84).

Communitas is finally analogous, according to Turner (1983/1987), with flow, owing this understanding to the world of positive psychologist M. Csíkszentmihályi. In this understanding, action and awareness are one, and Turner observes that there is no flow when we are aware that we are engaged in the act of flowing. As long as structural rules and framing crystallize out of the flow rather than are imposed upon it from without, *communitas* can be observed as taking place. *Communitas* is then viewed as an imaginal framework, a third space container suitable for an *Einfühlung* (a feeling into something) of holding, viewing, and bringing of notions of the divine into shared consciousness.

A Critique of Communitas

The theory of *communitas* has recently been critiqued (Eade and Sallnow 1991/2000) in its associations with the practice of pilgrimage. The criticism argues that if aligned with pilgrimage, *communitas* is presented as a model of determinism, and this Eade and Sallnow see as limiting the usefulness of *communitas*. Sallnow’s assessment is that “the most helpful, pre-analytic image to hold in mind is a tangle of contradictions, a cluster of coincident opposites” (p. 52). This assessment would align itself with the idea of the alchemical *massa confusa* (aka *prima materia*) and the concept of synchronicity, components the importance of which Turner acknowledges throughout his work. Another problem they view is that in identifying pilgrimage as *communitas*, a spurious homogeneity is imposed upon pilgrimage, prejudging its complex character as a phenomenon. While not finding fault with the value of the theory of *communitas* per se, Eade and Sallnow opt to neglect its capacity for and maintenance of negative capability that itself seems intrinsic to the pilgrimage experience. Instead, they replace negative capability with the power of religious hierarchies to determine the outcomes of pilgrimage. A rebuttal in the form of reminding us that this critique is simply a return to structural *communitas* is given by Edith Turner (2004).

Despite the recent critique of *communitas* with regard to pilgrimage, it should be understood that *communitas* as anti-structure really means it is an inversion of the normal. In this respect, we are open to the play and fascination of mirrors as apophatic third eyes. *Communitas* thus extends our gaze, including our backward gaze or regard. We are negatively defined – not contradicted – as *neti...neti*: neither this nor that. We are thus opened up to new experience and meaning-making such that we can work and play well with others as we see ourselves as others, too.

Compassion

Krystyna Sanderson

The Blanton-Peale Institute, New York, NY, USA

The word compassion comes from Latin *com-* (with, together) plus *pati* (to bear, suffer). Compassion can be defined as “deep feeling for and understanding of misery or suffering and the concomitant desire to promote its alleviation” (Paiano 1999, pp. 1–291). Another source describes compassion as “the capacity to be attracted and moved by the fragility, weakness, and suffering of another” (Downey 1993, p. 102).

Compassion in the Bible

The Hebrew word for compassion, *rehamim*, refers to the womb or uterus. Just as the womb is the source of biological human life, so God’s compassion is the source of life itself. God acts as a womb, and the place of birth is the vehicle of compassion (Trible 1978, p. 55). Psalm 103 names compassion as a paternal attribute of God: “As a father has compassion for his children, so the Lord has compassion for those who fear him.” And Isaiah 46:3–4 portrays God as a mother bearing the house of Israel.

The Christian Gospel refers to the coming of Christ as an act of God’s compassion (“For God so loved the world. . .” – John 3:16). In the story of the feeding of the 4000, Jesus says, “I have compassion on the crowd, because they have been with me now 3 days, and have nothing to eat; and if I send them away hungry to their

homes, they will faint on the way; and some of them have come a long way” (Mark 8:2–3). Compassion is given a high priority in the parable of the Good Samaritan: “But a Samaritan, as he journeyed, came to where he was; and when he saw him, he had compassion, and went to him and bound up his wounds, pouring on oil and wine; then he set him on his own beast and brought him to an inn, and took care of him” (Luke 10:33–34). The parable of the Prodigal Son also highlights compassion: “And he arose and came to his father. But while he was yet at a distance, his father saw him and had compassion, and ran and embraced him and kissed him” (Luke 15:20).

Compassion in Psychotherapy

Psychotherapists and psychoanalysts must first look at their own suffering before they can join their patients as fellow sufferers and participants in the individuation process. The psychotherapist has to be compassionate toward self in order to be compassionate toward the patient. One’s own suffering can help one to soothe the suffering of another.

Genuine compassion is clearly differentiated from pathological symptoms that can mimic compassion but are only disguised forms of narcissism, projective identification, inverted envy, or even masochism, sadism, or apathy.

Freud

Compassion clearly plays a major role in psychotherapy and psychoanalysis, but already in 1911 Freud had identified a hazard in the natural tendency of the analyst to frame, define, and resolve the issues emerging in the course of therapy. Instead, the therapist should exercise *evenly suspended attention*, not imposing his own feelings and interpretations on the proceedings. “If he follows his expectations,” Freud wrote, “he is in danger of never finding anything but what he already knows.”

Jung and Kohut

Jung’s *unprejudiced objectivity* and Heinz Kohut’s *vicarious* introspection express related concepts. Jung believed that suffering is unavoidable and that what matters is how one responds to suffering. He saw acceptance of suffering as paramount in the developmental process that he called individuation.

Rogers

Carl Rogers’ *unconditional positive regard* addresses more directly the exercise of compassion in the therapeutic context. In Rogers’ view, it is not enough for the therapist to be a nonintrusive partner to the therapy. The therapist must *care* for the client with an active, positive concern. Such active concern, Rogers believed, created the most favorable setting for the client to employ their own internal resources for personal growth.

Both in psychological and theological terms, compassion gives suffering meaning and purpose and is a vital connection between personal relationships and the relationship between the individual and God.

Compassion Fatigue

Storm Swain
Lutheran Theological Seminary at Philadelphia,
Philadelphia, PA, USA

General Overview

“Compassion Fatigue” is a term given to the secondary stress suffered by those in the helping professions who are working with those suffering from trauma.

Pioneering theorist Charles Figley notes that “There is a cost to caring” (Figley 1995, p. 1). This cost or risk has been variously called compassion fatigue, secondary traumatic stress (Stamm 1995/1999), or “vicarious traumatization” (McCann and Pearlman 1990). It has also been associated with therapeutic countertransference (Pearlman and Saakvitne 1995).

Figley, who has been publishing on Traumatic Stress in families and the military since the late 1970s, writes, “Caring people sometimes experience pain as a direct result of their exposure to other’s traumatic material. Unintentionally and inadvertently, this secondary exposure to trauma may cause helpers to inflict additional pain on the originally traumatized. This situation – call it compassion fatigue, compassion stress, or secondary traumatic stress – is the natural, predictable, treatable, and preventable unwanted

consequence of working with suffering people” (Stamm 1995/1999, pp. 3–4).

Figley prefers the use of compassion fatigue or compassion stress as the “most friendly term for this phenomenon” (Stamm 1995/1999, p. 17). It is of note that this term, as compared with secondary traumatic stress or vicarious traumatization, focuses on the impact on the empathy of the caregiver, whereas the other two focus on the origin of the traumatic stress.

One of the earliest uses of this term comes from the nursing profession, where Carla Joinson described “situations where nurses had either turned off their own feelings or experienced helplessness and anger in response to the stress they feel watching patients go through devastating illness or trauma” (Yoder 2010).

One can see in this brief description the two strands of the phenomenon – the empathic relationship and the environment.

The symptoms of compassion fatigue described in the early literature parallel that of the Diagnostic and Statistical Manual of Mental Disorders (DSM) category of “Post-Traumatic Stress Disorder” (PTSD): “A state of tension and preoccupation with the individual or cumulative trauma of clients as manifested in one or more ways: re-experiencing the traumatic event; avoidance/numbing reminders of the traumatic event; persistent arousal; combined with the added effects of cumulative stress (burnout)” (Figley 1995, p. 11).

A later more popular description notes “In simple to understand language, compassion fatigue is the ‘cost of caring’ of working with victims of trauma or catastrophic events that shows itself as spiritual, physical and/or emotional fatigue and exhaustion” (Roberts and Ashley 2008, p. 209).

This reflects both the evolution in the term and the tension of keeping clinical parameters with diagnostic categories not included in the most current DSM. Fleeting lapses in empathy for a parishioner, patient, or client; infrequent flashbacks to a traumatic story triggered by an association; and exhaustion after a particularly stressful day or week may be common for many in the helping professions. However,

like PTSD, compassion fatigue is not simply characterized by the symptoms of re-experiencing *and* avoidance or numbing *and* arousal but by the number of symptoms, intensity, duration, and how they may affect one's quality of life and ability to work, study, and engage in relationships.

This is further complexified by the relationship between the original trauma of the parishioner, patient, or client and the secondary trauma of the caregiver. PTSD defines two criteria of the traumatizing event that causes the disorder: "the person experienced witnessed, or was confronted with an event or events that involved actual or threatened death or serious injury, or a threat to the physical integrity of oneself or others" *and* "the person's response involved intense fear, helplessness, or horror" (American Psychiatric Association 2000). One would think this would be true also for someone witnessing this secondarily through the narrative of a patient, parishioner, or client. It is of note that the current revisions for the upcoming DSM V are indicating that the latter criteria will be dropped and replaced by significant distress in the re-experiencing category. However, the criteria for the traumatizing event are tightened to the exposure to actual or threatened death, serious injury, or sexual violation that is direct or witnessed in person or one learns of the threat to a family member or close friend.

This highlights both the complications in defining what can be seen as an increasingly popular pseudo-diagnostic category and also the confusion and complexity with multiple nomenclature that each reflects a different part of the phenomenon.

Unlike the other descriptions for secondary traumatic stress disorder and vicarious traumatization, compassion fatigue appears simply to emphasize the exhausting nature of the disorder, which may draw from the criteria of arousal, avoidance, and negative changes to mood or thoughts, rather than those of intrusive re-experiencing. This tension, however, has been reflected and contained in the tests that have been formulated to indicate the probable presence of

compassion fatigue, such as the Professional Quality of Life (ProQOL) tests.

Brenda Hudnall Stamm who has published, collaborated, and continued the work of Figley in this area since 1995 states explicitly that "Neither Vicarious Traumatization nor Compassion Fatigue are synonyms of PTSD or a mental disorder. (Figley and Roop 2006; Pearlman and Caringi 2009; Stamm 2006, 2010a). . . . Compassion Fatigue is not a diagnosis" (Stamm 2012, p. 1). She states "Compassion Fatigue breaks into two parts. The first part concerns things such as exhaustion, frustration, anger and depression typical of burnout. Burnout may have a gradual onset and reflect a sense of helplessness or assessment of ineffectiveness in your work" (Stamm 2010a, p. 12). Secondary traumatic stress (STS) is "work-related secondary exposure to people who have experienced extremely or traumatically stressful events. The negative effects of STS may include sleep difficulties, intrusive images, or avoiding reminders of the person's traumatic experiences" (Stamm 2010a, p. 13). Unlike burnout STS may have a rapid onset. Stamm also notes an additional factor which may mitigate the effects of compassion fatigue, that of compassion satisfaction: the positive feelings associated with being able to help others and the ability to perform effectively, work collegially, and contribute to society.

The ProQOL Test assesses compassion satisfaction and the two components that Stamm cites for compassion fatigue – burnout and secondary traumatic stress. Some theorists in the fields of mental health debate the relationship between burnout and compassion fatigue. Patricia Potter et al. suggest that these sometimes ambiguous terms are closely related but different. "Definitions of burnout more often have environmental stressors, whereas definitions of compassion fatigue address the relational nature of the condition" (Potter et al. 2010, p. E56). Jenkins and Baird (2002) suggest a "useful distinction" between burnout and secondary traumatic stress. Despite these questions the ProQOL or some form of either Figley's or Stamm's early compassion fatigue self-administered tests are almost universally used to assess compassion fatigue. The use of such a test may indicate whether someone may

be suffering from burnout alone, secondary traumatic stress alone, or, cumulatively, compassion fatigue.

There is a growing body of research on compassion fatigue in a number of helping professions – nursing, psychiatry, social work, psychotherapy, and disaster response; however, research with religious professionals is still somewhat limited.

Research suggests that 9% of clergy are at extremely high risk for compassion fatigue through the stresses of their daily ministry (Darling et al. 2004). These stressors may include personal and family criticism, boundary ambiguity, and presumptive and unrealistic expectations of parishioners (Lee and Iverson-Gilbert 2003). Spiritual well-being was seen to “mediate the relationship between stress and compassion fatigue” (Proeschold-Bell et al. 2011). From a United Kingdom context, Hendron et al. simply state “The vocation of clergy life can be a hazardous journey” (Hendron et al. 2012). These stresses are exacerbated by congregational conflict, financial stress, social isolation, and long work hours (Morris and Blanton 1994). Due perhaps to both liturgical and pastoral roles, research in the early 1980s indicated that clergy are often sought out five times more than all other mental health professionals combined in the face of bereavement and grief (Veroff et al. 1981). In discussing Jewish Rabbis, Bonita Taylor notes they “respond to individuals who have been exposed to a wide range of stressors, including criminal assault, rape and robbery, spouse abuse, child abuse, life-threatening illness, severe mental illness, assisted suicide and euthanasia, and human-created disasters, such as Holocaust death-camp survivors” (Taylor et al. 2006). Clergy are often turned to in the face of national disaster or involved in disaster response, such as that of the terrorist attacks at Oklahoma City and of September 11, 2001. *The New England Journal of Medicine* suggests that 90% of Americans used clergy as a coping resource after the 2001 attacks (Shuster et al. 2001).

A couple of studies on compassion fatigue in clergy who responded to the 9/11 terrorist attacks

focus of the impact of deployment with a single organization, such as the American Red Cross family assistance and respite centers and the mortuaries or voluntary chaplaincy at multiple sites, which may include church respite centers, and denominational disaster response organizations (Flannelly et al. 2005; Roberts 2003). Of note, contrary to what might be expected regarding intense exposure to victims who had suffered the threat of or witnessed sudden death of others, families who feared the potential and probable death of a loved one, and working alongside those recovering human remains that may occasion horror, helplessness, or hopelessness, Roberts found that persons that worked for the American Red Cross alone, with time-limited shifts and structured emotional defusing practices, suffered *lower* levels of compassion fatigue than those who had not been involved in this disaster response. Those that worked with other organizations were assessed as having the highest risk of compassion fatigue (Roberts 2003, p. 758). The research highlights issues of the necessity of not only good individual self-care but structured self-care practices that emphasized good boundaries, limiting work hours and exposure to traumatizing factors rather than over-extending them, and the necessity of interventions that connect clergy to others rather than isolate them. Later analysis of the same data led Flannelly, Roberts, and Weaver to discern that chaplains who spent higher than average number of hours working with trauma victims and a greater number of days spent doing so showed increased risk of symptoms of compassion fatigue and burnout. However, these were mitigated in those who worked for the American Red Cross and/or had taken at least one course of Clinical Pastoral Education (Flannelly et al. 2005). Swain’s (2011) qualitative research on chaplains who worked at the temporary mortuary at Ground Zero in New York after September 11 also notes the impact of chaplain’s self-care and spiritual practices and the transformative aspects of humor, the care of the disaster response community, and the association to what was held to be sacred in the disaster response.

Treating and Preventing Compassion Fatigue

Charles Figley notes that compassion fatigue is both preventable and treatable. He also emphasizes the necessity of awareness, warning those engaged in empathic work with trauma victims of their vulnerabilities to compassion fatigue and of strategies to mitigate the effect of trauma. Noting that empathy is a major resource in the helping professions, he also notes that unresolved trauma in the caregiver's own life will increase vulnerability, as will working with children and other vulnerable populations (Figley 1995, pp. 15–16).

For religious professionals, and others in the helping professions, the primary way to mitigate the effects of compassion fatigue is to practice self-care that includes (a) supervision or other defusing, debriefing, and problem-solving strategies; (b) maintaining a sense of “connectedness” with peers, with ecclesial or professional bodies, with those outside the sphere of their work: family, friends, and children; and (c) maintaining or developing a “reflective self-focus” (Roberts and Ashley 2008, pp. 212–213). Such a focus may range across the biopsychosociospiritual spectrum from using massage and relaxation techniques to personal counseling or psychotherapy to formal or informal prayer, liturgy, meditation, reading sacred texts, and journaling. The former strategies call attention to the necessity of being in relationships where one is the recipient of care and the empathy of others and not constantly the caregiver and those social relationships where one is not always “on the job.” Additionally attention to life-giving transformative experiences, practices, relationships, and to one's relationship to the Divine can increase a sense of compassion satisfaction in such a vocation that can not only offset “the cost of caring” but build resiliency and lead to the possibility of post-traumatic growth. Figley suggests “5:1 ratio rule,” which involves 1 h of personal processing for every 5 h of engagement with traumatic cases (Figley 2002, p. 215). Such personal processing can range from informal conversations “over a beer off duty” (without tolerating substance abuse) to post-shift defusing and group debriefings (p. 215)

and for the religious professional or volunteer, the resources of spiritual direction, pastoral psychotherapy, and clinical pastoral supervision.

Charles Figley notes that the first step in treating compassion fatigue is being aware of it, through undertaking self-test that assesses the degree of risk. He commends the comprehensive “Accelerated Recovery Program for Compassion Fatigue” (ARP) of Gentry, Baranowsky, and Dunning (Figley 2002, p. 213). The ARP program facilitates a recovery process which they call “The Road Back Home” (p. 126). Originally designed for five individual sessions, the program has been further developed into a group models of 1-day intensive and 3-day retreats at the request of caregivers involved in the Oklahoma City disaster response. This “powerfully interactive and introspective” program (p. 128) includes components such as building a therapeutic alliance, a variety of assessment tests, anxiety management techniques, the use of narrative, exposure techniques drawn from behavior therapy to resolve secondary traumatic stress, cognitive restructuring, and a “self-directed resiliency and aftercare plan” (pp. 129–130) which builds professional and resilience skills, self-management and care skills, connection with others, and attention to internal and external conflict management (p. 130).

Compassion fatigue in the context of this article is rooted in the empathic relationship with the other for whom we are called to care. Care for the caregiver here is care for the client. Compassion fatigue, rather than simply denoting the empathic “feeling with” the other, etymologically indicates the risks of *com passio*, “suffering with the other.” In professional helping relationships, such a risk includes an ethical demand to care for the self so that the reverse does not become true and that the client, patient, or parishioner begins to either bear or suffer the effects of our suffering.

Complex

Craig Stephenson

Le Presbytère, Mondion, France

Etymologically, the English word “complex” derives from the Latin *complexus*, “embrace” or “sexual intercourse,” from *complecti*, “to entwine,” made up of the prefix *com* meaning “together” + *piectere*, meaning “to braid.” In the natural and social sciences in general, the word “complex” denotes a system composed of interconnected or related parts that, coming together as a whole, manifest one or more properties not evident from the properties of the individual parts. In mathematics, a complex number consists of a real and an imaginary part, either of which can be zero. In psychology, complexes are organized groups of ideas and memories that are, for the most part, outside awareness but that carry enormous affective power when activated, their presence significantly altering the psychic system as an entwined or braided whole.

Even though Freud and Breuer use the term “complex” in their early studies of hysteria, Laplanche and Pontalis, writers of the seminal *The Language of Psychoanalysis*, attribute its theoretical importance in psychoanalysis to Jung’s studies in word association. Freud regarded Jung’s empirical investigations with complexes (measured as delayed responses to stimulus words as well as by psychogalvanic response) as an important experimental corroboration of his theoretical concept of the unconscious. But Freud increasingly shunned the term “complex” after Jung and Adler placed complexes at the center of their theories as natural phenomena. That is to say, orthodox Freudian psychoanalysis regards complexes, including Freud’s Oedipus complex, as symptoms resulting from failed acts of repression, whereas Adler’s individual psychology and Jung’s analytical psychology do not theorize complexes as synonymous with neurosis.

Adler employs the concept of a complex to account for psychological strategies such as the “will to power” and self-aggrandizement which

individuals adopt often to avoid difficult feelings of inferiority. Jung characterizes conflicts between ego consciousness and other complexes as painful but not necessarily pathological: “A complex becomes pathological only when we think we have not got it” (Jung 1942/1954, para. 179). For Jung, a feeling-toned complex is an image to which a highly charged affect is attached and which is incompatible with the habitual attitude of the ego. Often attributable to a trauma that splits off a bit of the psyche or to a moral conflict in which it appears impossible to affirm the whole of one’s being, a complex is a splinter psyche that behaves with a remarkable degree of autonomy and coherence, like an animated foreign property within the sphere of consciousness. It can override will or volition and block memory; that is to say, the individual ego is relatively powerless in a conflict with an unconscious complex. In his essay, *A Review of the Complex Theory*, Jung explicitly describes this as “a momentary and unconscious alteration of personality known as identification with the complex,” although the opposing phrase “assimilation of the ego by the complex” could just as appropriately convey the action (Jung 1934/1960, para. 204).

Freud extended the work of Charcot and Janet with regard to hysterical symptoms when he realized that complexes as symptom-producing ideas rooted in unconscious affects needed to be abreacted. But Jung argues that psychoanalytic theory does not adequately convey the power and the positive potential of these symptom-producing ideas. Jung portrays Freud as wanting to unmake as illusion, to reduce to a psychological formula, what Jung describes in psychological terms as a “complex” but also, at other times, as a “spirit,” “god,” or “daimon.” And Jung argues that his theory contributes to and corrects psychoanalytic theory by emphasizing the inherent ambiguity of complexes which the ego experiences as negative: “Spirits are not under all circumstances dangerous and harmful. They can, when translated into ideas, also have beneficial effects. A well-known example of this transformation of a content of the collective unconscious into communicable language is the miracle of Pentecost” (Jung 1920/1960, para. 596). Jung employs a

deliberately equivocal language of psychological “complexes” that are also “spirits,” in order to honor their ontological claim as un-lived potentialities of the personality. These forcefully seek to incarnate in time and space and kinetically push the individual psyche towards a more genuinely integral organizing or entwining of its parts, a process which he calls “individuation.”

Jung argues that the technique of personification provides a psychotherapeutic means by which the ego can free itself from the affective power of an unconscious complex. In his memoirs, as well as in his theoretical writings, he describes his experiments with the personified image of the complex. Jung observes that if, rather than simply suffering the active complex’s often difficult affect, we deliberately enter a state of reverie and permit the complex to manifest spontaneously to conscious awareness as a personified image, then we depotentiate its power over ego consciousness and make interpretation possible:

The essential thing is to differentiate oneself from these unconscious contents by personifying them, and at the same time to bring them into relationship with consciousness. That is the technique for stripping them of their power. It is not too difficult to personify them, as they always possess a certain degree of autonomy, a separate identity of their own. Their autonomy is a most uncomfortable thing to reconcile oneself to, and yet the very fact that the unconscious presents itself in that way gives us the best means of handling it. (Jung 1962, p. 187)

Hence, an important component of psychotherapy focuses upon supporting the ego of the patient within the frame of the transference-countertransference relationship to the point that it can experience the autonomy of the unconscious complex as a splinter psyche and eventually reconcile itself to the contradictions inherent in psychic reality through a personified confrontation and meeting. Jung depicts the images and affects of a complex as clustering around an archetypal core which is both ambiguous and numinous. As a result, an archetypal aspect of the experience of the otherness of the psyche may cause the analytical container to feel tinged with numinosity. As contradictory as this may seem, in order to address contemporary mental disorders cast in the secularized language of “mind” and “complexes,” the

practice of psychotherapy needs to take into account a religious function in the experience of healing.

Post-Jungian theorists detach Jung’s definition of the religious function in psychotherapy from connotations of an esoteric system of belief. At the same time, they defend it from classical Freudian interpretation that sees it as a component of transference phenomena which constitutes resistance and an obstacle to the process of healing. Jung’s concept of synchronicity provides an important framework for understanding the numinous aspect of complexes experienced within clinical settings which is otherwise professionally considered taboo and for considering the interaction of religious and scientific imagery. This is important because there are potential risks within the transference – and for the therapy in general – when the religious dimension of psychotherapeutic practice either is not processed consciously but acted out in the transference and countertransference or is only interpreted reductively, that is to say, as infantile and illusory. Jung argues that psychotherapeutic healing depends on the degree to which the therapist carefully considers the implications of this religious function when the otherness of unconscious complexes manifests in the *temenos* of the therapeutic encounter.

Extrapolating from Jung’s theorizing, James Hillman’s archetypal psychology suggests that, by taking into account the inherent multiplicity and pluralism of the psyche, Jung’s theory of complexes compensates for the dangers inherent in the one-sidedness of modernist Western cultures and the Western practice of an ego-oriented psychology of self-development. The personification of unconscious complexes provides an effective means by which one adopts the paradoxical position of, on the one hand, claiming the personified aspects as one’s own and, on the other hand, experiencing their distinctness from ego consciousness and their autonomy. Furthermore, psychological complexes demand a dramatically engaged and lived response to the unconscious as other, in contrast to intellectualizing and conceptualizing unconscious contents which will not be psychotherapeutically effective.

Whereas psychiatry associates personification with the irrational and pathological hallucinatory phenomena of dissociative identity disorder and psychosis, Jung normalizes it as a natural psychological process through which complexes manifest. This process is comparable to what psychiatrist Laurence Kirmayer, in his review of cognitive research on dissociation (1994), designates as a component of “reverie.” Indeed, Kirmayer (1999) describes the recent psychotherapeutic work of Witztum and Goodman precisely in terms of split-off aspects of the self which are experienced as supernatural entities and spirits. Witztum and Goodman report that patients, addressing their suffering through reverie and a manipulation of symbols rather than through abreaction and reductive developmental-based work, effectively reorganize cognitive schemas, unconscious dynamics, and interpersonal interactions.

Jung’s theory of complexes proposes a looser definition of personhood than Western thinking traditionally promulgates. Jung describes this theoretically in terms of “the serious doubt [which the existence of complexes throws] on the naïve assumption of the unity of consciousness” (Jung 1934/1960, p. 96) and also personalistically in the last words of his memoirs wherein he acknowledges “an unexpected unfamiliarity with myself” (Jung 1962, p. 359). When psychoanalysts such as Goldberg (1980, in Samuels et al. 1986, pp. 32–35) write that “a person is a collective noun,” they affirm Jung’s theory of complexes, of a multiplicity of conscious mental functioning, as well as aligning contemporary psychoanalytical theorizing with current research into the inherent dissociability of normal cognitive functioning.

Compulsion

Dianne Braden

Inter-regional Society of Jungian Analysts, Solon, OH, USA

Etymology

The noun, compulsion, generally means the state or experience of being compelled. It is the irresistible urge to act, regardless of the rationality of the motivation. In its verb form, compel expands qualitatively to include meanings such as force, drive, constrain, and sway. It comes from the Latin verb *pellere* (past part. *pulsus*), meaning to push, drive, or strike. The extended form *pelna* comes

from the Latin verb *appellare*, to drive to, address, entreat, appeal, or call. Each and all of these contribute to psychological and religious interpretations of compulsion.

Elaboration

Compulsion, referring to repeated, irrational action (distinguished from obsession involving repetitive thought), is a phenomenon that by its very nature bridges more than one domain. Although this experience is neither exclusively physical, psychological, nor spiritual, it manifests powerfully and problematically as all three. As a physical experience, compulsions fall under the category of addictions of all kinds. Specialists in substance abuse disorders range in focus from alcohol, drugs, food, gambling, shopping, sex, love, and relationship; and this list is not exhaustive. Caught in a compulsive cycle to reexperience the original pleasurable exposure to the substance, people become trapped in a whirlpool of cyclical agonies. In spite of negative consequences, the compulsion to repeat a certain action dominates the will of the individual and a pattern of predictable, yet irresistible actions follow.

In the realm of psychology, Sigmund Freud's first observations about compulsion include the curious desire in the psyche to repeat experience even though the return to it could not possibly be pleasurable (Gay 1989, p. 602). Referring to this as the "repetition compulsion," Freud noted that his earlier thinking surrounding the seeking of pleasure and the avoidance of pain could not explain a need to revisit experiences that cause suffering.

Object relations theorists and analysts focused on the internal objects in the psyche and addressed compulsions as rooted in the inescapable desire to possess, reject, or relate to the object. Michael Balint talks about artists and performers of all kinds as ultimately serving a need to be seen by and thereby possess the object (Balint 1959). This gives new meaning to the saying that "the show must go on." Perhaps the need of some of the great painters, like Claude Monet, who painted more

than 100 paintings of the lilies, answered a similar call.

But it was Carl Jung who first ventured into a spiritual understanding of compulsion's dynamics, thinking first that certain compulsions bore witness to a lack of moral restraint. While early therapy met with such compulsive behaviors more confrontationally than is acceptable today, Jung touched on the necessity of the analytic relationship to challenge a moral deficit. "Unless the doctor and the patient become a problem to one another, there is no cure" (Jung 1961, p. 142).

Later, and more specifically, Jung addressed the problem of alcoholism in a letter to one of the founders of Alcoholics Anonymous. He had come to see compulsive drinking as a spiritual quest of deep proportions, a destructive cycle without the possibility of cure if there is no spiritual component to the recovery (Adler and Jaffe 1972 pp. 623–625).

Compulsion thus spreads its wings over the physical and the psychological and now reaches into the spiritual experience of the "call." Religious history the world over describes the individual compelled to move beyond their ordinary circumstances to take up the demands of a larger existence. St. Francis of Assisi quit the trappings of nobility and a career-driven life to minister to the poor. His devotion to the faith revealed to him in a series of visions moved him to the founding of a new religious order and later canonization. Joan of Arc would have died an obscure French peasant had she not heeded the voices of saints that came to her in a vision, "calling" her to lead her country's army to victory against the British after the 100 Years' War. Compelled, surely beyond reason at the time of the Inquisition, Joan held to her beliefs and was burned at the stake for following a compulsive service to a larger authority.

Compulsion presents a dilemma in terms of how to view it. For some, perhaps it is no more, nor less, for that matter, than the physical experience of addiction. Based on a compulsive need to re-experience the initial pleasure, the negative consequences are outweighed by even the hope of finding it. For others, perhaps it is a psychological coping mechanism to manage anxiety over

the loss of the original object. Or at depth, compulsions herald movement toward an enlargement of the personality. And finally for others, compulsion could answer a larger call of divine proportions, a response to a certain kind of destiny that effects the larger community and culture (Braden 2008).

Confession

Morgan Stebbins

Faculty of the New York C.G. Jung Foundation,
New York, NY, USA

The act of confession either begins a process of reparation or affirms the subject's relationship with the transpersonal. That is, one can confess wrongdoing or confess one's faith. In most religious traditions, the former is accomplished through ritualized admission, absolution, and repair, while psychologically it begins the formation of therapeutic trust and unburdens the subject of poisonous secrets. The confession of faith can occur at moments of trial (martyrdom), or of ritual inclusion (initiation), and in the secular world can take the form of moral statements or even

scientific stances which are determined by unconscious assumption rather than a rational or integrated practice (see especially Nietzsche 1992).

The word confess is made up of the Latin *com* (together) and *fateri* (to acknowledge), indicating that a process of change begins both *with* another person and by *admitting* that which is in error. A confession of faith can be seen as an acknowledgment of a relationship with the transpersonal. Both modes experientially parallel the psychoanalytic encounter.

In the Catholic tradition, penance is a sacrament of the New Law instituted by Christ in which forgiveness of sins committed after baptism is granted through the priest's absolution to those who with true sorrow confess their sins and promise to rectify them. The whole process of confession is referred to as a “tribunal of penance,” because it is seen as a judicial process in which the penitent is at once the accuser, the person accused, and the witness while the priest pronounces judgment and sentence. The church father Origen is explicit: “[A final method of forgiveness], albeit hard and laborious [is] the remission of sins through penance, when the sinner . . . does not shrink from declaring his sin to a priest of the Lord and from seeking medicine, after the manner of him who say, ‘I said, “To the Lord I will accuse myself of my iniquity””’ (Origen, Homilies on Leviticus 2:4 [CE 248]). The Council of Trent (*Session Fourteen, Chapter I*) quoted John 20:22–23 as the primary scriptural proof for the doctrine concerning this sacrament, but Catholics also consider Matt. 9:2–8, 1 Cor. 11:27, and Matt. 16:17–20 to be among the Scriptural bases for the sacrament (The Catholic Encyclopedia). This multilevel mediation of sin can be thought of, psychologically, as the careful exploration of the scripture, or transpersonal psychic reality, inscribed in the mind of a patient and read, through translation of the symbolic material, into an analytic session.

Protestant sects in general disavow the necessity of an intermediary between the faithful and God so that confession is a matter of a sincere admission of wrongdoing in prayer and the asking of forgiveness. In practice this also can occur in a communal and ritualized form during service or to

another person if he or she has been wronged by the sin committed. Jung interpreted this historical move away from mediation as quite precarious, since most people did not (and do not) have the necessary strength of character and interior conceptual equipment to directly encounter and live with the transpersonal, whether characterized as an archetypal unconscious, an instinctual inclination, or a social movement such as a political ideology or a new age spiritual system. Typically a subject without firm mediation is either overwhelmed by a psychic flood or reverts to some type of collective response but without the benefit of *knowing and choosing* the system.

Various sutras encourage the Buddhist to confess to someone who is able to receive the confession (usually a superior in the temple or a monk). The confessor should at a minimum understand the ethical precepts and ideally should have some experience in following them. The point of confession is to *experience remorse* and to reflect on the consequences of one's actions in order to *exercise* restraint in the future. In practice this results in a sense of relief. Confession does not absolve the Buddhist from responsibility for the actions committed. The *karmic* consequences of such actions will still manifest.

The following story illustrates the relative nature of confession in Buddhism (Sāmaññaphala Sutta – DN 2, various translations, but see also Macy 1991). The king Ajattasattu had killed his mother and father and has usurped the crown. His conscience bothered him, and so he went to confess to the Buddha. The Buddha said to the king: “Indeed, King, transgression [*accayo*] overcame you when you deprived your father, that good and just king, of his life. But since you have acknowledged the transgression and confessed it as is right, we will accept it. For he who acknowledges his transgression as such and confesses it for betterment in future, will grow in the noble discipline.”

The word *accayo* means “going on, or beyond,” and in the moral sphere means acting outside the established norms – so transgression is quite a good translation. However, once the king departs, the Buddha says to the monks: “The king is done for, his fate is sealed, bhikkhus. If the king

had not killed his father. . . then as he sat there the pure and spotless dhamma-eye would have arisen in him” (Walsh 1995, p. 91ff). So it is quite clear that there is no hope for the king regardless of how many cycles of life he uses to work off his karma. Psychologically we can understand this as the harsh but all too common experience that some people are not going to get better (whatever the definition of getting better might be), regardless of treatment or effort. There is also in this story the aspect of appropriate teaching, meaning that for each listener, the king, the monk, and the reader, there is something quite different to integrate.

In Islam, confession in the sense of declaration of faith is very central, being one of the five pillars of Islam. Distinct from this is the act of seeking forgiveness from God, called *istighfar*. Confession of sins is typically made to God and not man (except in asking for forgiveness of the victim of the sin). It is one of the essential parts of worship in Islam. This act is generally done by repeating the Arabic words *astaghfirullah*, meaning “I seek forgiveness from Allah.” Again we can see that a concept of relationship between the subject and the transpersonal is central and that the locus of authority rests in the latter. This attitude is in stark contrast with the social and economic norms for most populations at this point in history.

In Judaism, like Islam, confession is an important part of attaining forgiveness for both sins against God and another man. In addition, confession in Judaism is done communally in plural. Unlike the Christian “*I have sinned*,” Jews confess that “*We have sinned*.” An early form of this confession is found most directly in Daniel 9:5–19, especially verses 5, 9, and 18–19, where the supplicant acknowledges himself meritless and asks for God's forgiveness based only on God's own merit and that God's name should not be tarnished among the nations.

For Jung, confession was the first of four stages or levels of the analytic process. In some cases, confession is all that is needed for a complete resolution of suffering, and it would be merely a personal agenda for the psychoanalyst to push beyond that. In other words, embedded in the symbolic material is a moral imperative specific

to the movement of psyche itself, and it is this that forms the psychological imperative. However, if the analyst detects that further exploration is needed according to the symbolic communication from the psyche of the patient, Jung outlines three more stages of education, elucidation, and finally transformation (Jung 1955).

Confession appears quite universally in religious traditions (this includes tribal cultures not specifically discussed, as presented, e.g., in the journal *Mental Health, Religion and Culture*, May, 2007), so we can safely translate it as the psyche's need to both orient itself in terms of interpersonal and social norms (because another person is necessary and often the mistreated party must be addressed as well) and relate to those areas of transgression against the transpersonal center of meaning. For the latter, it is seen as critical that this practice of relating happen in a dyadic manner and in a protected environment. In this way the journey of insight and integration begins.

Confidentiality

David Lee Jones

Austin Presbyterian Theological Seminary,
Austin, TX, USA

Confidentiality refers to the cultural expectation and legally protected right that the privacy of all persons' thoughts, conversations, feelings, writings, correspondence, and personal effects will be honored, guarded, respected, and protected. In Western society and culture, persons have a reasonable expectation and legal right that personal information will be kept private by clergy, pastoral counselors, therapists, chaplains, social workers, psychologists, psychiatrists, and other medical and mental health professionals.

Confidentiality assumes that persons have the right to choose when and to whom personal information may be disseminated and that permission (usually in writing) is expected. Shah (1969, 1970) notes that the purpose of confidentiality is to guard and protect persons from unauthorized disclosure of information without informed consent.

Aside from its ethical, moral, and legal ramifications, confidentiality is also understood as essential to the counseling process of establishing trust; maintaining a professional, ethical relationship; and providing a safe and positive environment that is critical to therapeutic growth and healing. Nearly all established helping professions have clearly articulated requirements of confidentiality in their respective codes of ethics.

Federal and state regulations also have their own legal statutes and exceptions regarding confidentiality. For example, mandatory reporting of child abuse is a well-established exception to confidentiality. Additionally, many jurisdictions require that helping professionals break confidentiality in cases where persons threaten to harm to themselves, others, and sometimes property (i.e., suicidal, homicidal, or terroristic ideation). It is critical, therefore, that all helping professionals familiarize themselves with federal, state, local, and vocational statutes and commit themselves to

adhering to these as well as the codes of ethics of their particular profession and/or place of employment regarding confidentiality.

When in supervision, clergy and other helping professionals should familiarize themselves with the legal requirements regarding gaining permission to record (audio or video) counseling sessions and the sharing of confidential information with a supervisor.

A distinction must be made between confidentiality and privileged communication. The *Dictionary of Pastoral Care and Counseling* (Hunter 2005) notes: “Simply put, confidentiality refers to privacy while privilege to the legal protection of that privacy” (p. 209). Privilege provides legal protection for persons who wish to block the release of information from a pastoral or professional conversation. Any information shared in confidence with helping professionals belongs to the person who shared it and not to the professional who heard it. Thus, all protection from disclosure belongs to the one who shared the information and not to the professional providing the care. In other words, privilege is the legal right of one seeking help who alone can waive it, whereas maintaining confidentiality is the moral and ethical obligation of a helping professional.

The complexity of the right of privileged communication should be a sober reminder, especially to religious professionals, that they stand at the juncture of tensions between religious sensibilities about clergy privilege and competing civil statutes. It behooves chaplains, clergy, pastoral counselors, and other helping professionals, therefore, to familiarize themselves thoroughly with all legal statutes and employment protocols and particular professional or vocational ethics regarding confidentiality and privileged communication. Further, they must demonstrate due diligence in being transparent with parishioners and help-seekers regarding their personal practices regarding confidentiality and privileged communication and to seek professional consultation from an appropriate supervisor or other professional when issues or procedures regarding confidentiality or privilege are not clear.

Marriage and family therapists sometimes embrace differing views and practices on confidentiality when offering couples therapy, and one partner discloses a secret about oneself or the other without the other being present. Some therapists refuse to see one partner of a dyad so as not to be put in this awkward therapeutic position. While some therapists vow to keep a secret confidential when the other is not present, other family therapists are reticent to maintain secrets revealed when the other partner is not present so as not to collude in maintaining the secret and the systemic anxiety surrounding it (Bowen 1982; Friedman 1985). It is important for clergy, pastoral counselors, and therapists to be mindful of their profession’s guidelines and their own therapeutic and ethical preferences on such matters and to embrace the highest levels of transparency by clearly communicating their particular ethical concerns and practices regarding confidentiality to help-seekers at the very onset of a professional or counseling relationship.

Since hospital chaplains are often seen as a part of a medical team and since military chaplain often come under different regulations and guidelines, they should both familiarize themselves with how their supervisors understand their role regarding confidentiality and privilege in the larger system in which they work. For example, hospital chaplains should be clear about the hospital’s expectation regarding what can and cannot be noted in medical records and charts without a patient’s permission. The hospital chaplain should be clear about what a medical team needs to know about a patient who shares personal and medical information or history solely with a chaplain, and military chaplain should acquaint themselves with protocols particular to military codes of conduct.

Confucianism

Jeffrey B. Pettis
Department of Theology, Fordham University,
New York, NY, USA

Confucius was born 552 BCE in the district of Tsau, China, during the 20th year of the reign of Emperor Ling. Little is known about his childhood. According to one myth, Confucius' mother Ch'ang-ts'ai gave birth to him in a cave on a hill as instructed in a revelatory dream experience. The child was born in the night protected by two dragons who kept watch on the left and the right
